It would have been so much easier if James Holden were only a madman.

Your empire’s hands look a lot cleaner when you get to dictate where history begins, and what parts of it don’t count.

He knew the story of Laconia’s founding. He’d been there for it, though he’d been a child at the time. The gates to the thirteen hundred worlds had opened, and the probes had gone through. They’d brought back reports of the different systems, the stars and planets, and the stranger things that they’d seen. All humanity had seen the opportunity of new lands, of new worlds to inhabit, but alone of them all Winston Duarte had recognized the terrible danger that expansion would bring. The chaos and violence as humanity pressed out past the limits of civilization. The choke point of the slow zone and the endless wars it would generate. The unanticipated

environmental collapses made worse by the lack of a central response. And he alone had the will to solve the problem.

From among all the planets on the far sides of the gates, he chose Laconia because of the orbital construction platforms. He found the live culture of the protomolecule that he could use to harness Laconia's power. He found Dr. Cortázar to lead the research and development. And he took a third of the Martian Navy as the seed that would grow to become the world tree. The fraction of humanity that would rebuild on Laconia and come forth to bring order to humanity's chaos. To bring the peace that would last forever. The end of all wars. Singh doubted none of it. Holden's version wasn't incompatible, even if it chose a different emphasis. Holden himself had used the protomolecule on Ilus—or been used by it—to turn on the ancient mechanisms. Only he had done it haphazardly, and with terrible results. Duarte had done it carefully, and to glorious effect.

He sipped his tea. It hadn't quite gone cold, but it wasn't as warm as he'd expected. Holden was a problem. He was the key to breaking the terrorist network on Medina. He was also the key to the mystery of the thing that had appeared on the *Tempest*. His was the only report on the visions from the ring station. He was singular in all humanity because he'd bumbled into being in so many of the right places at so many of the right times. If there was one thing Laconia's history taught, it was the power of the right person at the right moment.

Singh had always known that the history of Laconia and the history of Sol system were connected. He'd never felt those common roots more deeply than now. The sense that his world and Holden's were part of a single, much vaster story. The makers of the protomolecule were also a part of that larger frame. The things that had killed *them*, and then vanished.

The things that had returned.

Chapter Thirty-Nine: Amos

I was thinking about the recyclers,” Peaches said. She sounded tired. She always sounded a little tired, but this was more.

“Yeah?” he said.

They were alone in the bunk. She was sitting up, paring her toenails with a little knife he’d found for her. Something about her meds made them thicker and yellow. He knew it was important to her to keep them short, even though she never said anything.

His hands imagined what it would feel like to snap her neck. The tension first, then the grinding feeling of cartilage ripping as it gave way. He saw the look of betrayal in her eyes as the life went out of them. It was as clear as if he’d actually done it.

“The returns aren’t as good as they ought to be,” she said. “We’ve been able to get eighty-eight, ninety percent recovery, but I don’t think we broke eighty-five on the Freehold run.”

“Worth looking at,” Amos said. “You got any suspects?”

“I want to take a look at the water filters. I know they’re supposed to be the best there is without retrofitting to a straight gel system, but I don’t think they’re doing what’s on the label.”

He closed his eyes and the *Rocinante*’s recycling system appeared in his mind. If the filters were underperforming ... yeah, could throw off the pressure going into the recyclers. Might be enough to drop the reclamation percentages. He pictured what else it would do.

“We should take a peek at the feed lines,” he said.

“Look for distention?” she said.

He grunted. Peaches scowled and nodded once, the way she did when they’d come to an agreement. There were still a few things about the *Roci* that he knew better than she did, but those were few and far between. And mostly about the weapons systems. She didn’t like those, and it had an effect on how much she thought about them. There were conversations he

had with her that he couldn't have with anybody else.

That didn't keep the thoughts from coming. It didn't do anything about the thing in his throat. "You think Holden's okay?" she asked.

"Is or he isn't," Amos said. The thing in his throat got a little bigger. A little tighter. He wasn't sure why.

"I wish there was something more I could do," she said.

"Naomi'll come up with something. Whatever needs doing, we'll do it."

She finished the last nail and tossed him the knife. He caught it in the air, folded it closed, and put it under his pillow, where it would stay. Peaches got another couple of her pills and swallowed them dry, then lay back on her bunk. There wasn't room enough between her bunk and the one above her to get a decent punch going, but he knew what it would feel like to do a straight-kick to her ribs. Or her head. Push her back against the bulkhead, then the next kicks, she wouldn't be able to avoid. He wasn't going to do it, but the thoughts came anyway.

"You need some sleep?" he asked.

"Little."

"You should try to eat some afterward."

"I'm not keeping much down right now."

"That's why they call it 'try,'" he said. "Worst case, just smear it around your face like a little kid. Absorb some nutrients through your skin."

She chuckled. "You talked me into it, big guy. After I rest."

"I'm going to get a jump on it," he said. "You need anything, you just say it."

"Thank you," Peaches said.

He made his way down toward the galley, his shoulders brushing against the conduit and pipes on both sides. In the galley, one of Saba's people was drinking a cup of coffee. Nice-looking guy, always been pleasant. The thing in his throat moved a little, and Amos felt the coffee cup slamming into the other guy's face. The edge of the cup folding against the guy's upper lip. The coffee burning them both. He felt what it would be like, bending him back, trapping his legs under the table so he couldn't writhe away, pulling until his back snapped. There'd be others by then. The guy's friends. He thought about how to kill them too.

Amos smiled amiably and nodded. The guy nodded back. Amos got a bowl of oatmeal and honey flavoring. He sat by himself to eat. Saba's guy finished his drink and walked away. There was a moment when his back

was turned, Amos felt his own foot driving into the back of the man's knee, knocking him forward and down where he'd be in the right place for a choke hold. Amos only sighed and took another spoonful of grain mush. The stuff on the *Roci* was better, but this was warm anyway. It soothed his throat.

"Hey there, big guy," Babs said from the doorway.

She stepped over, sat across from him. Her jaw was set and her gaze was firm and straight-ahead. Looking right at him like she was playing at being Holden.

"Got a minute?"

Amos took his half-empty bowl, dropped the spoon in it, and threw them all away as he walked out the door.

There was an environmental-control station about seven doors down. Saba'd been using it to store food, but they'd all been eating at a pretty fair clip, and it was mostly empty space now. Only one entrance, so no one spent much time there. Thick walls filled with insulation foam. The kind that just ate up sound like it was nothing. If the Laconians came, it was a death trap. He shouldered the door open. Babs' footsteps came from behind him, hard and fast and authoritative. Like a schoolteacher about to chew out her students.

The room was dark, but he found the switch. Too-bright utility lights. They were down to half a pallet of textured protein and some tubs of grain and yeast. The walls were all steel plate except for a patch in one corner where they'd used carbon-silicate lace. A pipe ran along the corner where the ceiling met the left wall. The actual environmental controls were all in locked cabinets and behind security doors that would take a crowbar, a welding torch, and a couple hours to get through. The whole place was maybe three meters by four, and a couple high. It wasn't perfect, but it was pretty good. He didn't have anyplace better.

Babs stepped in behind him and closed the door. Her nose had the two little half-moons beside the nostrils that she got when she was pissed. The thing in his throat throbbed like a tumor. For a second, he thought it was maybe going to rupture.

Babs crossed her arms, blocking the door.

"Look, Amos. I understand you're pissed off at me. And honest to God, I'm more than a little pissed off at you right now too. But we're a crew. We're friends, and we can work this out, whatever it is. I'm here, okay? So

whatever it is—”

“When did you turn into such a fucking pussy, Babs?” he said. His hands were tingling like they had too much energy in them. Like he was about to ground out. “Did you really come in here to talk about your feelings?”

Her face went blank, her eyes flat. She uncrossed her arms. Her weight sunk into her hips. Her knees bent a little. He figured she was good for maybe one or two more rounds of insults, but he’d gauged wrong.

She shifted her shoulders, swung at the hips, her right arm unfurling. A few years earlier, he might have been able to slip it and get inside. But a few years earlier, she might have been faster. Either way, all he managed was to turn his head away and pull back a couple centimeters before her knuckles slapped into his cheekbone. If he’d been slower, it would have splashed his nose across his face. Her next punch was already coming, and he turned so that it got his shoulder at an angle. The pain was sudden and wide and familiar as an old song. He felt this thing in his throat blowing up like a balloon, expanding out bigger than he was.

He kicked straight, hitting just above her hip with his knee still bent. It wasn’t to break her but to push her back, then with the room he’d opened between them, he rushed her. Right fist to her face, left swinging up into her ribs. She lifted her arms into a boxer’s stance, but a fraction of a second too late. He finally got inside her guard, his right elbow across her throat, and he had her back against the door. Pushing against her windpipe. She shifted under him, looking for a way to get a breath. His legs and back ached with the effort of closing her throat for her. He gritted his teeth until they creaked.

The pain in his balls started with a thump like hearing someone drop a brick, then a second later the brightness came, spreading out through his whole body. He felt himself stumble back. Bobbie turned out from under his arm, hitting him once with each fist on exactly the same rib. He felt it give.

She wasn’t pulling her punches. She meant it. He let go of the last shred of restraint, and surged forward, roaring. Ready to kill or get killed. The tiny part of him that was still watching him, still thinking and aware, expected her to flinch back. Instead, she jumped in toward him. They hit like a wreck, her hand on his neck, her hip against his, and he was in the air. He hit the bulkhead hard enough that sound faded away for a second. He

pushed off just as she swung a knee into his gut, grabbed her around the thigh, and lifted, swinging her up over his head, and then both of them down to the deck as hard as the spin gravity would take them.

Someone was shouting, and it might have been him. It was all ground game now, and her hands were on his head, fingertips digging into his skin, looking for a grip. If she got his ear, she was keeping it. He reared back, grabbing for her arm, trying to get her elbow where he could bend it back. Snap it. For a second, he was almost there, but she twisted, got a foot against his waist, pushed him back. He caught her ankle and tried the same move on her knee, but the muscles there were too strong, the joint too solid to break. And while he was trying it, he couldn't move as well.

Her other heel came down on his left eyebrow, popping it open. He pushed in toward her, driving her back. The blood stung his eye, but he moved fast and with a lifetime of practice. He had his hands around her throat, squeezing as hard as he could. Her windpipe was between his thumbs where he could crack it like a walnut—

Except she was already bringing her arms up inside his, rolling her shoulders and shrugging off his grip. She'd planned it. She wasn't lost in rage haze. She was still thinking.

She locked her legs with his, and rolled so she was on top. The heel of her left hand pushed his chin up and away so her right fist could land on his throat. Amos coughed, tried to roll away. His breath was a thick wheeze. The air that made it into his lungs felt pressed thin. He struggled to get to his feet, but she was already up, kicking his knee out from under him. He hit the deck hard. She was over him, kicking down. Curb-stomping him. He tried to curl away from her. Her heel hit his shoulder, his back. She was going for his kidneys, and he tried to shift away, but he couldn't. The pain was exquisite and vast. He was helpless. He was fucked. She kicked him again, the whole weight of her body behind it, and he felt another rib go.

He wasn't going to make it up. The violence was going to go on until she decided it was over, and there was nothing he could do to make it stop. He curled against blow after blow after blow, felt the damage in his body getting deeper. There was nothing he could do to defend himself. If Bobbie wanted him dead, he'd die.

He endured, helpless. The pain smeared into itself until it wasn't any part of him that hurt. Until it was bigger than his body.

His mind slipped, shifted. Images flickered through him like a memory

too deep to bother being coherent. A perfume smell like lilacs and bergamot. A white blanket so used that the cotton fibers were shattering, but soft. The way the cheap ice pops they sold at the shitty little bodega at Carey and Lombard tasted. The sound of a feed in the next room, of rain. It had been a long time since he'd thought about how the rain sounded in Baltimore. Violence, helpless pain, but cheap ice pops too.

A deep peace welled up in his gut, flowing out through him, lifting him up and out of his body. He relaxed into it. The thing in his throat was gone. Or no. That was never going to happen. It was sated. Back in the deep place where it belonged. He felt like the moment after orgasm, only better. Deeper. More real.

Eventually, he noticed Bobbie wasn't kicking him anymore. He rolled onto his back. Opened his eyes. There was blood on the bulkheads and the deck. His testicles felt like soccer balls made of agony. Drying blood glued his left eye closed. His throat ached and burned when he swallowed, but the thing was gone. Something was weird about his breathing, though. It took him a second to figure out what. It was that he wasn't the only one wheezing.

Bobbie sat with her back against the door. Her legs were spread a little, taking up the space. Her hands were on her knees. The little bleeding divots where the skin over her knuckles had split looked like art. Her hair was plastered to her neck. Mostly by sweat.

He looked at her looking back at him. Neither one of them spoke for a while. The hum of the station was the only sound.

"So," Bobbie said, then took another couple breaths before she went on. "The fuck was that?"

Amos swallowed. It hurt a little less this time. He tried to sit up, then thought better of it. There were even a few spatters of blood on the ceiling. One of them looked a little like a cartoon dog face.

"I don't," he said, then gulped in another breath. "I don't want things. You know what I mean?"

"Nope."

"People ... people want things. They want kids. Or they want to get famous or rich or something. And then they get all screwed up trying to get it. So I just don't want anything. Not like that."

"All right," Bobbie said.

"Only I fucked up. Didn't even know I was doing it, but it got where I

wanted a thing.” He waited for the lump to come back to his throat, and when it didn’t, he went on. “I want Peaches to get to die at home. With her family.”

“On the *Roci*,” Bobbie said. “With us.”

“Yeah, I want that. Only ever since we got back from Freehold, it’s all coming apart. It wasn’t so bad when it was just Holden and Naomi peeling off on their own, because they picked that.”

“And also they never actually went away,” Bobbie said.

“But then that big bastard came through the Laconia gate, and now we’re locked off the *Roci*, and it’s like the chance to do it right’s just slipping too far away to get a hold of it, you know? I see her acting like it’s not much one way or the other, only it is to me. And then ... then everything gets harder. I get cranky. Start thinking about shit I don’t want to think about. You know.”

They were silent for a long moment. Amos tried sitting up again, and managed it this time.

“All right,” Bobbie said. “I get it.”

“You do?”

“Close enough,” she said. “I get it close enough.”

She levered herself up to standing, then held a hand out to him. He took it, his hand on her wrist, hers on his. They pulled together and got him to standing. Her face was almost unmarked, but there were some bruises starting to show around her neck. “You really beat the shit out of me,” he said.

“Would have been easier to kill you,” Babs said, and grinned with bloody teeth. “But I feel like we still need your dumb ass.”

He nodded. She was right about both things.

“We should get you some ice,” he said.

“Fuck you,” she said. “If I did half my job, you’ll be stuffing your jock with every cold thing we have.”

“Yeah. You can have it when I’m done, though.”

She managed another bloody smile and turned toward the door.

“Hey, Babs,” he said. “No hard feelings, right?”

“Just next time you need to beat someone up, how about you don’t insult me first.”

He chuckled. It hurt. “If I need to beat someone up, I’ve got a whole station full of possibilities. But if I’m looking to *lose* a fight, I’m pretty

much down to just you.”

She took a second. “Fair point.”

It took him about five minutes to get to the head. He washed up the best he could, but he was going to need some fresh clothes, and washing his eye pulled the clot a little bit loose. It started bleeding again. He’d talk to Saba about getting someone to stitch it closed. But clothes first.

“Jesus Christ,” Peaches said when he stepped into the room. “What happened?”

“Huh? Oh, you mean this? Me and Babs were doing a little sparring. I put my face where it shouldn’t have been. It ain’t nothing.”

Her face balanced between not believing him and choosing to, despite the thinness of the lie. He looked at her collarbone, waiting for the thing to come up with some way to break it, but nothing came. So that was good.

“You need to be less rusty,” she said at last.

“That’s not wrong,” Amos said. “What’re you up to?”

“I was going to go smear some food on my mouth like a toddler,” she said.

“Sounds good,” he said. “I’ll go with you.”

Chapter Forty: Naomi

Wake up. We have to go,” someone said. “Now. Go, go, go.”

Naomi forced her eyelids open. Her feet hit the decking before the dream she’d been in loosed its grip on her mind. There had been a fire. She’d been talking to it ... she felt herself forgetting, the dream dissolving like sugar floss in water.

Amos rolled off his bunk with a grunt of pain and went to help Clarissa up. Alex was tugging his jumpsuit up over thin, brown legs. The new voice belonged to a girl too young for the split-circle tattoo on the back of her hands.

“What’s going on?” Bobbie said. “We got a problem?”

“Saba got word we need to go, so we go. Now go.”

“Where is he?” Bobbie asked.

“Gone,” the girl said, and then she was gone too. Light spilled into the bunk from the door she hadn’t closed. The voices and sounds of metal against metal were loud and panicky, but they weren’t battle. There wasn’t gunfire. The fear and the urge to motion that grabbed Naomi’s heart were still as violent.

“You good, Peaches?” Amos asked. Clarissa nodded, and pulled her hair back into a ponytail like she was getting ready to go to work. There was more color in her cheeks since she’d gotten the new medicine. If Amos hadn’t found a supply, they’d have been carrying her right now. Heaven. Small favors. Like that.

They piled out into the corridor, and Naomi paused, looked back. There were no tools, no terminals, nothing left behind but traces of hair and DNA. Which would be plenty enough to identify them.

“Naomi?” Alex said from the hall. “Everyone else is getting out mighty quick here. We should maybe—”

She moved quickly, decisively, pulling blankets and pillows and sheets up in her arms. They were cheap, so they pressed down to almost nothing.

Another small favor. She shoved them into the makeshift recycler feed at the end of the hall. Maybe it wouldn't make a difference. Maybe she'd been foolish to take the time. It didn't matter. She'd done what she'd done.

A lot of her life was like that now.

Saba was at the service doorway that led out to the rest of the station. The vast body of Medina that the underground didn't control. His jaw was tight, and there was a darkness around his eyes that the brown of his skin couldn't hide.

"What's going on?" she asked.

"Had word from one of ours in system logistics. Laconia's slated this section for survey. If they're going to find our holes here, best we not be in them."

"Well. We knew it would come."

He pressed a hand terminal into her palm. "This is yours. Cooked profile. Got one for alles la along with. Rooms, jobs. Don't scratch the chrome, it'll come off, but it's what I could do fast."

"Thank you," Bobbie said as he passed one to her.

"Messages too. Just text. And just to me. Your circle is your circle."

Naomi nodded. It felt like being young again, in all the worst ways. Amos, Alex, and Clarissa were already moving toward the common corridor, Bobbie trotting to catch up to them. Naomi put her hand on Saba's arm. "The false identities don't have to hold up long. We're close to doing this. No despair."

Saba's eyes softened. "My lady wife is back in Sol leading the fight against these bastards. And I will move worlds to wake up beside her again. Just once more."

Naomi thought of Jim, and the ache of fear in her stomach. Saba touched her shoulder, and pushed her gently away toward her friends. Her crew. Her family, less one.

The inner layer of Medina's drum could have been any of the old spin stations. Wider, common corridors with room for carts and foot traffic both, ramps that led up toward the soil and false sun of the inner face or down toward the vacuum beneath her feet. She hadn't stepped outside Saba's hidden dens since they'd lost Jim. Now, walking with the normal inhabitants of Medina, trying to fit in with the midshift patterns, she kept noticing how open everything felt. In another context, it might have been a relief. Now it left her feeling exposed as a mouse in cat territory.

She plucked up the terminal that Saba had given her, trying to look bored as she checked who she was, where she lived, all the answers she'd need to give the Laconians if she was stopped. She'd seen plenty of faked identities before, and this one was decent. The real question was how deeply Saba's moles had been able to get into the Laconian datasets. With the link between Medina and the *Storm* severed, they'd be working from local copies. Corruptible ones. Odd to think that without Jim's sacrifice, the underground might have ended right then. Her gratitude was complicated by anger.

Wide screens showed the station newsfeed. Laconian propaganda, but maybe true, some of it. They were playing images of Sol system and the war there. She didn't watch that, but when it shifted, she paused. A young woman with olive skin and a wide jaw in Laconian blues. The text below her said, ADMIRAL JAE-EUN SONG OF THE EYE OF THE TYPHOON. And on the other side of the screen, a young man. Santiago Singh, governor of Medina.

"What are your hopes for your arrival at Medina Station?" he asked, the subtitles in Spanish, Chinese, and—unnervingly—Belter Creole.

The woman nodded seriously, and answered. "The important thing is that we ensure the safety of the people on the station. High Consul Duarte has made it very, very clear that—"

Naomi didn't realize she'd stopped until Amos prodded her.

"Should probably keep moving, boss. Less attention."

"Yes," Naomi said.

"It's editing," Clarissa said. "They do it all the time. That's not what the light delay really is. There's still time."

Naomi nodded. She didn't trust herself to speak.

Her name, according to Saba's faked ID, was Ami Henders, and her address was listed as refugee housing on level four. She was supposed to be the pilot of the *Blue Genius*, a water hauler presently burning somewhere on the far side of the Athens gate without her. She wondered whether Saba had been able to scrub Naomi Nagata from the station records. He wouldn't have been able to get her out of decades of newsfeed footage, standing behind Jim and wishing the cameras were elsewhere.

She was walking on the surface of a soap bubble and hoping it wouldn't pop.

The refugee quarters, when they reached them, were a little better than living in the underground had been. A little suite of five rooms with a

narrow common hall and a shared head at the end. She could have touched one wall with her elbow and the other with her shoulder. It was tighter than their quarters on the *Roci*, but with doors, so they could sleep without breathing each other's dreams. A little monitor in the wall was set to the official newsfeed, but the captain of the *Typhoon* was gone, replaced by a sober-faced man in a security uniform.

"The base was exactly what we thought we would find. These rat holes are what allowed the terrorists to function and plan in secret. Without them, they'll be forced out into the light. That's where they can be stopped.

"We don't know how many people were using the secret base, but we've cordoned it off and we're making a full investigation. We feel certain that the threat to the station is reduced, but we can't be complacent. These people are willing to risk the integrity of the environment for their ideological purity. Risk the lives of the whole station. It's important that we isolate and disarm these terrorists before another attack like the one on the oxygen tank.

"With that in mind, the governor has authorized a limited amnesty for anyone who—"

Clarissa turned the monitor off with her thumb. She met Naomi's eyes, and the determination and exhaustion in them was clearer than words could have been. *Let it go. We have work to do.*

Alex cleared his throat. "Well, since there's no galley anymore, I guess I'll head down the hallway and see if I can't find a coffee shop or something. Anybody else need breakfast?"

There would be guards. There would be drones. There would be the risk that trying to pay for something would collapse Alex's false identity or flag his real one. She wanted to grab him and lock him in his room. She wanted to make sure no one left the uncertain safety of their cabin.

"Tea," she said. "Maybe some protein cakes."

"All right," Alex said. "I'll be back." The way he said it made it a promise. As if he could keep it.

"I'm gonna ..." Amos said, gesturing to Clarissa.

Naomi nodded. "I'll get some work done."

"That leaves me for watch," Bobbie said with a lopsided smile. "Not much of a plan, but it isn't nothing."

"I'll get you a plan," Naomi said.

Sitting alone on her new, thin bunk, she built a list on Saba's terminal. If

she thought too much about the dangers, the time pressure, she knew the dark thoughts would start coming. There wasn't time for that. If she could focus, though, problem-solve, she'd be okay. She'd known herself long enough to learn that. The care and feeding of a well-used mind.

The final goal was to get out of the slow zone and find someplace safe to hide and regroup. So the last step was at the top of the list:

REGROUP

She didn't have the details of what that would look like. Probably keep her head down and see what happened. Wait for the enemy to stumble or new allies to appear. The old, old strategies. But whatever shape it took, that was the final goal. In order for that to happen, they would have to manage some other things ...

REACH SAFETY

Before that ...

IDENTIFY SAFETY

After all, they'd need to know where they were fleeing to before they fled. It had to be someplace that they could land the *Roci*. Someplace that wasn't likely to fall in line with Duarte and turn them in. So none of Fisk's association worlds, and not Sol either. That was tricky, but she felt the beginnings of some ideas for it. So all right. But there was more than one dependency for that, so she split the column and added the other track.

BLIND MEDINA AND GATHERING STORM

If the Laconians knew where they'd gone, they wouldn't stay hidden long. So that would be important. And it would be the last thing they did before they left, so the enemy wouldn't have time to fix whatever they chose to break. She'd have to have everyone ready to go before the sensor arrays went down, so ...

GATHER EVACUATION GROUPS

And in order to do that, they'd have to get the word to everyone in Saba's networks. All the underground. All of them. And there it was. The sorrow and the fear. And the tightness at the back of her throat. It was all right. She just had to put it on her list. It was just part of the plan.

SAVE JIM

Saba sent a message an hour before “Ami Henders” was supposed to get off her shift. Bobbie got the same message, though none of the others did. It was a restaurant just one level under the drum’s inner surface and a route to reach it that would, if everything went well, avoid any checkpoints. Naomi washed her face in the little sink no wider than her two palms together and tugged her hair into something like order. When she got home to the *Roci*, she was going to spend a day in the showers. A whole damned day.

Alex and Clarissa were waiting for her in the public hall. Bobbie and Amos were a few meters down, pretending to talk, but actually keeping watch. They were both bruised, and there was a cut over Amos’ eye. They looked like they’d been caught in the explosion, which was technically true, but the tension that had been showing in the way Amos held his gut and shoulders was gone.

No, not gone. But lessened. That was good.

“We ready to paint the town red?” Clarissa asked, taking Naomi’s arm. It had the form of a playful gesture, but the need for support was there too.

“I hope this place serves margaritas,” Alex said. “It’s been a long time since I had a good margarita.”

“Trust me when I say you’ve never had a good margarita, Martian,” Amos replied. “Still some things only Earth does well.”

Bobbie caught Naomi’s eye, gave a little nod, and started off along the route. Amos walked at her side, his steps rolling a little in the fractional gravity, like something hurt with each step. Naomi gave them a few seconds, and then started after them. There was a story behind those bruises, and she had the impression she’d never know what it was.

James Holden had shipped with five others on his crew, but they weren’t five. They were a couple up ahead, and a different group of three behind. As ways to avoid pattern recognition, it was thin. But it was something.

The restaurant was a wide, white ceramic bar open to the corridor. Billows of steam came from the back, rich with the smells of fish and curry. The design didn’t fit into the aesthetic of the original ship. This space was a modification, the *Nauvoo*, which became the *Behemoth*, which became Medina Station in the process of learning what it was and would be. Looked at that way, Naomi liked the restaurant, even if it was a little ugly.

The man behind the counter nodded, greeted them all in a dialect Naomi didn’t recognize, and waved them back into the steam. The kitchen was small, with two women—one very old, the other hardly more than a girl—

who looked at them curiously as they passed through.

The old man opened a thick metal door and nodded, smiling, at the walk-in freezer beyond it. Saba was already there, a blanket over his shoulders and a thin, black cigarette in his mouth. His cheeks were ruddy with the cold. The old man closed the door behind them, and a golden emergency light came on, throwing shadows across them from crates of vat-raised fish. Amos' gaze cut over to Clarissa, but if anything she seemed to be enjoying the cold.

"Not perfect," Saba said, "but hard for them to hear us."

"You think they're listening?"

"No," Saba said. "But here, seems less likely I'm wrong. Perdón for the fast change. I didn't have much warning."

"Shikata ga nai," Naomi said, and Saba nodded ruefully.

"We have a plan," Bobbie said. "Well, Naomi does."

"The outline of one anyway," Naomi said. "I don't love it, because a lot of things have to happen in a very small time frame. But the *Typhoon* arrives in less than a week, and slowing that down isn't something I can do."

"I have people," Saba said. "You tell me, I'll tell who needs telling."

"There's just a lot of moving parts," Naomi said. "Lots of ways for things to break down."

"Tell me a story," Saba said through a cloud of smoke and visible breath.

Naomi did. She went through step by step, detail by detail. As she talked, the whole operation solidified in her mind, letting her speak with a clarity and authority she only halfway felt. It was a terrible plan, open to a thousand different failures, and some of them wouldn't be things they could recover from. If the assault team couldn't get onto the *Storm*. If the kill code was changed or unhackable. If the Laconian repair crews could get the sensors fixed more quickly than she expected.

But with every word she spoke, with every detail she provided, she felt the *Typhoon* looming behind her. Coming close. Ending any chance they had.

"Gonya need two bombs," Saba said, pulling up his hand terminal. The one that didn't connect to the station's legitimate network. He talked as he composed a message. "One for sensors, one for the jail. Katria's good for one. Have to see who she likes for two. Which one matters more?"

They both matter, Naomi said at the same moment Clarissa said, *The*

jail.

"I worked on this station, back in the day," Clarissa said. "Get me access to the secondary power junction that feeds them and a way to reset the primary. I can keep the sensors down."

"Claire," Bobbie said, concern in her voice.

"I'm good for it," Clarissa said. "It will work."

And then that was decided. Saba was already putting a message into his hand terminal.

"Bist bien alles," he said.

"Amos and I are dealing with the *Storm*," Bobbie said. "You give us a team, but we're point or no deal."

"Deal," Saba said. "I'll put me and mine on the *Malaclypse* as soon as the signal goes. If the muscle here has trouble, at least there can be two against the one. Plan B, sa sa?"

Alex raised his hand. "No one's flying the *Roci* on this but me. We all knew that, right?"

"I'll take the jail," Naomi said. *I'll get Jim.*

Saba's terminal chirped, and he looked at it with pleasure. "Katria has someone. Coyo with experience in demolitions. He'll need to know what we're doing. Just his part, though. Inner circle, us."

"Inner circle," Naomi said. "Claire and I can meet with him."

"Good," Saba said as he trundled to the freezer door and pounded on it with a blanket-wrapped fist. Then he pointed to Bobbie and Amos. "You come with me. We'll see Katria. Talk about how to hunt Marines."

Something flickered over Bobbie's face. Hardly even an expression, but Naomi saw it.

"You lead, we'll follow," Amos said, smiling his empty smile.

"Any thoughts on how to get me onto my ship?" Alex asked as the door opened.

"Several," Saba said. "You should come with." Then he shook his head. "Too many things. Not enough time."

They stepped out into the suddenly burning air. Naomi hadn't even noticed she was getting cold until suddenly she wasn't anymore. Saba led them out to the kitchen, and then they slipped through the steam and into the civilian world two by two until she and Clarissa were all that remained.

They sat at the counter and watched people go by. The fish was unremarkable, but the curry and mushroom rice actually were good. Across

the corridor, a monitor spooled out the newsfeed until it repeated. Clarissa ate, drank tea, talked about everything and nothing. Naomi almost didn't notice the tremble in the other woman's hand or the way her eyes jittered sometimes. *If she thinks she can do it, she can do it*, Naomi told herself.

The man arrived, sliding into the chair beside them. Dark, handsome eyes and a bright, excited smile with a crooked nose between them. "Namnae na Jordao," he said. "Seen you both back at home, yeah?"

"I remember," Clarissa said.

"Katria, she sent me," he said, then leaned forward. "So what is it we're going to do?"

Chapter Forty-One: Singh

He had trained on ships back home, as anyone at his rank would. He'd spent weeks sleeping in a tight cabin and eating elbow to elbow with his fellow officers, but at the end of training, he went home, back to Laconia and Natalia and the monster. The weekends after a training run had been some of the best he'd ever had, waking up late with Natalia beside him. Before the monster came, they'd had quarters with a bedroom on the third story and a folding wall that they could pull back to get fresh air and the view. He remembered lying in that bed, looking out over the city as twilight fell. Vast clouds turning gold and violet on the horizon, and the alien construction platforms glittering among the stars.

He'd laid his head against Natalia's as-yet-unoccupied belly and thought about the ships being made up above the planet's atmosphere. How one day, he might command one. It had seemed glorious at the time.

He'd known without checking the dates when his exile on Medina Station had lasted as long as a full training tour. Something in the back of his mind had been anticipating the end of low ceilings and false skies. Each day, he found himself growing more anxious, and it wasn't only the threat from local terrorists or the mounting pressure he felt to reopen the traffic through the gates. It was his flesh itself, grown accustomed to these long isolations having an end, expecting relief and not getting it. Wanting his wife and his child and their sky, even as his conscious mind knew the first two would come much later, and the last ... perhaps never.

It was possible that he would live his whole life and die as the governor of Medina Station and never see a real cloud again. He'd known that from the moment he'd met with the high consul, all those months ago. It hadn't started chafing until just now.

The draft of his monthly report was open on his monitor, his personal journal inset in a smaller window. Everyone above him in the chain of command could see his journal if they chose to, but his report gave him the

chance to summarize his experiences. To say what, from his perspective, was important. His fingers hovered over his keyboard, where they had been since the memory of Natalia and their old bedroom and the clouds had intruded on his thoughts. He wished he could pause longer.

Many of the locals persist in referring to the transfer of control in Sol system as a war. This kind of rhetoric has emboldened dissident factions on Medina Station. Given the escalating violence employed by the dissidents, I have elected to maintain the closed-gate policy until the arrival of the Typhoon. Ships coming in from colonial systems have too great a potential to smuggle in relief supplies and reinforcements for the recalcitrant elements here.

He paused again. A small, angry voice in the back of his mind said, *In the event of another large-scale attack on the station, I recommend pulling Laconian forces back to the Storm and venting Medina Station.* He pushed the thought away without writing it down. It wasn't only that it was immoral, though that should have been enough. It was also a statement of weakness. An admission that he could not cut the rot out of this tree without burning it all. And still, the elegance of it made it hard to turn away.

If Holden and his allies had been held to truly Laconian standards, they would be dead. It was that simple. If Singh treated them with the respect and dignity with which Duarte treated him—to which Singh held himself—removing them all from the equation would just be proper discipline. But he had grown to understand that they weren't Laconian. Not yet. They hadn't had time to understand the necessity of the empire. Holden's arguments were more than proof of that.

He had to be patient with them. Firm, but patient. He had to keep them from hurting themselves or others until the ripples of this admittedly vast change had calmed. Until the new patterns of life had become normal for them.

While I am certain that James Holden knows more of the local dissident factions than he is presently admitting, he is not our only resource on that matter. His experience and expertise in the anomaly that Admiral Trejo reported make him a genuinely unique asset on that issue. For that reason, I have chosen to break off his interrogation here and remove him immediately to Laconia for debriefing in whatever context the high consul considers most appropriate.

Meaning that the terrorist figurehead would see Laconia before he did.

Might even come across Natalia and the monster before they came out to Medina, if the high consul chose to treat him gently. Holden would smell the rain. See the sunrise. And Singh would be here, in this spinning can in an eerie non-space that didn't even have stars to make it feel like home. It was a deep irony that being a prisoner and being in power could be so mismatched.

"Damn it," he said to his empty office, then leaned back, running one hand across his scalp. There was so much more to put into the report. The preparations he'd made—was making—for the stationing of the *Typhoon* and the additional personnel that it was bringing to Medina. The victories he'd had in rooting out the bombers and repairing the damage they had done. His schedule for coordinating and controlling the traffic between the worlds. The empire would succeed or fail on the back of its logistical planning, and his implementation of the high consul's vision was actually quite detailed. Only just now, something itched in his soul, and he couldn't concentrate.

He wondered whether Duarte ever suffered the same base animal distractions. It seemed he would have, but Singh couldn't imagine it. He closed the draft report, opened his personal journal wide enough to edit, and then closed it too. The walls themselves seemed to push the air at him. It was like an optical illusion of something falling that never quite fell.

"Damn it," he said again, less forcefully this time.

The reports coming in from Sol were distracting too. Trejo's private reports tracked through the *Gathering Storm*, but they were meant for Duarte. Singh wished he could read them himself. There were so many questions—whether the *Tempest* had taken any lasting damage in its first foray against the enemy. Whether anything had changed with the anomaly that had appeared after Pallas. When Trejo anticipated the next battle would come. And if he believed it would be the last one.

There were the public feeds, of course. The positions of the combined navies were, for the most part, a known thing. The larger cruisers were impossible to hide, and the massive union ships they called void cities. But there might be stealth ships lying in wait or fields of torpedoes launched into a quiet orbit, counting on the vastness of space to conceal them until they burned to life. Just looking at the declassified tactical map made Singh's flesh crawl. The vast cloud of the enemy shifting through the gravity-bent space of inner planets, like a swarm of insects with a single,

hated enemy. And the *Tempest* alone in its simple course. Trejo wouldn't evade and he wouldn't retreat. He had his orders, and he would follow them.

Singh reminded himself of how powerful the *Tempest* was. How resilient. The high consul wouldn't have committed the ship to a path that led to embarrassment for the empire and death for Trejo. And yet, what if he'd miscalculated? Or what if Earth or Mars or the union had been behind the wave of lost time? Or ...

This speculation was pointless. Worse, it was self-indulgent. Even if he knew everything else he needed to put into his official report, it was going to have to wait. He had to get out of his offices, if only for a while. He had to collect himself.

Overstreet answered the connection request almost at once. "Governor?"

"I will need a security detail to my office at once."

Overstreet's silence was less than a heartbeat. "Is there a problem, sir?"

"No. I want to inspect the docks. When will there be sufficient security for that?"

If Overstreet was surprised or annoyed, there was no sign of it in his voice. "I'll have a detail to you in five minutes, sir."

"Thank you," Singh said, then dropped the connection.

The *Lightbreaker* was a cargo ship that had been in the union's fleet. A small vessel, but fast and with an efficient drive. All of the ships and their crews were guests of the empire until the *Typhoon* arrived. But not the *Lightbreaker*. Of all the ships on the station manifest, that was the one best suited to act as a prisoner transport. It was slated to push off in half an hour's time with James Holden in its brig and a crew Singh had chosen from the *Gathering Storm*. And Singh found he very much wanted to be there when the first ship left Medina Station for Laconia. The first transit to happen while he was in charge of the ring space. His watch.

He straightened his uniform and checked himself in the mirror before stepping smartly into the outer offices. He heard the change when he walked into the room. The men and women under his command making certain that he saw them busy. Eight Marines in armor were waiting outside, along with a driver, who wasn't in power armor but did carry an assault rifle beside her in the cart.

"The docks, sir?" the driver asked.

"Berth K-eighteen," Singh said, then sat back as the cart started off.

The Marine escort loped along as fast as the cart could drive and with the sense that they weren't anywhere near an uncomfortable pace. The hallway had been cleared, and guards stood at the intersections with weapons drawn. It was like traveling through the dream of a tube station that had grown out in all directions until there wasn't even the promise of finding a way up to the surface. A woman with a heart-shaped face peered past the guard's shoulder, straining to catch a glimpse of him, and Singh waved at her. Let the civilians see that their governor was here, not hiding away in his office. If he wasn't scared of the terrorists, the loyal faction of the population wouldn't be either. Or less so, anyway.

And still, he did wonder how many of those people he passed would have been as happy to see him dead. He wondered if the girl with the heart-shaped face would have shot him if she'd had the chance. There was no way to be certain. Would never be a way to be totally certain. Or at least no way other than ...

At the end of the drum, they left the spin gravity behind. The Marines shifted gracefully into a protective star formation with him at its center. He had seen images of the terrorists' attack—twisted metal and shattered ceramic. Flakes of carbon lace floating in the air like black snow. Passing through the space now, what struck him was the stink of it. Welding torches and burning lubricant oil, overheated wiring and the back-of-the-throat bitterness of exhausted fire suppressants.

They did this to their own station, just to spite me, he thought. And then *No, not their own. Mine. This more than anything else proves they can't be trusted with the future. This station is mine.*

They passed by the crowd of people waiting for permission to visit their ships, the Marines alert for any sign of violence, and passed by without so much as a scowl. At the berth, the guards held Holden at the airlock, assuming that Singh had come because he wanted to inspect the prisoner before he left. On the float, Holden looked younger. The lines in his face softened, and his hair stood wildly out from his head. He could see what the man had looked like as a boy.

Singh nodded.

"Governor," Holden said. He made it just polite enough to make it clear he was impatient without actually demanding offense be taken.

"Captain Holden. I wish you a safe journey."

"Thanks."

“Laconia is a beautiful place.”

“Not sure I’m going to be seeing the nice parts of it, but I’m open for a pleasant surprise.”

“If you cooperate with the high consul, you will be treated well,” Singh said. “We are an honorable people. No matter what you think, we were never your enemy.”

Holden’s smile was weary. “Okay.” *That’s bullshit, but I’m too tired to fight about it.*

Singh nodded, and the guards guided the prisoner away. The airlock closed behind him.

Fifteen minutes later, the *Lightbreaker* left dock and burned hard for the Laconia gate with Holden aboard.

Singh heard Overstreet’s report in the security office rather than his own. The walls were a pleasantly neutral gray-green that matched everything. The only decorations were a small potted fern and a framed piece of calligraphy in red, black, and gold that listed the high consul’s Nine Moral Tenets.

Overstreet himself sat behind his desk with a physical solidity that made it seem like he’d grown there. Singh stood looking down at the man rather than take the seat and posture of a visitor. It might be Overstreet’s office, but it was all Singh’s station.

“I’m expecting some unrest after the news comes back from Sol,” Overstreet said. “People don’t like seeing their team lose. I’m trying to get ahead of that. Channel it into something we can control. Not let it turn into something that can gain momentum.”

“That’s wise. Are you seeing a reaction to the news about the underground losing their hiding place?”

“Not among the general population, no. But it meant a lot to the security force. We knew it was here someplace, but actually finding the hub and shutting it down? It’s a major step forward. Without a physically isolated space, it’s harder for the terrorists to coordinate. And it lets us move into the next phase. Identification.”

“How many have you found?” Singh asked.

Overstreet spread his massive hands. “Fifteen for certain. Maybe twenty. The level of internal corruption within the local population can’t be understated. My best estimate is that a third of our operating personnel are at least open to working against us.”

Singh let the assessment sit for a moment, watching his outrage at the ingratitude and arrogance of the locals flare like it was happening outside himself. When he was sure he wouldn’t curse, he spoke.

“That’s unacceptable,” Singh said. “Changing that has to be a top priority.”

“Didn’t mean to suggest I was accepting it. Just reporting in on where it stood. I’ve put in double and triple checks, random audits, all the internal security procedures I can, but this is going to be something we struggle with until we start getting regular commerce open again. Once we can start breaking up the old guard here, I expect to see these problems fall away. Wash out the bad, bring in the new. Like that.”

Singh made a small sound of acknowledgment, neither approval nor condemnation.

“The dock attack was what led us to their nest,” Overstreet said. “But even there, I’m fairly sure some information isn’t getting passed up the chain to us.”

“And where do we stand on that investigation?”

Overstreet’s ice-blue eyes looked away.

“Permission to speak freely, Governor?”

“Granted.”

“It’d be going a lot better if you hadn’t shipped my best resource back home. Holden was central to the conspiracy. The man’s a murderer. And I’m still not a hundred percent certain what the aim of the attack was.”

“To damage the *Storm* while it was still in dock,” Singh said.

“Maybe,” Overstreet said. “But why? In preparation for something? Or was it to degrade the oxygen supply and force us to open shipping before we’re ready? Or was it to destroy the air gap server, or the secondary power storage, or one of the eight warehouses that got scraped out by the blast? Or was it just a propaganda move to make Laconian rule look weak? Or provoke a crackdown as a way to recruit new insurgents?”

“It did all of those things,” Singh said.

“But which ones it *intended* matters, sir. Understanding the mind of the enemy is what lets me do my job.”

Singh heard the frustration in Overstreet's tone. That was fair. Part of his error in removing Tanaka had been putting Overstreet into position without the training and preparation time he should have had. And with the underground running circles around them, the man couldn't feel he was doing a good job. Nothing degraded morale like the sense that the potential for excellence was being denied.

Happily, Singh was in a position to address that point right away. He took out his hand terminal, opened the message that had occasioned this particular visit, took off his personal security encryption and passed it to Overstreet. The young man appeared on Overstreet's monitor. Wide, slightly feverish eyes, unruly hair. The lens and the perspective made the bent nose seem larger than it actually was.

"Hoy, bossmang. Something big going down," Jordao said, "I only got my part, but it's about the sensor arrays. Parley, tu y mé, aber keep it quiet. Voltaire finds out I know you, and you'll see my water in your faucets, yeah?"

Overstreet's eyes narrowed to slivers of ice. His lips had thinned to a single dark line.

"Well, that's interesting," he said.

"The Belters aren't the only ones with a network," Singh said. "Not anymore. See that your debriefing isn't observed. This time, we'll be ahead of the bastards."

"May mean pulling personnel off the engineering investigation," Overstreet said.

"This is the most important thing now," Singh said.

Overstreet nodded slowly, lost in thoughts and calculations of his own. When he sighed, it was like a dying man's breath. "We're holding this station with just the crew we carried out here on the *Gathering Storm* and a few extras that Admiral Trejo could spare us. And this station is a damn lot bigger than our ship was."

"Is that a problem for you, Overstreet?"

"It's just that we do have a great selection of number-one priorities. Don't we, sir?"

Chapter Forty-Two: Drummer

“... and if you fail to turn back,” Secretary-General Li said, “we will be forced to respond with force. There will be no further warnings.”

“He looks good,” Lafflin said. “Statesman-like.”

Drummer thought he looked sad, which actually came off pretty well, all things considered. It made it seem as if it was the impending loss of life that had dragged his spirits down. She was fairly certain that if she’d done the announcement, it would have come off as anger. Or fear. Or a near-psychosis-inducing lack of sleep.

She went back in the spooled message and watched it again. The line had been drawn where everyone had known it would. Point Leuctra, 2.1 AU from the sun. By conventions of mining law and centuries of precedent, that placed the *Heart of the Tempest* inside the asteroid belt. An invisible line in space, unmarked by anything more than what people believed about it. And that was enough.

The combined fleet of the EMC and her union hadn’t played coy. They had burned and braked to reach this position. Two hundred and thirty-seven ships, ranging from the void cities to traffic-control skiffs. Anything with a gun was spread across the surface of a modified parabola with one focus on the *Tempest*’s flight path. The ships on her side might shift and evade, but everything the secretary-general had said was for the newsfeeds and posterity. Anyone with a map and half a semester of military history could have drawn accurate conclusions without him.

She wondered if Saba would see it, back on Medina. She wondered if he was still alive. There hadn’t been a reply to her desperate question about the time slip, and the *Tempest* showed every sign of ignoring the EMC’s warning. Drummer went from optimism that Cameron Tur was right—that the Laconians wouldn’t dare use their magnetic matter-ripping beam for fear of its mysterious side effects—to expecting time to stutter, stop, and come back with the fleet already in ruins.

If she died here, would Saba see it? Would the official Laconian

newsfeeds be how they said goodbye?

Lafflin changed the display to the tactical map—the hundreds of green dots that were their fleet including the one that was People’s Home. The single orange blip that was their doom. As a piece of abstract art, it looked like something a student would have come up with at lower university. If she’d ever thought to put together a visual display that said *destined to fail*, it would have been that small, glowing bit of orange.

But still ...

Somewhere, when she’d still been working security contracts, she’d seen an interview with an old, smiling imam, whose name she didn’t remember. The one thing he’d said that stuck with her was, *I am a human being. Anything that happens to human beings could happen to me*. One time and another in the years since, she’d taken comfort from that. Or warning. People fall in love, so maybe I will too. People get jobs, so maybe I will too. And people get sick. People have accidents. And now, she supposed, people are divided from their families by war and history. And so that could happen to me too. Even when they won, would it mean she would wake up beside Saba again? There were so many variations of victory and loss.

“They’re confident, aren’t they?” Lafflin said, leaning back in his chair. “It’s astounding.”

“I suppose it is,” she said. She didn’t know where his mind had been, but it had clearly been somewhere different from her own. “You should probably get to the transport.”

Lafflin’s smile was rueful. “Is there anything you’d like me to pass on?”

“No,” Drummer said. “Anything that needs saying, I’ll say after.”

Or, she didn’t say, *not at all*. That part was understood.

As with Pallas Station and Independence, the plan was to evacuate the civilian population before the violence began. Ships had been docking with People’s Home for days now, hauling off families that had lived there for years and taking them to Mars and Earth, Luna and the Lagrange stations, or any of the thousand little holes in the Belt that could still hold air. Going to the docks with Lafflin now was like walking through a graveyard. The wide, curving halls should have been filled with people. Music and voices should have echoed down through the common parks, the transfer tubes, the docks. Even the air smelled different—closer and musty as the recyclers shifted down to match their reduced loads.

She gave Lafflin points for waiting until near the end. Most of the EMC political types in his staff had been among the first out, just after families with children. The lines of refugees waiting to leave were all older people now. The staff and citizenry that didn't have the skills to help in a battle, all with small bags floating beside them. Overnight bags, many of them. As if they might be coming right back. There was a lot of laughter in the line, and a sense of anticipation that bordered on feverish.

Part of her wanted to stop, to shake hands, to take a little of that bright, jittering energy for herself, but Drummer and Lafflin didn't pause. There was still some decorum that came with rank. The executive waiting area was well appointed with bulbs of coffee or liquor, living plants in wall gardens, soft music and LEDs that matched the spectrum of the morning light in early spring. Or so they told her. It wasn't as if *spring* were a concept with any practical existence in her life. It was nice, anyway.

Avasarala floated in a white sari with a golden sash. Drummer admired the old woman's ability to wear it and remain decent. It wasn't something a lot of Earthers could manage.

She touched Lafflin's shoulder. "You'll excuse me?"

"Of course, Madam President," he said. "I look forward to seeing you at the post-action debrief."

"You too," Drummer said.

Avasarala nodded as Drummer slid close, braced on a handhold to kill her momentum.

"You're leaving too?" Avasarala asked, her voice carefully neutral.

"No," Drummer said. "I live here."

"You're a fucking idiot," the old woman sighed, "but you'd be one if you left too. It'd be a better world if there was always at least one right answer instead of a basket of fucked."

"Are you all right?" Drummer asked.

Avasarala waved the comment away, then reached out to the handhold to steady herself. "I'm trying to decide if we're absolutely certain to lose or absolutely certain to win," she said. "I change my mind every ten minutes or so."

"It's one ship that hasn't been able to resupply in weeks," Drummer said. "It's already been through a battle. And that turning-off-people's-minds-for-a-while thing it did, we're ready for it this time. The automated systems have their governors off. We may have to get clever before the next

one shows up, but no matter what happens, we'll keep firing until *that* thing is a cloud of complex molecules and regret."

"And because it's this ten minutes," Avasarala said, "I find that argument persuasive. Next one, I'm going to remember that Duarte sent it, and then I'll get scared." She shook her head. "Who knows? The son of a bitch has been off in his own private system since before the Free Navy got their nuts handed to them. And it's pretty clear he's been rubbing up against whatever artifacts he found there. Maybe it made him stupid."

"Doesn't change what we have to do," Drummer said.

"It doesn't," Avasarala agreed. "I hate this part. You have a clear succession? Santos-Baca went down with her ship too, and even if you turn that ugly motherfucker of a ship to slag, one of the EMC bastards is as likely to throw something the wrong direction. If this goes badly, the last thing we're going to need is a long, angry committee meeting with everyone saying they've got the conch."

Drummer felt a blaze of annoyance, but pushed it down. The old woman wasn't trying to be insulting. She was just flailing around trying to find something she still had control over.

"We have bylaws," Drummer said. "And it won't matter. If I eat a stray torpedo, Albin Nazari takes over."

"That whiner? He's just gotten used to Santos-Baca's chair, and then to get yours too? He'd be like a five-year-old driving a mech loader."

"I'll be dead," Drummer said. "So I won't give a fuck."

Avasarala's laugh was short, surprised, and joyful. "I don't hate you, Camina. I hate almost everyone these days, but I don't hate you."

"I'm not planning to put Nazari in charge," Drummer said. "I'm planning to win."

In the scheme of the battle, People's Home was many things: battleship, medical facility, port, and resupply. It was all the things a city could be. In the display, it was slightly paler than the other green dots that were its fellows. Guard of Passage had a position that mirrored it. The two great cities of the union with their drums spun down, burning into the fight as anchors for the fleet. Cities that had become battleships.

“Coffee?” Vaughn asked, and Drummer waved him away.

The control room was lit like a theater—dim and warm with the tactical display in a multinetworked holographic output. Drummer had been in other battles. She had studied more than that. She had never seen more firepower leveled at a single target. She was fairly certain it had never happened before.

She strapped herself into her crash couch, checked the juice. The chances were very slim that People’s Home would go on the burn, but if it did, she’d be ready. The whole sphere of battle was less than three light-seconds across. Eight hundred and fifty thousand kilometers from the two most distant ships in the EMC fleet, a balloon holding three hundred quadrillion cubic kilometers of nothing, with a few hundred ships dotting its skin. If she’d been in a vac suit, the drive plumes of the navy would have been invisible among the stars. It was the most tightly formed major battle in decades—maybe ever—and she wouldn’t have been able to see her nearest ally with her naked eye.

“The enemy’s crossed Leuctra Point,” the weapons tech said, his voice calm.

“Are the EMC ships opening fire?”

“They are, ma’am.”

“Then let’s do too,” she said.

She wanted there to be a throb of rail guns, the chatter of PDC fire, but People’s Home was a huge structure. Even as her display told her that the rail guns were firing, the room was silent. Hundreds of other ships were doing the same thing at the same moment. Tens of thousands of tungsten slugs moving at a nontrivial fraction of *c*. It would be less than a minute before they converged on the *Tempest*, staggered and spread to make dodging difficult. But not impossible.

“And the enemy is evading,” the sensor tech reported, her voice sharp.

“Do we have visual?”

In answer, she put up the live feed. A second’s delay. Maybe two. Hardly anything at all. They were so close, they could have spoken in real time. It made her feel uncomfortable to be so near the *Tempest*. But there it was, its weirdly organic shape bright in the enhanced colors. Jets of reaction mass gouted from one side, pushing the ship to a slightly different course.

“Correcting for new vector,” the weapons station said. “And firing. EMC forces are also launching torpedoes.”

“Do the same,” Drummer said. She checked the time. Three minutes had passed. She took control of the visual display, zooming in on the skin of the enemy ship. It didn’t look like it had plating so much as a single, textured surface. She threw on the tactical overlay, and a dozen points appeared that weren’t visible in reality. The high-value targets, the vulnerable places on the *Tempest* that didn’t grow back, or at least not quickly. A dozen carefully placed dots that Emily Santos-Baca and Independence had died to find.

“Come on,” she said, willing the missiles to strike.

“The enemy is firing PDCs,” the sensor tech said.

“Show me,” Drummer said, and the *Tempest* almost vanished in a cloud of tracers. The data field was too rich to comprehend—missiles, streams of PDC fire, the straight-line paths of the rail-gun rounds.

“EMC Battleship *Frederick Lewis* is reporting damage,” Vaughn said.

“Are you working comms now?” Drummer asked. “Who’s going to get me my coffee?”

“They’re dropping core,” Vaughn said, ignoring her.

A little cheer went up, and it took Drummer half a second to see why. One of the hardpoints on the *Tempest* was blinking—the system reporting a missile strike that had connected with the target. The cloud of PDC fire grew a degree thinner. Any ship Drummer knew, any station she’d ever heard of, would have been reduced to slivers of metal and flakes of lace by now. The only thing she could think of that would withstand that barrage was a planet. Even then, cities would have been pounded to dust by what had been launched in the last fifteen minutes. Sixteen now. It was so fast. There should have been hours between launch and response. But this wasn’t that kind of battle. There was no finesse to it. Just brutal, constant violence.

The tightness in her throat was the memory of Pallas. The harder they pushed the *Tempest*, the more Drummer feared the magnetic beam. If the Laconians used it on People’s Home, she wouldn’t live long enough to notice she was being ripped apart. And if the glitch happened again ... well, the observatories on Earth and Mars might get more data about how long it took the enemy to recharge the damned thing.

But they hadn’t used it yet. Maybe the time slip had been the fucking thing breaking. The universe owed her a little slice of luck like that.

Another two hits on the *Tempest*. It shifted, plumes of steam appearing from its thrusters as it evaded incoming fire. Five more of the EMC ships took crippling damage or turned to bright dust, too far away to see. The

Tempest veered and danced. Dark streaks marked its sides where the missiles and rail-gun rounds hit, and while most of the marks faded, not all of them did.

“We have expended two-thirds of our rail-gun ammunition,” the weapons tech announced. “Shall I maintain fire?”

“Yes,” Drummer said. “Then start putting chairs in the launcher. We hit that thing until we’re down to pillows and beer.”

“Understood, ma’am,” the weapons tech said. She could hear the smile in his voice. She felt it too—the giddy sense that even if they were winning ugly, they were at least winning.

On the display, the *Tempest* shifted and dodged like a fish in a tank. The organic curves of its design made it hard not to think of it as an animal. An apex predator surprised to find itself outmatched by its prey. And there was something ...

“On the aft. By that third contact point. Is that a gas plume?”

The sensors tech shifted through half a dozen slices of the spectrum in less than a second. “That is correct, ma’am. The *Tempest* appears to be venting atmosphere.”

“EMC *Governor Knight* is launching high-yield nuclear torpedoes,” Vaughn said.

Drummer sat back in her crash couch. Anticipation was a tightness in her throat and her hands. The *Tempest*’s PDCs weren’t all disabled. There was still the chance it might kill the nukes before they got close enough to detonate. Seconds stretched into minutes. Her neck ached from straining toward the display.

The light of the explosion whited out the sensor array. A ragged cheer came from all around the control room.

“One down,” she said to herself. “And fuck you all along with it.”

It wasn’t over. Laconia would send another ship after this one. A fleet, next time. The union and the EMC would have to get much more clever. But they knew more now—about how the enemy ships functioned, how they maneuvered in battle, and most important of all, how they could be killed.

And she had to expect reprisals. By deciding to send her one last, desperate message, she had as good as told the Laconians that she still had allies on Medina. The choice had seemed like the right and obvious thing at the time. She’d pointed at Medina and said, *Look for my people here*. It

might be the thing that killed Saba and his crew.

It was a problem for another day. A tragedy she'd face when she could do something about it, and not before. There was too much that had to be done here and now.

"Send the return signal to all the transport ships and get the docks ready to bring everyone home," she said. "It's going to be a long couple weeks, people. We may as well get to it."

Another cheer, this one louder. They'd all been so hungry for a win, they were drunk with it. She was too.

"Ma'am?" the sensor tech said, the word like a drop of ice in a sauna.

The sensors had finished their reset. The *Tempest* was still where it had been, not scattered into atoms. An eerie blue mottling danced in lines like veins under the ship's skin, bright but fading. The EMCs' nukes might not have made contact before they detonated, but the fireball should have been enough to kill anything. Or at least anything that Drummer knew of.

"It's firing missiles, ma'am," the sensor tech said.

They'd known. Laconia had known they'd be facing nuclear torpedoes. And now everyone on all the colony worlds would see that even that wasn't enough to kill their ships. Maybe that had been the point all along.

"Tactical," she said. "Get me tactical."

The display jittered and shifted. The orange dot was now deep in the cup they'd created to destroy it, and it was still not destroyed. Even with its tactical maneuvering, its course toward the inner planets hadn't shifted.

All around it, bright-green dots were blinking out.

Chapter Forty-Three: Naomi

The scratch came in the middle of the third shift. If Naomi had been able to sleep, it would have been her midnight, but she was in her bunk, staring into the darkness and waiting for something she knew wouldn't come. So she heard it—fingernails against the access door that led to the corridor. It was softer than a knock, but it meant the same thing. *I'm here. Let me in.*

She sat up. Her body ached like she'd worked out too hard, but it was just stress and fatigue. She pulled herself up, opened her door as Bobbie, across from her, opened her own. Bobbie was wearing a tight jumpsuit. The kind you'd put on under a vac suit. Or, she supposed, power armor. She nodded to Naomi, but didn't speak. They were both being quiet for the others—Amos and Alex and Clarissa. The ones who could sleep, maybe. Someone ought to.

Bobbie opened the door to the public corridor.

Katria wore the uniform of the Medina maintenance crew. Green with a station logo printed on the shoulders and back. A ceramic toolbox rested on the deck by her left foot. Gray where it wasn't scratched white by long use. Naomi guessed there was enough explosive in it to kill all of them so fast they wouldn't know they were dead until the funeral. Katria's nonchalance with it was like a boast. Voltaire Collective had always been like that, even back in ancient days when Earth and Mars had ruled the solar system and no one had ever heard of Protogen. Every revolution needed its mad bombers, apparently.

"Tag," Katria said to Naomi. Then to Bobbie, "You ready to play a game?"

Bobbie put her hand on Naomi's shoulder. "Take care of the kids until I get back."

"I will," Naomi said. "Good hunting."

"Thanks," Bobbie said. Katria stood aside and let the big woman pass. The emptiness on Bobbie's face could have read as indifference to someone

who didn't know her. To someone who didn't understand the kinship that Bobbie felt to Mars and its military, and to those who had served once and then been forced by conscience or circumstance to walk away.

"Bobbie," Naomi said. "I'm sorry."

Bobbie nodded. That was all. An acknowledgment that they both understood the situation, and would do what needed to be done. Katria plucked the toolbox up, and the two of them walked away down the corridor. Naomi closed the door behind them.

Back in her bunk and sleepless, she wondered what Jim would have done. Something idealistic and impulsive that would lead to more complications, probably. Certainly. And he would have done it in a way that kept that expression off Bobbie's face if he could. Even if it meant doing something terrible to himself. Like languishing in a Laconian brig. An image came to her mind of Jim being tortured, and she pushed it away. Again. Feeling fear and sorrow would come later, when they were done. When he was back. There'd be time for it then. She didn't manage actual sleep, but she was able to drift a little before the shift change. It was enough to let her feel rested, but not deeply.

She met Saba at the same public counter where they'd used the freezer, but this time they sat at the front like customers. The girl behind the counter turned up the music playing from her system speakers loud enough that they could barely hear each other, their words drowned in drums and strings and ululating voices. Saba looked as tired as she felt.

"Something happening back in Sol system," he said. "Looks like the big fight. Not sure how it's going to play."

Half a dozen possibilities flashed through her sleep-starved mind ranging from the miraculously good to the catastrophically bad. It didn't matter. Nothing that happened there changed what they were doing here. But Saba's wife was there, back in the empty spaces where they'd all lived, once upon a time. She knew too well what that fear felt like.

"You have the list?" she asked.

Saba nodded and pressed a silver memory chip into her hand. "All the ships we could make contact with," he said.

"How many?"

"Twenty-one."

Naomi nodded. Twenty-one ships docked on Medina and waiting for their chance to load up and fly. It was more than she'd hoped for. It was

also enough to pose some problems. “I don’t like having this many people knowing what’s going on.”

“It’s a risk,” Saba said, as if he were agreeing with something she’d said. “How does it make us for time?”

“If you don’t mind half of them vanishing in transit, we can go pretty fast,” Naomi said, more sharply than she’d intended. She shook her head, apologizing, but Saba ignored both the snappishness and the regret for it.

“Say we don’t. Everyone through the gates safe and sound. What does that look like?”

“I can’t know that until I look at the ship profiles. Mass, drive type, cargo. All of that’s going to make a difference.”

“Ballpark.”

“A hundred minutes. That’s conservative. I can probably find a way to make it less.”

The girl at the counter swung past, pouring fresh tea into their glasses. Tiny bits of mint leaf swirled in the reddish amber. Naomi took a sip while Saba scowled. “That’s a long time for the station’s eyes to stay blind. And a lot to lose if they find a way to put it back together.”

“Truth,” Naomi said.

Saba scratched his chin with the back of his hand. If they ever played poker together, it was a gesture she’d remember. His tell.

“Your technician. The one to break the system?”

“Clarissa.”

“Her, yeah. If she doesn’t do the thing and do it well, everyone on those ships is going to die from trusting me. Not disrespect, but it’s mine to say. Not sure she’s good for it.”

“Clarissa knows what she’s doing,” Naomi said. “She’s smart, she’s studied, and she knows this station. She broke it once already.”

“She’s as thin as wire,” Saba said. “I could blow her over from whistling.”

There was no humor in his face.

“I trust her with my life,” Naomi said. “No hesitation.”

“You’re asking me to trust her with more than that,” Saba said. “I don’t. Not that she doesn’t know, not that she’s unwilling or not to trust. But straight between us, sister. Putting all of us on one girl just this side of hospital? It’s not prudence.”

“I think you’re asking me for something.”

“You go with her,” Saba said. “Leave the prison work to me and mine. We’ll do that. You back up your crew.”

Naomi shook her head. “The prison’s mine,” she said. “Clarissa will do whatever needs doing. She’s got backup already. Jordao. Katria’s man. Unless you don’t trust him?”

“I don’t trust anyone,” Saba said. “Not him, not her, not you. But I work with what I have to work with, and I know you’re not going to run when things go harsh. Maybe Katria’s people will, maybe they won’t. You won’t. And ... the sensors are more important than the prisons. We lose the prisons, we only lose the prisoners, savvy sa?”

He was right, and she knew it. Putting the success or failure of the mission in the hands of a medically fragile woman—however competent she was—and then not giving her the backup to deal with an emergent problem was bad practice. But in her imagination, Naomi saw the letters on her list as clearly as if she’d been reading them afresh. *SAVE JIM*. She shook her head. “Prison’s mine. Sensor arrays are hers. Won’t be a problem.”

Saba sighed as the music shifted key and tempo. A man’s voice growling like a bearing going bad lamented his own failings in a mix of Hindi and Spanish that she could almost follow. She looked Saba in the eyes until he looked away. “Work up a schedule, then. All the ship data’s on there. But do it fast. We have to distribute it by hand before we pull the trigger.”

“Two hours,” Naomi said. “I’ll have it ready.”

An hour later, there was still no word from Bobbie. No way to check in. They waited in their bunks, the doors open on their little common hallway. Amos stood in the head, leaning against the sink with his arms crossed. Alex sat in the doorway of his cabin. Clarissa stretched out on the deck like a bored teenager waiting for the hours to pass until she could begin living. Her skin was unnaturally smooth and tight. It helped the illusion. Naomi sat on her bunk, hand terminal in her lap, and arranged the flight schedule while they talked.

“I don’t know,” Alex said. “I mean, sure, it’s a risk that there’ll be ships waiting on the other side of the gates. There have got to be some queuing

up to get to Medina when they don't think they'll get shot at. But if we're only looking at twenty-one ships?"

"I'm only lookin' at one," Amos said.

"So let's say there's two hundred ships waiting to come through," Clarissa said, ignoring him. "High end of plausible, but what the hell, right? That's eleven hundred gates with no one standing by close enough to get a really good look at whoever came through. That's still a fifteen percent chance of getting seen."

"That high?" Alex said. "You sure? I thought it'd be less than that."

Naomi went through the data Saba had given her. The *Old Buncome*, a recent-generation transport ship with a high-capacity Epstein drive and a cargo hold full of refined titanium. The *Lightbreaker*, a three-generation-old yacht salvaged by a semigovernmental courier service. The *Rosy Cross*, a rehabilitated prospecting ship with five previous owners and a drive that leaked enough radiation to cook with. The *Han Yu*, a privately owned coyote with authorization to carry settlers to the colony worlds.

Each ship had its own specs, its own limitations. And each one would have an effect on the ring gates that could make the ship leaving after it vanish into wherever ships went when they went dutchman. Naomi knew the curve as well as she knew her name, and the hand terminal—limited as it was—had enough native computing power to lay that in. Writing a program to weigh all the variables, evaluate each ship, and create a best-speed model wasn't hard, but it took time and focus. Neither of which she had in great supply.

"It ain't that high if you're only looking at one ship," Amos said. "You can bend the odds pretty good. I mean, no one's going for Sol gate unless they're tired of life. And there's not going to be any ships waiting to come through from Charon or Naraka."

"If we're down to hiding out in dead systems ..." Alex began.

Clarissa interrupted him. "We should go to Freehold."

"You feeling okay, Claire?" Alex asked. "You remember we didn't leave on good terms, right? It was even money for a while that they were going to shoot Bobbie and Holden before they could get back to the ship."

From where Naomi was sitting, she could see Clarissa's ankles shift around each other as she rolled onto her belly. "No, I'm serious. They're fiercely independent. They were willing to stand up to the Transport Union, and I don't see them rushing to wave the Laconian flag either. They're

underdeveloped enough that there won't be complex local politics. No factions within factions that we don't understand. Or at least fewer than you'd get somewhere like Gaon Complex. Plus which, we know there aren't any ships observing the other side of their ring, because we were the only ship in the system, and no one's gone out there since the occupation started."

"That Houston asshole *was* pretty smart," Amos said.

"Ah! I see what you're doing," Alex said. "You're trying to make flying out to Charon and dodging radiation flares sound like a good idea. It's that whole 'I'll put a shitty idea next to a *really* shitty idea so the first one looks shiny by comparison' thing."

"I think we should go to Freehold," Amos said. "Naomi? You think we should go to Freehold?"

"Sure," she said, starting the data run.

"Seriously?" Alex said.

"Her points are all solid," Naomi said. The data run stopped a third of the way through. She ended the process and opened the run logs. "We have to get small for a while. Be hard to see. Wait for Laconia to show us where its weak spots are. We'll have to be someplace while that happens. It might as well be there."

"But the shooting-us part?"

"Is something we'll need to work through," Naomi said. "Hey, those paper uniforms people can get out of the station kiosks? Do you think we could get that to print out sheets?"

"Like bedsheets?" Alex said.

"Something to write on so we can distribute this when I'm done. Can't put it on the system."

"Maybe," Amos said. "Be kind of weird, though."

The run log looked decent until it started the confirmation routine. Then it hung on something. She grabbed the code reference and went back to the original script.

The others were still talking, but her focus on the screen lowered the volume on them. She was aware of Amos' low, gravel-strewn voice. Clarissa, higher and more musical. Alex with the ghost of a Mariner Valley drawl that was more habit than accent. Her family. Part of her family.

There was a zero result where there should have been a berth number. That was where the code was choking. It probably made sense to just chuck

the routine entirely. Reaching beyond Saba's secret network—even if it was only for passive information like reading docking records—was a little risky. But building a schedule on unconfirmed data could screw them up as well.

She hesitated, pulled the code, then put it back and reopened the logs. The bad entry was the twelfth ship in the logs. The *Lightbreaker*. She tapped her fingers against her thigh. Dig deeper and risk being noticed by security or ignore the error and move ahead as if everything was as expected. If she'd gotten a little more sleep, it would have been easier to make the decision.

"Bárány o juh, son toda son hanged," she said to herself and opened a low-level request to the docking records. It only took seconds for confirmation to come through. The *Lightbreaker* wasn't in its berth. It had shipped out two days ago. The flight plan listed the destination as Laconia with a service code that looked military. Well, that was one less for the evacuation plan. It would make things faster, but Saba would need to know. The crew, if they weren't on the burn for the heart of the enemy, would need other bunks.

She looked at the service code. Touched it with a fingertip.

"Alex? Did the MCRN have a code eighteen twenty-SKS?"

"Sure," he said from the hall. "Did a few of those myself, way back when. Priority prisoner transfer. Why?"

When she'd been about eleven, Naomi had been working in a warehouse on Iapetus. A steel support beam had popped its welds and sprung out, clipping the back of her head. It hadn't been pain, not at first. Just a feeling of impact, and her senses receding a little. The agony had two, maybe three seconds to clear its throat and straighten its sleeves before it crashed over her. This felt very much the same.

Her hand trembled as she looked for a manifest. Something to say who'd been on the *Lightbreaker*. Who'd been important enough to the empire that they'd commandeered a ship just to take them away. There was nothing. Of course there wasn't. Why would the Laconians announce that to anyone? She checked the dates, the times. It didn't have to be Jim. It could have been someone else. But it wasn't. She took a moment for herself and the pain. Five seconds. She could let herself hurt for five seconds. Then she had to get back to work. The rest would be for later.

She sent a message—text only—to Saba. The missing ship, the service

coding, her suspicion that James Holden was already past the ring gate and into Laconian space. Did Saba have any contacts who could confirm that? After the message sent, she took a deep breath. Then another. She pulled the *Lightbreaker* out of her dataset and ran her code again. It didn't hang this time.

She got up, surprised by how steady she felt, and took the two steps to the door.

"What's the matter, boss?" Amos asked.

Naomi shook her head. When she spoke, she spoke to Clarissa.

"I had a talk with Saba. I'm going with you on the sensor-array leg of this."

Clarissa's brow was bent by whatever she saw in Naomi's face. "Okay. Why?"

"Risk management," Naomi said. "If the prison break fails, we don't get as many people out. If the sensors come back up and they're able to track which ships went through which gates, the whole mission fails. Better that we spend our resources where they matter the most."

"But if Holden is ..." Clarissa began, then went quiet. Naomi watched her understand. "The prisoner transfer."

Alex's face was grayish. And pale. "Fuck," he said.

"And we need something to write down the evacuation plan on," Naomi said. "Something small and portable, and not connected to the computer networks at all."

Amos pushed himself up from the sink. "You got it, boss. Give me twenty minutes."

"And something to write with," Naomi said as the big man walked out into the public corridor.

Her hand terminal chimed, and she went back to her crash couch. The run was finished. Twenty ships, in the order that would get them through the gates and gone at the min-max point of risk and speed. Optimal was eighty-seven minutes, even with the *Rocinante* looping back to pick up Amos, Bobbie, Clarissa, and her. It was a solid plan.

She had a solid plan.

She pulled up her organizational notes and sat for a moment, looking at the words she'd put there.

SAVE JIM.

She drew a line through them.

Chapter Forty-Four: Bobbie

Tag,” Katria said, then turned to look at her. A ghost of a smile touched the other woman’s lips, and Bobbie wondered just exactly how much of the violence of their first meeting was really forgotten and forgiven. “You ready to play a game?”

After half a beat, Naomi’s gaze tracked over to her. Exhaustion had yellowed her sclera, and her skin had an undertone of ash. She put a hand on Naomi’s shoulder to steady her as much as anything.

“Take care of the kids until I get back.”

“I will. Good hunting.”

The words were a little punch in the gut. *Hope you kill someone. Some other Marine who had the bad luck to be born on the wrong side of this. Who’s as loyal to his people as you are to yours. Whoever they are, I hope you get them before they get you.* The truth of it was, despite everything, there was a joy in this. She’d spent some of the most important years of her young life training for moments like this one, and as much as she wanted to have grown and matured, aged into a woman of peace, part of her still really liked it.

“Thanks,” Bobbie said, and stepped out.

“Bobbie ... I’m sorry.”

Bobbie nodded as Katria scooped up her toolbox. They walked together toward the intersection with a larger corridor. The door closed behind them with a soft click and the whir of the lock. Katria chuckled under her breath, but Bobbie didn’t ask why. She didn’t much want to know.

Most of the people in the corridor were walking, but there were a few carts loaded with containers. At one intersection, a man was driving a loading mech, moving it from one warehouse to another. It was a four-point harness. If she got in by his side, she could loop one arm around his neck and choke him out while she unbuckled him from the controls with the other. Drop him out, swing around, and strap herself in. It would probably

take thirty seconds. Maybe less. Easy peasy.

As they walked, she felt herself relaxing, sinking down into her hips as she walked. Lowering her center of gravity. She whistled a little, softly. Katria raised an eyebrow, but didn't comment. The screens along the walls announced that the security forces were closing in on the terrorist cell that had blown up the oxygen tanks, but Bobbie didn't see anyone giving the pair of them a second glance, much less closing in.

There was a sparseness about the halls. Even with the carts and the people, there was an emptiness showing through. Part of it had to be that, with no ships coming in or out of the station, there just wasn't as much to do as there would have been. But part of it was also fear. People staying in their holes. Staying out away from the checkpoints. Out of trouble.

They took the ramp down, away from the inner surface of the drum. There weren't many places on the drum that came close to the skin of the station. Most of the outer layers had been designed with radiation shielding in mind. Water tanks, storage for ceramic and metal and steriles. Service halls with anti-spalling covered in paint and conduit and pipes. But there were a few junctions near service airlocks where only a few layers of steel and ceramic and foam separated their feet from the outside. It reminded her of being on one of the old *Donnager*-class battleships. The bare functionality of the design belonged to a different generation from the residential levels or the inner face of the drum.

The hallway where Katria stopped looked just like the sections they'd been walking through, but she checked the section identifiers painted on the walls and the pipes, then stamped her foot on the deck like she was listening for something in the way it rang.

"Here?" Bobbie asked.

"This is the place. Boost me up."

Bobbie locked her fingers together into a cradle, and Katria put her foot into it. She didn't weigh much. Bobbie hauled her up toward the ceiling. Could have kept her there for hours, she thought. Katria caressed the ceiling with her palm, then found what she was looking for, pressed hard enough that Bobbie felt it, and slid a panel aside. A little gap, hardly more than a decimeter, between the panel and the structural beam above it. Katria hoisted her toolbox, checked its orientation, and slid it into place. She pulled the ceiling tile back and tapped Bobbie on the shoulder to be put down.

“That’s it?”

“No,” Katria said, and pulled a bit of black tape from her pocket. After a moment’s consideration, she curled it around a bit of pipe just beside the bomb, then took her hand terminal out and shifted to a screen Bobbie had never seen before. A rough, grainy image of the hallway appeared on it, including her and Katria from the tape’s perspective.

Katria stood directly under the bomb, then tapped her own image on the screen. Red script came up—LOCKED—and she put the terminal back in her pocket.

“Now, that’s it,” she said.

“Okay,” Bobbie said. “Let’s go outside.”

The maintenance airlock was uncrewed. Two vac suits hung in the lockers, a large gray transport box with its lid open and unsealed, and inside of that, a yellow ceramic box beside them with ZEMÎ TOR stenciled on it in black.

The transport box’s wheels were retracted, the steering handle stowed on its side. The walls and lid were only a little thicker than the real thing. Whatever they were using for shielding, it was thin. She hoped it was light too.

Bobbie put on the environment suit, checked her seals and air supply. She and Katria checked each other. The suit had a magnetic tether built into it, a ribbon as wide as her hand and thick as her pinky, dirty from years of use. The airlock itself was set into the floor. The little platform to carry them out to the drum’s surface, and hopefully not fling them out into the emptiness of the slow zone. With both of them and the box, it was a tight fit. Bobbie watched the suit’s sleeve puff out a little as the lock cycled out the air.

Katria pressed her helmet against Bobbie’s and shouted. With only physical conduction to carry the sound, her voice was distant and muffled. “Last chance to back away.”

Bobbie smiled and made an obscene gesture. She could see Katria laughing, but she couldn’t hear it. The lock cycled, and the platform descended.

The body of Medina’s drum curved away above her to the left and right, extended ahead of her and behind. She felt like she was hanging on to the belly of some massively vast whale. The gates were only pinpoints of eerie and erratic light, as regular as a printed pattern against the surreal darkness

below her. The gates and the tiny dot of the alien station in the center of ring space. It wasn't her first time outside a ship in the slow zone, but she shuddered all the same. Falling off a spin station in normal space meant drifting out at whatever velocity the station had given her until someone came to haul her back or she ran out of air. Losing her connection here meant falling into the blackness between the gates and vanishing into whatever existed—or failed to exist—on the other side. Normal, star-strewn space could feel like an infinite ocean, vast and glorious and uncaring. The slow zone felt like being in something's mouth.

Katria put her safety tether on the surface of the drum, then lay on her back and pushed her feet up until her mag boot locked to the station. Bobbie waited to follow until she'd taken a couple of awkward, swaying steps. And then she was also hanging upside down from the turning station. The crate in her hand wanted to fly up like the loop of her safety harness. Blood rushed into her head, filling her ears with their own distant roar as they walked—release, swing, push up, and reconnect to the station—back along until they found the stretch of plating that would become the breach point. Katria gestured to the crate—two fingers pointing, the Belter's gesture for *opening or deploying*. Bobbie nodded yes with a closed fist.

The mining net was a square of woven steel cable reinforced by carbon fiber. Rock hoppers and subsistence miners had been using things like it since humanity had first crawled up the well and started harvesting the near-Earth asteroids. The primary piton was thicker than Bobbie's thigh. She fastened it to the skin of the station, then waited for a moment as the external elevator shaft that ran along the drum from engineering to the command center passed overhead. She and Katria took different edges, pulling and stretching the net as they navigated around the target, placing the secondary pitons until the whole thing lay like a low, black blister on the side of the drum.

The trap set at last.

Katria dropped the box, and it flew up and away into the darkness, gone in an eyeblink. She led the way back almost to the airlock platform, then turned off one mag boot, and then the other, and swung on her safety harness, feet to the void. Bobbie did the same. It felt better to be right-side-up again, and worse to know that only one failure point was keeping her alive. Trade-offs. There were always trade-offs.

Katria slaved her hand terminal to the suit's arm display, copied the

output to Bobbie's, and set up a low-power radio connection between them. The corridor where they'd set the bomb appeared in the same grainy, muted colors as before. Empty for now, but not forever.

"Now we wait," Katria said through the radio. "The patrol puts their foot in our trap, or someone notices that we're out here."

"Yeah," Bobbie said.

"Don't worry. These Laconians are just like Earthers. They only think of ships and stations as inside. Comes from growing up in free air."

"The predictable limits of a conceptual framework," Bobbie said. A phrase from her classroom on Olympus Mons. "It's always where to hit the enemy. Whoever they turn out to be. When I learned how to do things like this, we were thinking about Earthers and pirates."

Katria laughed. "When I taught myself how to do this, I was thinking of people like you. Strange how the wheel turns."

The elevator passed above them again, the glowing orb of the alien station at the slow zone's heart appearing like a moon on her left, vanishing again on the right. Bobbie turned to look toward the docks. The *Rocinante* was down there somewhere. Her home and her ship. Or Holden's. Or neither of theirs.

Strange how the wheel turns.

The minutes stretched. Became hours. Twice, people passed through the corridor. A pair of electrical technicians. A sketchy-looking young woman pulling a child by the hand and looking over her shoulder as she walked. Bobbie wondered what the story was there, but it wasn't hers. Her anxiety slowly faded into a kind of dull anticipation, and then to both at the same time. The void passed beneath her feet again and again and again. She switched her air to the secondary bottle.

"Ah," Katria said. "Here we go."

On the monitor, two people walked down the hall toward the camera. Bobbie couldn't mistake the Laconian power armor for anything else. The patrol they'd been waiting for. The enemy approaching. Without a word, she swung back, set her feet against the station, and reengaged her mag boots. The spin gravity would try to straighten her legs, but that was exactly the wrong thing. She bent double, put her hands behind her knees, and held herself there. Katria did the same. Bat-brace position. It was hard to relax like that, especially knowing what was coming. She took a deep breath starting in her belly and moving through her whole chest, then let it out.

Shook her shoulders to get out the tension. Smooth and loose. That was the way to be.

She remembered the young Marine she'd flirted with when the Laconians had first taken the station. She wondered if he was on one of the patrols walking above her now, the soles of his feet unknowingly against her own. *Your turn now, my turn later*, she thought. The seconds stretched. The temptation to shift her arms so she could look at the screen was almost irresistible.

The station hit the bottoms of her feet like a hammer. Her legs slammed into her chest, blowing the air out of her. One mag boot threw an error, but only for a second. Then it was done. She turned, walking fast toward the net. It wasn't a low blister anymore. It was a hemisphere of debris and cables. Bent plating, shredded foam, and at the heart of it, trapped like two fish hauled out of a tank, human figures. Above her, the debris small enough to escape the net seemed to fly away from her, though it was really her spinning away from it.

"Hurry," Katria said. "They'll already be on their way."

"I know," Bobbie said.

At the net, they undid one of the pitons, opening it like the mouth of a tent. The gaping hole that led up into the station leaked water and coolant out, flying down past them as they hung. The nearer of the two bodies had taken the worst of the explosion. A crack along the collar and chest assembly. The inside of the helmet was a soup of blood. Bobbie wrestled the corpse closer, holding the arms and waist in a rescue hold while Katria fastened grips to the Laconian suit.

"Hold still," Katria said. The low-power radio made her voice seem farther away than she was.

"I'm doing my best," Bobbie said through clenched teeth.

"All right. He's solid."

"You're sure?"

"Positive," Katria said, and disengaged the primary piton. The net pulled free and fell away below them into nothing. Bobbie turned, forcing herself back to the airlock. Her muscles were burning from the effort. Twenty years ago, they wouldn't have been. The spin of the station made it feel like the dead Marine was pulling her down toward the depths, or else up into the emptiest sky in the universe. The power-armor helmet knocked against the back of hers. The dead arms and legs hung loose. Blood leaked from the

crack in the chest plate.

“I hope this suit’s not too fucked up,” Bobbie said.

“Hope later,” Katria said. “Walk now.”

At the platform, Bobbie shifted her weight and the dead Marine’s with a cry of effort loud enough that Katria turned off her radio. She hung from her safety tether and motioned Bobbie up. There wasn’t room on the platform for all three of them. Bobbie didn’t even nod, just turned the controls, and the platform rose. While the air cycled in, she sat across from the armor. Her heart was pounding. Her muscles ached. She’d just killed two of the enemy. There would always be a little something—that tug on her humanity that came from doing violence. There was a satisfaction too. It didn’t mean she was a good woman or a bad one. It meant she was a Marine.

Somewhere in the station right now, security forces and maintenance techs were scrambling to figure out whether the hole in the station or the possibility of rushing into more bombs was the greater threat. By the time they came to a decision, she needed to be as far away from here as possible.

The inner airlock door cycled open, and she hauled the corpse up into the locker room before she cycled the airlock again for Katria to use. When she popped her helmet seals, the dead man stank of blood and overheated metal and the same kind of lubricant she used on Betsy’s joints.

She pulled the body into the large gray transport box, closed the lid, and triggered the seals. Whatever alerts, whatever alarms the power armor had been sending out were blocked now. Or if Saba was wrong, she and Katria would find out soon enough.

The airlock cycled open while Bobbie was pulling off her environment suit. Her jumpsuit was drenched in sweat. Katria undid the seals of her own helmet and slung it into the locker.

“You get the package to Saba,” Katria said.

“I know the plan. I’m on it,” Bobbie said. “And thank you. I know we didn’t get off on the right foot, your crew and mine.”

“No need for that,” Katria said, popping the seals on her suit with the speed of long habit. “Just get the work done.”

“Copy that.”

“You know, this is the second time we’ve played the same trick. Use the blast to hide what we really meant? The data center. Now the missing power armor they’ll all think is out there in the black?”

“If they think we have it, they’ll change the shut-down code before we can reverse engineer it.”

“I know why,” Katria said. “I’m saying don’t count on doing it again. Patterns get people like you and me killed. This strategy’s played out. If Saba thinks otherwise, he’s a fool.”

Bobbie popped the wheels on the transport cart out, extended the handle. It rolled easily. She wasn’t looking forward to pushing the damned thing through the public areas of the station to Saba’s rendezvous, but she also wanted to get out of here as quickly as she could. She forced herself to take one long, slow look at it before she opened the doors, though. In case there was blood on it.

“There won’t be a third time,” she said.

“You sure of that?” Katria asked.

“Positive,” Bobbie said. “You get your people, and you tell them to be ready. Cracking the code on this suit is the trigger. Two minutes after that happens, we’re all getting the hell off this station.”

Chapter Forty-Five: Drummer

Bright-green dots were blinking out. Not all at once, but enough to notice. A wave of darkness moving through the cloud of attacking ships. Drummer checked the timestamp, but there was no gap. Whatever the *Tempest* had done at Pallas, it still hadn't repeated here. So what the hell was going on?

"Is it the *Tempest*? Is it firing?"

"Yes, ma'am," the sensors tech said. "The missiles are coming from the *Tempest*. Yes."

"How fucking many of them?"

The cloud of green, the orange dot, and now a new form. Red threads blooming out from the enemy, thick and ropery as a capillary map. The ship itself was lost in them. They reached out toward the EMC vessels. The union fighters. The void cities.

"That isn't possible. That's wrong," Drummer said.

The *Tempest* hadn't resupplied since it had come through the ring gate. It had been in a major engagement already. There was no way for what she was looking at to be real.

"The data is confirmed," the sensor tech said. "Guard of Passage is reporting the same thing."

"Get me Cameron Tur," she said. "Or Lafflin." Anyone who might be able to make the incomprehensible make sense.

"Should I continue to fire?" the weapons tech asked.

"Are we still in a fucking fight? Then yes, you should keep firing."

Vaughn made a small, disapproving sound in his throat, but she was far past caring about the delicacy of his sensibilities. The red threads swam through the void. They only seemed slow on the display because the distances were so vast ...

Here and there a thread died, a PDC round or a missile destroying the *Tempest's* attack. But there were so many, and when even one slipped past the guard, another green dot blinked out. The green dots shifted, swirling in

the display as the ships did in the darkness. A few dove toward the *Tempest*, moving almost at the same speed as the torpedoes. As gentle as it looked on the display, it was a killing burn. A suicide run for the crews of every ship that did it. More followed suit until dozens of ships were driving down toward the enemy.

It was a tactic of unspeakable bravery and desperation. Drummer didn't notice that her hands were in fists until the ache caught her attention. She made her fingers open, looked at the little flaps of skin she'd carved off with her nails.

The suicide attack reached its peak. It reminded her of pictures she'd seen of cloudbursts over the deserts of Earth. Huge, angry clouds with numberless tentacles of gray falling from them. A torrent of water racing toward a parched landscape, and evaporating again before a drop could darken the soil.

On the visual display, the bright, dancing veins on the *Tempest* were fading, and now that she knew to look, Drummer could see tiny openings along the sides of the ship opening and closing like pores. The lights of the missiles' drive plumes were like blue fireflies.

"How can they *do* that?" she whispered past the tightness in her throat.

"I have Cameron Tur," the communications tech said.

The camera made his face even longer than it seemed in person. The light shone in his eyes.

"Where the fuck are you?" Drummer snapped. "Are you seeing this?"

There was almost no lag before he answered. He was close, then. One of the escape ships. "I don't understand. The number of missiles they've fired ... that they're *firing*. These can't be normal devices."

On the display, the last three suicide attackers blinked out. If the *Tempest* moved to avoid the debris fields, it wasn't enough to register at this scale. It looked as though the enemy wasn't even bothering to evade anymore.

"The first battle, we wanted to learn from them," Tur said, talking fast and not looking directly at the camera. "I mean, we wanted to win. Of course we wanted to win, but we didn't expect to. The data—*how* we lost—was as important as stopping them."

"Tur?"

"Maybe they were learning from us too. Maybe they recalibrated something about the regrowth of the ship. Or the missiles."

"They survived a direct nuclear strike," Drummer said. "Are you telling

me that's something they can just *do*?"

"Apparently?" Tur said. He licked his lips anxiously. "We knew from the moment they stripped the rail guns off the ring station that they are capable of focusing and directing incredible sources of power. Things we've only ever seen on celestial levels. Collapsing stars."

"Collapsing stars? We're fighting a supernova in the shape of a ship? Why the hell didn't you see this coming?" She was shouting. Her throat hurt with it.

Tur blinked and his jaw shifted forward. He would have looked like a man spoiling for a fight if it hadn't been for the tears on his cheeks. She didn't think those tears had anything to do with her raising her voice. "Ma'am, that ship stripped Pallas Station down to something less than atoms. It shut down *consciousness* throughout the system in a way that I don't have the structural language to explain, and it seems pretty fucking unimpressed by the idea of locality. It's affecting the nature of vacuum through the whole solar system. If you didn't know we were punching above our weight here, I'm not sure what I could have said to clarify that."

"There is a way to beat them," Drummer said, "and we are running out of time. Find me how to win this, and do it now."

She cut the connection before he had the chance to reply. Silence filled the control room. No one was looking straight at her, but she felt their attention like a weight. All the time she'd spent resisting the pressure to make the Transport Union into a police force—into a military—and here she was anyway.

"Mister Vaughn?"

"Yes, ma'am?"

"Find me whoever is in command of the EMC wing of the fleet. I need them now." *Whoever's still alive*, she thought, but didn't say.

"Yes, ma'am."

The weapons tech's voice shook. "Should we—"

"*Keep firing*," Drummer said.

Drummer felt a heat in her chest. A rage and a certainty. This was the moment that tested everything she'd meant to be. This was what it was to be a leader in a time of crisis. She felt the power of it, the raw will to succeed. To devastate and end the people who would destroy her and the systems she embodied. She rose to her feet, her hands behind her, and she knew that everyone in the control room who looked at her would see

nothing beyond her superhuman resolve. Not even Vaughn.

And she knew it for the hollow mask that it was. How fragile.

“Guard of Passage is reporting a missile strike that got past their PDCs,” Vaughn said. “They’re requesting permission to withdraw.”

“We can’t run away,” Drummer said. “If we break now—”

People’s Home shuddered. A sound like the wail of a demon rattled up from the deck, bellied out from the bulkheads, rained from the ceiling. She waited for the wide, low hiss of escaping atmosphere. The fading of screams as the air became too thin to carry them. Instead, Klaxons blared.

She held her voice as steady as she could. “Report?”

“We’re hit,” the sensors tech said. “Something hit us.”

“Do we know what?” Drummer said.

“Rail gun,” Vaughn said. “Appears to have impacted section twelve, just spinward of the medical facilities.”

“How bad’s the damage?”

“I’ll let you know as I have reliable information,” he said. “Still trying to identify the chain of command with the EMC.”

Which meant they were in disorder. She wondered whether the band of suicide ships had been led by some admiral bent on making their last stand count for something. People’s Home bucked again, then twice more.

“Engineering’s been hit,” Vaughn said. “The reactor’s ... I can’t tell. Something’s wrong with the reactor.”

If the magnetic bottle failed, it would be like a low-yield nuke going off. Even if it didn’t crack the city open like an egg, the systems that kept them all alive would be melted and fused. And the prospect of aid ships reaching them in the chaos of the battle were low enough to pass for never.

“Drop core,” Drummer said.

Vaughn didn’t reply, but the thrust gravity stopped. Drummer grabbed the edge of her crash couch and dragged herself back into it, strapping down with the ease of a lifetime’s habit. The automated emergency report showed long swaths of the city under lockdown, pressure doors isolating levels and halls. Keeping the air in the city as best they could. If she hadn’t sent away as many nonessential personnel as the ships would hold, it would have been worse. As it was, it still meant deaths. People who’d trusted the union elections to put someone in charge who would protect them. How many of them were dead now who’d been alive an hour ago? And how many more seconds before the next round came? It was like someone else’s

thought dropped into her own brain.

A sickly calm washed over her. This was what it felt like to see death. To know that the worst was coming, and there was nothing she could do to turn it aside.

“Keep firing,” she said. *If we’re going down, let’s go down swinging.*

The weapons tech coughed out something between laughter and despair. “We are dry on rail-gun rounds. We are at six conventional plasma torpedoes, and five percent on PDC.”

Fire anyway, Drummer thought. *Throw everything at them.* Except that if the *Tempest* threw a missile at them, there would be no defense. Drummer closed her eyes. The temptation was still there. If it meant that she died—that all the men and women under her command died with her—at least it would be over. She wouldn’t wake up in a wave of dread. She wouldn’t watch the structures she’d sworn to protect be peeled away by a threat she hadn’t considered worth thinking about until the *Tempest* had flown through Laconia gate.

Come on. There has to be a way. Think of it. Find it.

“Should I maintain fire?” the weapons tech asked.

Drummer didn’t open her eyes. The moment stretched. “No,” she said. “Shift to defensive fire only. We can’t shoot down rail-gun rounds, but we can hold their missiles off.”

“Yes, ma’am,” the weapons tech said. She could hear the relief in his voice. She wondered if he would have thrown away the last scrap of protection on her order. And she wondered whether she’d have done it, in his position. Maybe.

“I have a connection to Colonel Massey,” Vaughn said.

“Who?”

“Commander Fernand Massey. Of the *Arcadia Rose*, ma’am. He’s in command of the EMC ships.”

“I’ve never heard his name before,” Drummer said.

“No, ma’am,” Vaughn said. All the admirals were dead. All the people she might have known. As ruined as People’s Home was, the fleet was in tatters. Her tactical display listed the ships disabled or dead. There were so many. A quarter of the combined fleet incapacitated or destroyed. They’d thrown everything at the *Tempest*. A wall of tungsten and explosives. And the enemy was still under thrust. Still firing.

It had all been a show. She’d known that. The *Tempest*’s intentionally

predictable approach to Earth and Mars. Letting the EMC and union prepare themselves. She'd thought it was just a way to erode their morale, but it was more than that. She saw it now. They'd known that they would win, so they'd invited the enemy to make the strongest showing it could. That way, when victory came, it would be unequivocal.

"Ma'am," Vaughn said.

"Yes, fuck it. Fine. I'll talk to him."

"No, ma'am. There's a new message for you. A tightbeam from the *Tempest*. It's listed as 'command to command.'"

Something twisted in her gut. Part despair and part relief. If they were sending messages, maybe they weren't sending nukes. At least not until she'd had the chance to hear what they had to say.

She undid her restraints and launched herself to a wall handhold. Her crash couch hissed and spun on its gimbals. "Route to my office, please," she said, as if it were a normal message on a normal day and not the dividing line between living under a conquering boot and dying before the end of shift.

Anxious curiosity shone in every expression—even Vaughn's—as she passed. She could have played the message there, in front of all of them. Maybe she should have. Nothing in it would be secret for long anyway. But she didn't want anyone watching her when she saw it. Except Saba, and she wanted him there badly.

In her office, she closed the door, then locked it. The little fern in the corner held its fronds high in the null g. A few things she hadn't stowed—a drinking bulb, a printout on plastic flimsy, a clump of potting soil—floated in the air. She'd spent too long in spin gravity. She'd come to assume it would always be there, a few years' habit enough to erase generations of experience and Belter identity.

She was aware that her brain wasn't functioning normally. She felt more like she was piloting her body than living it. She knew it was shock and trauma, but knowing it changed nothing.

She strapped herself into her chair, took control of her personal interface, and opened her pending messages. Three were listed as unread. One was from the commander of one of the refugee ships, one from a captain of one of the EMC ships, and the last was listed as Admiral Anton Trejo of the Laconian Imperial Navy. Somewhere in a different universe, the Klaxons stopped their wailing. She wished now that she'd brought

Vaughn at least. And maybe a whiskey.

She started the message playback.

Trejo sat at his station, his uniform immaculate and pressed. His thinning black hair was in place and his eyes a bright green. He didn't even have the good taste to look disheveled. His smile radiated warmth and sympathy. She half expected him to start talking to her about his relationship to God or a business opportunity she should keep quiet about for fear of starting a rush.

"President Drummer, I hope." He drawled like someone from the Mariner Valley. "If not, then please accept my condolences for her passing. I am Admiral Trejo of the Laconian battleship *Heart of the Tempest*, but you knew that. I'm reaching out to you now because I don't want to be misunderstood. Despite all the hostilities the Transport Union and the Earth-Mars Coalition have greeted me with, we're not enemies. Not you and me. Not the union and the empire. Not Sol system and Laconia. The high consul knew that there would be resistance to this change. We all did, and we respect that you had to do the things you've done.

"When people like you and I enter into a new phase of history, there's ... I don't know what you'd call it. Birth pangs? There's a time when you have to expect violence, even though you don't celebrate it. When the high consul first explained to me the parameters of this mission, I wasn't pleased. One ship, no backup, against an entire system? But he brought me around. And this moment, this message, is part of why I felt that his approach was the only moral way forward.

"I have tried to reach Secretary-General Li, but he isn't returning my messages yet. You're here, and you are at least equal in dignity to anyone on the inner planets. You can end this. I understand that you had to fight. You had to try to destroy me. I don't blame you for this. But I am permitted at this point to accept your surrender. Do this, and the inner planets will follow you. You will be treated fairly by the new administration. I promise you that.

"If you are not yet willing to accept defeat, then I would ask you, out of what I hope is mutual respect, to tell me one thing. What is the number of dead that you need in order to show history that your choice to end this was wisdom? That carrying on the fight would not have been bravery but foolishness. A hundred more. A thousand more. A million. A billion. Only say how many more corpses will make this possible for you, and I will

provide them.” He spread his hands. “Tell me the number. I await your reply.”

The message ended. Drummer floated against her restraints and thought about whether to play the message again, if only to give herself a few more moments before she went back to the command center. She could feel her pulse in her throat and in her wrists—a throbbing exhaustion. Released herself, pushed toward the door, down the short hall.

They were all silent when she arrived. She looked at her crash couch, there before the display. The moth-eaten wave of green. The tiny, indomitable dot of orange.

“Vaughn, I’ll need you to send a message to the *Heart of the Tempest*.”

“Ma’am,” Vaughn said, nodding crisply. *I could order him to his death. I could tell them all to fight to the last breath.*

“The message is this: ‘The number is zero.’ Send that, and then order all union ships to stand down.”

She looked for some reaction in Vaughn’s face. Rage or relief or disappointment. It was like expecting emotions from a stone.

“Yes, ma’am,” he said. “Is there anything else?”

“No,” she said.

There is nothing else. No way forward. Her fight was over. If there was any hope to stand against this empire, it was someplace else now.

If.

Chapter Forty-Six: Singh

He didn't see the catastrophe coming. Even when the scope of it became clear, he struggled to understand it. Blindsided.

The talk in the station—the talk everywhere—was about Sol system and the surrender. Singh watched it play out in newsfeeds and discussion forums, taking the role of official censor more for the joy of being present in the unfolding of history than from any immediate need. The combined fleet of the Transport Union and the EMC beaten and standing down. The newsfeeds from the local sources in Sol system were anguish and despair, with only a few outlets calling unconvincingly for the battle to continue.

For their own side, Carrie Fisk and the Laconian Congress of Worlds proved to be an apt tool for the job, praising the Transport Union's capitulation as a moment of liberation for the former colony worlds. *The rules and restrictions on trade are no longer being dictated by the generational politics of Sol. By being outside the system of favoritism, nepotism, political horse-trading and compromise, Laconia is positioned to bring exactly the reforms that humanity needs.* He noticed that she shied away from mentioning High Consul Duarte's name. It was always just *Laconia*.

Which was fine. The two were essentially the same.

But it was the conversation beyond her and other specifically recruited allies that made him feel best. Governor Kwan from Bara Gaon Complex issued a statement of support for the new administration so quickly that Singh was almost certain it had been recorded in advance. Auberon's local parliament also sent a public message to put themselves in place as early supporters of the new regime. New Spain, New Roma, Nyingchi Xin, Félicité, Paradíso, Pátria, Asylum, Chrysanthemum, Ríocht. Major colonies, some with populations already in the millions, had seen the battle at Leuctra Point and drawn the only sane conclusion. The power center of the human race had shifted, and the wise were shifting with it.

The imminent arrival of the *Typhoon* also helped. He had known Rear Admiral Song since he'd entered the service. Not that they'd ever been close, but she was a face and a name that carried a weight of familiarity. He'd only traded a handful of messages with her, mostly to arrange the piece for the newsfeeds, but speaking to her had reminded him powerfully of home. The routines he'd had on Laconia, the taste of the tea, the little park where he would sit with Elsa when she was newborn and Natalia was sleeping. Watching sunbirds dive into the pond. Sending James Holden back had begun it, and the coming of the *Typhoon* would complete it. Traffic to and from Laconia. Proof that the great roads of space were open.

The longing it called forth in him was vast and complex. The open sky that he wouldn't see as long as he remained governor of Medina. The touch of his wife's skin against his, which he could look forward to. His daughter's laughter and the soft sounds she made at the edge of sleep.

There was a way in which every day since he'd stepped off the *Storm* had been a pause, like holding his breath. And soon, soon, his real work could begin. With the *Typhoon* in place and Sol system conquered, the empire would be unassailable, and humanity's future assured. He'd ignored his own anxiety and impatience, and now that he could almost relax, he felt them straining for that release.

Taken together, all the good news nearly made up for the bad.

"By comparison, the attack was minor," Overstreet said, walking beside him as they went to the executive commissary. "We lost two Marines, but the infrastructure damage was trivial compared with the previous attack."

Singh wasn't sure whether they had come off the patterned time for the executive staff or if word had spread before him and cleared the commissary, but only four people were seated at tables enough for fifty. The door attendant ushered them to a small table set apart from the rest, where they wouldn't be casually overheard. He and Overstreet made their requests—green tea for Singh, a local drink called black castle for Overstreet—before they went on with their conversation.

"We have them on the run," Singh said. "Smaller attacks, targets of convenience instead of strategic ones? This underground is running out of steam."

"That is certainly possible, sir," Overstreet agreed. "Still, I'll feel better when we have them all in custody."

It probably wasn't another dig at his decision to send away Holden, but

Singh felt a little sting all the same. The drinks arrived with a small plate of pastries. Overstreet held back until Singh had taken one. A small point, but one that Singh appreciated.

“What is the status of our friend’s operation?” he asked.

Overstreet leaned forward, folding his hands around the cup of black castle. His mouth narrowed. “We should know in about half an hour now. If your informant is what he claims to be, he and his co-conspirators will be walking into the power-routing station. I have five officers and five Marines waiting for them.”

“Do you expect a fight?”

“I’m hoping for one,” Overstreet said. “There’s nothing the troops would like better than an excuse to break a couple heads.”

“I need those brains intact.”

“Fingers, then,” Overstreet said with a chuckle. “No one loves a mad bomber.”

“Fair enough. The informant, though. He goes free.”

Overstreet nodded, but he looked like he’d tasted something bitter. Singh leaned in a degree and let the silence ask the question for him. Overstreet met his eyes, looked away, and shrugged.

“I’m not sure that’s a good idea, sir. If we take the others and he slips away, his people will know he’s working for us. They could turn him back.”

Singh felt a stab of annoyance, but he pushed it down. He had to remember what he’d learned with Tanaka. Better that he be patient.

“You think he may be a triple agent?”

“It wouldn’t be the first time something like that had happened. The one thing you know about someone who’s willing to compromise his allies is that he’s willing to compromise his allies.”

“What do you suggest?”

“Question him, the same as the others,” Overstreet said. “When his trial comes up, put a word in the judge’s ear.”

Singh sipped his tea. It was still a little too hot. It scalded. “I’m not certain that helps us build a network of locals who will work with us.”

“If I do my job right, we’ll be able to put a replacement in his spot. And a little clemency come sentencing time is more than he deserves.”

It felt like a betrayal. The man, compromised though he was, had done his part. He’d brought the information to prevent the sabotage of Medina’s sensors to Singh. Handing him over for trial didn’t seem like a just reward

for loyalty. But Overstreet had a point. Jordao was a member of a conspiracy against the station and Laconia. He likely had blood on his hands, and there was a greater loyalty that a governor owed to his own people than anything a local thug could command.

“Fair enough,” Singh said. “A normal interrogation. But tell your people just that. If they need to take their frustrations out on someone, make it the ones who weren’t working with us.”

“I can do that,” Overstreet agreed. And a moment later, “It’ll be good having this wrapped up before the *Typhoon* gets here. I was hoping this wouldn’t drag on.”

“To a degree,” Singh said, “it’s to be expected. Periods of transition invite a certain—”

Overstreet started. He put his black castle down fast enough that it sloshed onto the table, then he checked the monitor on his wrist. The red of a priority alert glowed there like a little flame. He tapped it with a scowl. His eyes went dead. Singh’s breath went shallow.

Something had happened. Another terrorist attack.

“What is it?” Singh asked.

“We have an unauthorized launch,” Overstreet said, standing up. Singh stood with him, drinks and baked goods forgotten. Adrenaline surged through him. A ship—even a small one—crashing into Medina could do terrible damage. Could crack the drum, destroy the station. Overstreet was already walking for the security station, fast, scissoring steps that weren’t quite running and weren’t quite anything else. Singh had to trot to catch up.

“What ship?” Singh asked.

“Old Martian gunship,” Overstreet said. “Name’s the *Rocinante*.”

“James *Holden*’s ship?” What did that mean? Was his crew making some kind of doomed bid to catch the *Lightbreaker* and bring him back? Or take revenge for his loss?

“It has capacity for twenty missiles and a keel-mounted rail gun. Not to mention a fusion drive that could melt the station to slag if it chose to,” Overstreet said, “but it hasn’t opened fire. It’s staying close to the station with maneuvering thrusters.”

“Can we take them out?”

“We destroyed Medina’s defenses when we took it,” Overstreet said. “We have a few that were repairable, but without the supplies from the *Typhoon*, our abilities are limited.”

“The *Storm*, then,” Singh said.

Overstreet took a deep breath, turning smartly at the intersection. Surprise and anxiety made the security office seem kilometers away. “I don’t like the idea of having a close-quarters battle between those ships right near the station. If the *Rocinante* is just trying to escape, there’s an argument for letting it go.”

“We can’t rely on the enemy’s goodwill to protect us,” Singh said, and opened a priority connection to the *Storm*. Commander Davenport, his executive officer on the journey out, answered like he’d been waiting.

“Davenport, this is Governor Singh. I am formally instructing you to leave dock immediately and protect the station from the gunship *Rocinante*.”

“Yes, sir,” Davenport said, then hesitated. “We are presently at less than full crew, sir—”

“A little short-staffed now is better than a full ship too late. Try to chase them away from the station before you engage.”

“Yes, sir,” he said, and he dropped the connection.

Ahead of them, security was clearing the corridor. An emergency alert sounded and a gentle voice began. *This is an emergency alert. Report to shelters immediately and await official instructions. This is an emergency alert.*

The security center was buzzing like a kicked hive. Voices raised in alarm thickened the air. The feeds from drones and surveillance cameras filled every screen. Singh assumed it was all in response to the *Rocinante*’s launch until an older woman in security uniform barked at them. “Major Overstreet, sir! We have reports of a riot in the detention cells.”

“What?” Singh said.

Overstreet’s voice was level and calm. Like a pilot whose ship was coming to pieces around him. “What do we know?”

“Someone overrode the containment on the cells. There was some kind of explosion. The guards have retreated to the security lock, but I’m getting reports of gunfire from the civilian side too. I have two fire teams on their way.”

“Good,” Overstreet said. He turned to Singh. “Sir, it is my opinion that the sabotage effort your friend discovered is part of a much larger operation, and whatever the enemy has in mind, it’s happening right now.”

Singh shook his head, not as disagreement, but like a drunk man trying

to clear away the fog. Some part of him was still thinking that because they had the guard force ready to keep the station sensor arrays up, things were under control. That he was prepared for whatever was happening, even as it bloomed out around him.

“I understand,” he said.

“As your chief of security, I recommend that we get you and any other essential personnel in lockdown until the situation is better controlled.”

“Of course. I’ll return to my office.”

“Might not want to stay that near an obvious target, sir. I have a secure position prepared. I’ll have a fire team escort you and stay there until we understand better what we’re looking at,” Overstreet said. He turned to the older woman and gestured toward Singh. “He needs an escort.”

“On their way, sir.”

Belay that, Singh thought. *I’ll stay here*. Except that it was a stupid impulse, based in pride. A leader should stand with his team in a time of crisis, but—as much as it galled him—Overstreet was that leader in this moment. He would only get in the way. And even so, part of him wanted to remain. To be *seen* to be in control.

“I will expect updates,” Singh said. “When you need my authorization, I will be waiting.”

“Thank you, sir,” Overstreet said without missing a beat, then turned away. A moment later, four Marines in power armor stepped in through the main door and saluted.

“Governor Singh, sir.”

“You’re my escort, then?” Singh said with a smile that he hoped looked confident. “Let’s be on our way.”

As they walked, Singh consulted his own wrist monitor. There was too much happening—too many individual groups coordinating on the fly—to have a complete picture of the situation. The *Storm* was maneuvering, and the *Rocinante* hadn’t yet made an aggressive move. The riot at the detention cells was growing more violent, and the Marine fire team was requesting permission to escalate to lethal countermeasures. And Overstreet’s words came back, haunting with their implications: *My best estimate is that a third of our operating personnel are open to working against us*.

The hardest thing was to trust his own people to do their jobs well, but it was what he had to do. He wondered if the high consul suffered the same thing—knowing that all the critical action would be taken by others who

were guided by his orders, but in conditions he could only guess at, and in places where his intervention, even if it were possible, could only muddy the waters. It was a subtle and terrible insight. The powerlessness of control.

The warning echoed through the station. A man ran through an intersection ahead of them without pausing to look. Singh's legs burned a little from his pace.

"Where are we going?" he asked the head of the fire team.

"We have a hard shelter at the end of this corridor, sir. It's a bit away from the main offices to be a less obvious target, but it has independent environmental controls and—"

The Marine froze in midstride. Singh felt a rush of fear, looked down the corridor to see what danger the man was reacting to. There was nothing.

"What's the matter?" he said. It was only when he got no answer that he realized all the Marines had stopped. Their visors were opaque, their radios silent, their power armor in lockdown. Singh stood, suddenly alone and terribly aware of his own vulnerability. The back of his head itched at the idea that someone might be targeting him right then, and he had no protection.

For a moment, he saw Kasik again, dying before him. Was all of this a distraction to pull him away from safety? Hands trembling, he strode fast down the corridor to the first door. A public restroom. He stepped in, made certain he was alone, and locked the door behind him. His heart was beating hard enough to feel the ticking of it in his neck. Leaning against a narrow sink, he pulled his monitor and keyed in his security codes. His Marine lockdown hadn't been triggered. The Marines shouldn't have been disabled. Someone was putting out a false shutdown signal.

Overstreet answered his connection request at once.

"My fire team is disabled," he said.

"Yes, sir. I'm seeing the same with all the powered teams. Stay where you are. I am sending a conventional escort to your location."

"What the hell is going on out there? I need a report!"

Annoyance flickered across Overstreet's face, gone almost before Singh could register it. "The loss of functioning fire teams has let the situation at the detention cells deteriorate. I have initial reports that something's happening at the dockmaster's office. I'm waiting for better intelligence on that, but I am seeing what looks like several ships getting ready for launch.

The *Storm* has engaged with the *Rocinante*, but not conclusively as yet.”

Now, may I please go do my job instead of talking about it? He didn’t say it, but Singh heard it anyway.

“I will wait for the second escort,” Singh said. “Carry on.”

He dropped the connection. In the mirror, he looked small. Frightened. He stood, straightened his uniform, and composed himself until his reflection looked more like a man confident in his control of the situation. It was important when his people came that he give the right impression. That was all he could do now.

Something thumped deep below him. A strike on the station drum, maybe. A sign of the battle going on all around him while he hid in a public toilet.

The underground had caught him unprepared. To give them their due, he’d underestimated their coordination and their numbers and their will. He had been told that the Belters of the old regime had a culture of violent resistance. After the sabotage of the oxygen tank, he had thought he understood what that meant, but he hadn’t appreciated the depth of it until now.

Their plan was unfolding right now all around the station. All he could hope was that the one place he knew that he was ahead of them would prove decisive. If disabling the sensor arrays was critical to their plan, he could still bring all the rest of it crashing down.

Chapter Forty-Seven: Bobbie

Bobbie's harness consisted of three magnetic locks about the size of her palm and two bands of woven nylon that looked like they'd been green sometime in their past. Basic safety equipment, standard on any ship, any dock, any station outside a gravity well. Wondering whether they worked was like wondering if her next footstep would sink through the atoms of the deck.

"You think these things are going to hold?" she asked. Her radio was set to a broadcast strength so low a thick T-shirt would have jammed her. Amos, beside her, looked up the long curve of the *Gathering Storm's* exterior. His helmet hid his expression, but his tone was fatalistic.

"If it doesn't, this'll be a weird day."

The surface of the ship wasn't like anything Bobbie had ever seen. Faceted like a gem, without the protrusions of PDC cannons or sensor arrays. The pinks and blues seemed less like the color of the material itself and more like some kind of refraction. Something that it did to light that was much weirder than selective absorption. The darkness of the slow zone was profound. Her helmet had to enhance everything with what it picked up from the glow of the ring station. It even stretched the edges, pulling ultraviolet and infrared into the visible range, just to have more to work with. It was always like this, but waiting—exposed and uncertain—made it seem ominous.

While the surface of the ship looked like crystal, it was soft in a way that she wanted to think of as foam. What it really reminded her of was skin. The magnetic locks bound her to it in a rough, uncomfortable cradle, or would once the ship was under way. Provided that the magnetic locks held on. The red glow that said they were clamped was solid, except that every now and then she thought she caught a flicker of amber. The other ten members of the insertion team besides her and Amos were all using the same equipment. Their suits were all low-level environment suits. None of

them had better than welder's padding as armor. They looked more like a cleaning crew than a crack military force. It worried her how true that might be, but that was for after the locks held. If the *Storm* pushed off from the dock and left them all floating behind it like a snake's shed skin, it would be up to Alex to solve the problem of the enemy destroyer. And they'd probably all die. There was no upside.

"*Really* hope these hold," Bobbie said.

The encrypted alert came. Bobbie tapped her forearm controls. When Alex's voice came through, it had the thick Mariner Valley drawl that meant he was scared shitless but also a little euphoric on the fear. "This is Alex Kamal of the *Rocinante* calling out to my friends and family and all ships at sea. We are about to start this rodeo. Breaking loose from the docking clamps in ten. Nine ..."

"Brace," Bobbie said. "We don't know how fast this is going to happen."

She took the nylon cords, tracked them in tight, and waited for the *Gathering Storm* to leave port.

In order to get there, they'd crawled out from the elevator shaft that ran the length of the station from the command and control at the bow down to engineering at the stern. They'd moved quickly, skimming along centimeters above the station. The others had been laughing until Bobbie reminded them that low-power radio wasn't radio silence and politely suggested they all shut the fuck up instead of getting the team killed. After that, she'd been alone with the sound of her own breath, the smells of old rubber and someone else's sweat. Alex had been on her right, Amos on her left, and the dock spiked with ships a quarter of a klick before them. Past that, just the blackness of the slow zone, and the killing nothingness beyond the gates.

The drum had spun beneath them. The scars and damage from the brief battle with the *Storm* still showed in blackened streaks and bright patch foam. Medina had taken more than her fair share of licks in her life, and today wasn't going to be any better.

They'd pulled out every trick that any of Saba's underground had up their sleeves. Stealing the welding rigs, uncrating the hidden caches of

weapons, compromising the access shaft that let them through. Ever since the Laconians had come through the gate, smart people familiar with the station had been planning for this moment. Maybe since before that, if some of them were smugglers.

As they passed over the last of the drum, Alex split off. He had to make his way almost a third of the way anti-spinward from the *Storm* to reach the *Rocinante*. She told herself it wasn't the last time she'd see him as if she knew it were true. Then with a flick of her fist, she'd directed the insertion team toward the dark, looming form of the destroyer.

The plan was to lure the *Gathering Storm* off the station. As soon as its docking clamps were off and no new soldiers could get on, Bobbie and Amos would breach the hull and lead an insertion and take the *Storm* off the playing field. Whether they did that by blowing its reactor, sabotaging its controls, or steering it out toward the nothingness between the gates was going to be a game-day call once she was inside. Without better knowledge of the ship's internal workings, improvising was a better option than pretending she could make a solid plan.

The secondary objective was to get her people off the *Storm* and safely picked up by one of the fleeing ships. The tertiary objective was to get away herself.

Alex reached zero, and Bobbie thought she felt a little tremor through the *Storm* as the *Roci* blew her clamps and spun out away from the docks using the body of Medina as cover. Two of her magnetic locks flickered amber, and then safely back to red.

It was a day with a lot of ways to die packed in it. Like Alex, she couldn't keep from grinning. Maybe it was a Martian thing. She stayed braced, her feet against the hull, knees bent. The minutes stretched. The blower in her helmet felt cold against her forehead. That meant she was starting to sweat.

"How you holding together there, Babs?" Amos asked. The radio made it sound like he was half a klick away and whispering.

"I'll be fine once they get this ship out of dock."

"Yeah. Not really leaping into action, are they?"

“We were hoping to catch them flat-footed.”

“That’s true,” Amos said. “Still.”

“Maybe they didn’t notice,” one of the others said.

Or maybe they’re waiting for more troops to get on board, Bobbie thought, and the *Gathering Storm* surged out to the black, snapping the nylon bands taut.

They were on maneuvering thrusters. Fifteen meters down from them, a blast of superheated steam vented, pushing the destroyer into a fast rotation. It didn’t seem to come from anyplace, as if the thruster were hidden under the weird not-metal of the hull until they wanted it. Good thing they hadn’t set up their camp there or at least one of them would probably have been blasted off the ship and cooked to death already.

The *Storm* lurched. The rumble of the thrusters translated itself up her legs. Medina fell away like someone had dropped it. The drive plume of the *Storm*’s main drive flared, and the ship jumped forward. Only about a quarter of a g. They weren’t going to risk melting Medina to slag. Still, it was a little eerie seeing her shadow stretched long ahead of her on the body of the ship. A reminder that if she fell, she’d die in fire.

“Amos,” she said. “Make us a hole.”

“I see you coming after me,” Alex shout-sang. “You ain’t catching the *Roci*, friend. We’re just too damned pretty for you.”

“Alex, get off this channel,” she yelled, then remembered that her signal was intentionally too weak to carry. She shook her head and hoped he wouldn’t be too distracting.

Amos had the welding kit out, power supply strapped to his side. With two broken ribs, she figured the rig had to hurt like hell, but nothing about his movement betrayed the pain. Her own cracked tailbone wasn’t making it any more comfortable either. They’d done themselves a lot of damage getting this far. She had to make sure it didn’t make a difference. Pain was just her body telling her something. She could choose to ignore it. Amos held the torch to the hull, and everything went bright. Sparks seemed to stream away behind them, curving down and vanishing against the hull like gravity was pulling them and not just the turning of the ship.

“Weapons ready,” she barked, and the others acknowledged. If the destroyer had the double-hulled design that all Martian ships had, cutting their way through here would only be the first step. But it was a critical one. There was damage they could do there, but it was also difficult to defend,

and with none of the *Storm's* crew there, tactics like flooding it with hydrogen and oxygen could take out her whole team without risk to the enemy. Tempting as it was, she had to get into the ship proper, and—

“Ah, Babs? This is weird as shit.”

Amos stood braced. The cut from the welding torch was a line of brightness in the hull half a meter long. Half a meter long and shrinking fast.

“What have we got?”

“Remember how it looked like the hull could repair itself? It's doing it now too.”

“That going to be a problem?”

“Yeah,” Amos said. “I'd say that'll make this hard.”

The *Storm* lurched under them. The drive plume brightened below them, and the *Storm* gathered speed. The acceleration pulled the straps taut as the thrust gravity made the nuclear-powered flames of the plume more definitively *down*. The bow-most of Bobbie's magnetic locks flickered amber and slid a few centimeters before it went red again and stopped. The little moment of give shot adrenaline through her body. Her heart was thudding in her ears. Her voice was so calm it sounded like someone else.

“Got any bright ideas?”

“Lemme try something,” he said, and hunkered down.

He cut again, but in a tight curve, not making a hole they could breach through, but something smaller. When he got around it, he punched in, pushing the little core of hull material into the space within the ship. The circle he'd made instantly began closing, but Amos was carving slivers off its edge. He pared the hole wider and wider, even as it fought to narrow. His motions were fast and efficient. He didn't slow down even as the ship bucked and turned under them, the proof of a lifetime's physical labor made into elegance. Bobbie knew that if she'd tried this, she'd never have been able to keep up, but with Amos, the hole grew wider.

“Edges are going to be toasty,” Amos said. “Nothing I can do about that.”

Saba's voice murmured in Bobbie's ear. *Marine fire teams have reached the detention cells. Time to turn our little friends off.*

“Sooner would be better than later,” Bobbie said.

“You ain't wrong about that,” Amos said. He started whistling tunelessly between his teeth. “I'm not going to be able to stop this while folks go

through.”

“Fuck that,” one of the others said. “Not winding up half in and half out, me.”

Bobbie turned to the soldier. “You’ll do as you’re told, or I will shoot you in the head as an example to others,” she said, she thought more politely than the man deserved. “Get next to the hole. You’re going in on one. Three ... two ...”

The man dove through, Amos cutting through the nylon bands as he went. The hole didn’t close over him, but only because Amos kept carving the sides.

“Next up,” Bobbie said, pointing at the nearest soldier. “You. Three. Two. One.”

Again and again, Bobbie shoved one of her team through the molten hole of the hull. The abandoned magnetic locks clustered around it like wildflowers in a garden, the cut tethers shifting as the ship shifted. Like seaweed in an unsteady current.

Medina swam above them, and twice Bobbie caught glimpses of the *Rocinante*’s drive plume limning the station like a sunrise that never came.

“Gonna be tight, Babs. This is taking a lot more fuel than I budgeted.”

“Keep going,” she said.

He did. Eight. Nine. Ten. And then it was just the two of them.

“We’re good,” she said. “Give me the rig. I’ll get you in.”

“I appreciate that thought,” Amos said. “But just between you and me? You’re not that good a welder. Head in. I’ll make it.”

“No heroic gestures.”

“Oh, I’m not dying out here,” Amos said, and pointed toward the interior of the ship with his chin. “Worst-case scenario, I’m dying inside there.”

Bobbie shifted her magnetic locks to the edge of the burning hole, then launched through, tucking her legs in. Arms caught her and pulled her to the side. The suits’ worklights filled the space between the hulls with blue-white radiance.

It was eerie. It was familiar as a well-loved face, but wrong. Where spars of titanium, ceramic, and steel should have been, crystals grew. Lines of fracture shot through them and then disappeared like watching lightning discharge in a bottle. Where sheets of metal and carbon lace should have been, seamless blankets of something that she tried to think of as lobster

shell and then fabric and then ice defined the spaces.

It was unmistakably a Martian destroyer. And it was like nothing she'd ever seen before.

"Coming through," Amos said, and she turned to pull him safely to a handhold. The hole where they'd breached squeezed tight. It didn't completely close, but the opening ended up five centimeters across. In the worklights, Amos smiled his empty, amiable smile.

"Well, that part's done," he said. "Hope the next hull's a bit more familiar, if you know what I mean."

Alex was keeping the chase consistent. It was the only reason they weren't being bounced through the space between the hulls like rats in a dryer. The entry into the ship proper was always the most dangerous moment. Bobbie had known that from the start.

They moved quickly, bracing at the hand- and footholds, until they found a stretch of bulkhead. Amos checked the fuel on the welding rig and shook his head, but he didn't speak. The smoke shook and fell away with every turn of the ship like water falling from a faucet. The hull didn't heal itself, but that was the only good thing.

"That's going to be small," she said.

"It's going to get done," Amos said. "Any more, and we'll be trying to bend it to get through."

Amos cut, and air and light spilled in from the other side. The ship's interior was still pressurized. That was odd, for battle conditions. If the crew of the *Storm* hadn't realized they were being boarded, they were finding out now. Bobbie squeezed through first into the back of a bunk room. Two rows of gel-mattress bunks, not that different from the quarters on the *Roci* where the Marine fire teams were meant to sleep. These beds were empty and neat. She took a position by the doorway while the others pushed in. Amos came last, slapping a plastic patch over the hole that bellied out into the space between the hulls like a balloon before it hardened.

"I don't want to shoot you bastards," Alex shouted through the radio. It was a code phrase. The *Storm* was getting close. The *Roci*'s evasions were going to fail, and soon.

Bobbie popped the door open, ducked her head out and back, and a bullet tore a streak out of the frame where her skull had been.

"How many?" the man beside her asked.

“At least one.” She looked around the bunk room for something—anything—that would give them the edge. “This place is a death trap, and we’re out of time. You three, with me. You two go in firing left, you to the right with me. If you see a grenade or anything that might be one, duck back in. Everyone else, into the bunks, on your backs. Set up to shoot between your feet if the bad guys rush the door. You have four seconds. Go.”

She picked high when they went out. The woman crouched down beside her could have been anyone, but their lives depended on each other now. Down the corridor, Bobbie saw the intersection where the fire had come from before. A single head bobbed out and back. She aimed for it, but she couldn’t tell if she hit.

Another doorway stood across the hall. She pointed and gestured. They made the crossing in a rush. Another cabin. Bunks for twelve, but no sign that they’d been used. No one fired at them. Whoever had tried before was down or fled. Going for whatever reinforcements the ship had. Surprise had gotten them this far. Skill had to take it from here.

“Amos?” she said into the radio.

The walls of the ship attenuated his response, but she could still hear him. “Babs? How do you want to play this one?”

It had been too many years since her ship tactics, but this one at least was easy. The ship had two points of vulnerability to boarding attack—engineering and command. The enemy had the home-field advantage, but if they were understaffed, they’d protect whichever one they thought she was making a play for. So the smart thing was to feint at one and hit the other.

“I’m taking these five and heading for ops. Wait two minutes, then take yours for engineering.”

“You got it. Are we looking to disable or blow up?”

The *Storm* lurched again. A smooth rattling sound echoed through the ship like a chain slipping off a shelf. It was different enough from what she was used to that she almost didn’t recognize it as PDC fire. They were going for the *Roci*.

Before she could speak, Saba’s voice came through on the radio. *Evacuation teams are at the docks. Waiting for clear sign, yeah?* And then, almost overlapping, Naomi’s answer. *Message received. We’re going in.* The underground’s ships were ready to launch. Medina’s sensor arrays were going down soon. The window was opening. It wouldn’t stay that way long.

“The first thing you find that kills this ship, do it,” Bobbie said.

“What about evac?”

She knew what he meant. If he could blow the reactor, should he? Was the mission more important than living through it?

“Use your judgment, big guy,” she said. “I trust you.”

Chapter Forty-Eight: Clarissa

There were only two ways that she felt anymore. Either she had the shakes or she was exhausted. The shakes part had been nasty when it started because it felt like being scared—jittery and heart racing. And because it felt like fear, she kept thinking she was afraid, and then becoming afraid without any focus or reason. Once she understood it was just her shitty aftermarket endocrine system leaking into her bloodstream, it helped. At least she understood that it wasn't just her going crazy with amorphous anxiety. She still shook, though.

In the worst of it, she'd go back to her old mantra, the one from prison. *I have killed, but I am not a killer. Because a killer is a monster, and monsters aren't afraid.* She felt like she was afraid all the time now, and in that frame, it was almost comforting.

The superstitious part of her kept thinking that she'd invited this shape to come into her life with the sympathetic magic of her words. The rational part thought she'd invited it by paying a shitload of money to have illegal body modifications as part of an insane adolescent revenge fantasy. That and the part where she'd killed a bunch of people.

"You okay?" Naomi asked.

Clarissa lifted her hand in the same Schrödinger's answer she always had, no matter how she expressed it. Always yes, and always no. Yes, I'm fine in that I am not presently in medical collapse. No, having that be what *fine* meant didn't ratify her early life choices.

"You?"

"Fine," Naomi said in a tone of voice that probably meant the same thing. Ever since Holden had been taken, a light had gone out of Naomi's eyes. After discovering the *Lightbreaker* was gone and Holden with it, Naomi wasn't catatonic from grief, and so sure. Fine.

They were waiting on a bench at the edge of a field on the inner face of the drum. Wheat stretched out to their right, curving up and away from

them, ripening in the light of the false sun. A woman in a systems control uniform walked along the path holding a little boy's hand. He stared at Clarissa as they passed. She could practically hear, *What's wrong with that woman, Mommy?* he was thinking it so loud.

It felt a little weird being out among the normal inhabitants of Medina. All of the people going about their lives like they were trying to forget that the Transport Union had ever existed. Picking their kids up from school, eating dinner with their friends, working their jobs and performing their duties as if they'd always done this at the wrong end of a gun. As if Laconian rules were normal. As if there weren't already things in play that were going to change everything before night.

"I'm sorry about Holden," Clarissa said. She hadn't meant to, but she did.

Naomi took a quick breath, let it out. Like someone ripping off a bandage that had adhered a little too much to her skin. A quick pain, and then over with. "Thank you. It's not ... what I was expecting."

"Yeah," Clarissa said. "It seems like there's always the way we wanted things to go, and there's what actually happens."

A warning tone sounded through the drum, echoing with the distance and the free air. An artificial voice reassured them with its tone while it repeated, *This is an emergency alert. Report to shelters immediately and await official instructions.*

"Listen," Naomi said. "They're playing our song."

"Oh my," Clarissa said, laughing. "We have lived our lives wrong, haven't we?"

Naomi took her arm, half as a joke and half to give her support if she needed it, and they started toward the rendezvous. Clarissa's body twitched and shuddered as she walked. Once they went below, into the corridors and halls of the drum, the traffic thickened. The alert sounded from every corner. Businesses closed their doors. Kiosks shut down. Everywhere, people moved quickly, some shouting and angry, but most with a kind of deathly focus. They'd had too many explosions and too much violence for any joking around. The illusion that life was normal for any of them vanished.

She and Naomi waited for a gap in the flow of bodies, then ducked into a public restroom. Clarissa sat on the couch built into the wall. She felt a little nausea haunting the back of her throat, but it wasn't bad. Naomi went

to the sink and washed her hands slowly, not to make them clean but to make it look like they weren't just loitering in the place should anyone from station security come in.

The plan—their part of it anyway—was simple enough. Or at least it was from Clarissa's perspective. She'd tried to walk Alex through it once, and she was pretty sure he'd only followed about half. The sensor arrays on the Medina were all linked to the main system, but they all had their own backup batteries. Shutting down the power would keep Medina from seeing where the ships went in real time, but it wouldn't clear the local caches in all the sensor arrays. As soon as the power grid came back, the arrays would check in, reconnect, and deliver everything they'd saved.

And that process right there had a vulnerability in it. When the arrays checked in to reconnect, the system could request a diagnostic run. The arrays would take about twenty seconds to cycle through their diagnostics and return the results with a fresh check-in. During those twenty seconds, no new data came in. And if the array check-in requests got routed to a false system that only replied with diagnostic requests, they could keep doing that until some poor bastard figured out where the false route was coming from or else physically went out to the arrays and ran a new dedicated line.

When she'd gotten to about this point in the description, Alex's eyes had lost their focus, and she'd simplified. Make a fake traffic card. Put the fake traffic card in at the secondary power junction. Blow the primary power junction to reset all the arrays. Arrays don't come back on without a lot of tedious work. She'd gotten a thumbs-up from him then. It had been cute.

It was always strange to remember that she knew things that other people didn't. Not just about power- and signal-routing protocols. What it was like to murder someone who'd only ever been kind to you. How it felt when the people you'd dedicated your life to killing took you in as family. Even though she knew better, she always defaulted to the idea that her life wasn't singular. That whatever she'd done must not have been that odd, because after all, she'd done it.

The door opened and the bomb guy came in carrying a ceramic toolbox. Jordao. He nodded to Clarissa and then to Naomi. Between the hunch in his back and his ashy skin, he looked like a sample picture of "furtive possible terrorist." *If we're going to pull this off, that guy's going to have to calm the fuck down.*

"Hey," Clarissa said.

“Hoy,” he responded. “Bist bien?”

“No problems so far,” Naomi said. “But we’ve been out of touch. You heard anything?”

“Unauthorized launch,” Jordao said as he set the toolbox beside the sink and opened it. “Nos ew bû?”

“Yes, that’s one of ours.”

“Perdí,” he said, forcing a grin. “How many plays playing in one day?”

“One less if we don’t move,” Naomi said.

Jordao opened the case and tossed earpieces to her and Naomi before fitting his own. “Katria, she didn’t *parle ero que la*, right? They’re going to be down on us hard after this. *Alles la preva*? Look like we were in a kids’ school.”

“If this works the way it’s supposed to, that won’t be a problem,” Clarissa said, shifting the earpiece so it was a little more comfortable. “Just stick with us, and you’ll be fine.”

Naomi dried her hands, pulled her hand terminal out of her pocket, checked it, put it back. “We should go,” she said.

Jordao closed the toolbox, hoisted it onto his hip, and followed Naomi out. Clarissa brought up the rear. The shakes were a little better. A little less. That was sort of a good thing, because she hated the shakes. It was sort of bad, because the exhaustion came next, and she needed to get through the mission. At least enough not to slow Naomi down.

Outside, the halls were emptier. *This is an emergency alert. Report to shelters immediately and await official instructions.* Naomi turned toward the ramp leading down toward the outside of the station. Clarissa put her hands in her pockets and tried to look bored. Her mind divided itself gracefully between rehearsing the steps that she’d need to take to swap traffic cards and watching for security patrols. When Saba broke the silence, it startled her.

“Evacuation teams are at the docks. Waiting for clear sign, yeah?”

Naomi put a hand to her ear. Hearing her through the earpiece and in person at the same time gave her words a little echo. Like they had more weight than they should have.

“Message received,” she said. “We’re going in.”

It would only take a couple of minutes to swap the card and set the charges. After that, they’d get to the docks if Saba’s people could hold them that long, or if Laconian security retook them, an airlock. Naomi paused at

an access panel, checked her hand terminal, and nodded. This was the one. Jordao was sweating and pale. He looked worse than she did.

"It's going to be okay," she said. "We have a surprising amount of experience with weird situations."

Naomi leaned against the access panel. A security drone passed through the intersection behind them, but didn't turn their way. Clarissa felt a little surge of adrenaline, but it only served to highlight the growing torpor in her muscles. *Do this*, she thought. *Get this done. You can rest when you're dead.*

The access panel clicked and slid down.

"What are we doing here?" Jordao said. "Got to go, us."

"We're doing the thing that makes the next part matter," Naomi said, then stepped aside. The guts of the ship would have looked chaotic to anyone who didn't know the things she did. For her, there was a simple logic in every weld, every conduit, every connector. She took the doctored traffic card out of her pocket, plucked the old one out, and slotted hers in. The fault indicator barely blinked to amber, and then went back to a flickering, happy green.

"Okay," she said, sliding the panel back into place. "Let's go set the charges."

But when she started walking, she knew it was going to be harder than she thought. If they moved fast enough, they'd be done before she ran out of energy. That was why Naomi was here, after all. Because none of them thought she could do it by herself. Because they weren't necessarily wrong.

The worst part was that she'd done it to herself. The damage to her body, the wear and the weariness, were all products of conscious, determined choices made by a girl she hadn't been in decades. She carried the weight of those decisions like a sack of bones. Like a toolbox full of them.

Some sins carried their own punishment. Sometimes redemption meant carrying the past with you forever. She'd gotten used to that over the years, but it was still pretty fucking inconvenient.

"Down here," Jordao said, waving them on.

"I know," Naomi said.

The door to the primary power junction was reinforced. A red border was painted around the frame, with warnings in half a dozen languages that all meant *Please be careful. There's a lot of things in here that we'll have to*

fix after they finish killing you.

Jordao opened the door, and Naomi stepped past him into the maintenance way beyond—

And then stepped backward, her arms rising. Running footsteps came from behind her, sudden and loud. A young man in the blue uniform of Laconian security stepped out from the red door, a pistol leveled at Naomi's stomach. Rough hands grabbed Clarissa by the shoulder and threw her to the floor. Jordao leaned against the wall and sank down to sitting.

"There a problem, sir?" Naomi asked, her voice the perfect echo of innocence.

"Knees," the pistol man said. "And keep your arms up while you do it."

Naomi looked down at her. Clarissa saw no sorrow in her eyes, only calculation. And then a conclusion. Naomi sank to her knees. Jordao's head was leaned back, looking at the ceiling and taking deep gulping breaths. He still had the toolbox under his arm, and she thought he might be about to set off the charges and turn them all to paste, until he started laughing. It wasn't mirth or gloating, but it was relief. Even before he spoke, Clarissa understood they'd been sold out. She laid her head against the rubber matting on the deck as someone put a knee in the small of her back and started pulling her arms behind her. The exhaustion was coming on stronger now. The deck felt almost comfortable.

"There's a thing," Jordao said. "A thing they put behind an access panel. No savvy *mé que*, but I can show you where, yeah?"

"What was it?" the pistol asked Naomi.

Naomi shook her head ruefully. "Afraid you're going to have to go fuck yourself, coyo."

He hit her, stepped forward. Clarissa felt the zip tie going around her right wrist while the guy fumbled with her left. She rolled her head. Five of them, all told. All with guns drawn. The pistol came down, ready to end Naomi where she lay.

"You're sure you can find whatever it is?" the man said.

"Course I am," Jordao said. "Where are your Marines? You said there'd be Marines."

"Change of plan. They're statues until we can get the lockdown codes undone." He looked down at Naomi. "Was that yours too, bitch?"

Naomi locked eyes with Clarissa. The calculation was gone. They were out of options. Which meant, really, that Naomi was out.

Clarissa always had one left.

It was a weird moment. Through the bone-weary tiredness, through the fear and the panic and the anger, something else opened up. Something like rage and joy, and more than all that, a profound relief. Naomi saw it in her expression, and her eyes widened. Clarissa pressed her tongue against the roof of her mouth, swirled it the way she hadn't in years. The fake glands in her body triggered, pouring their shit into her blood. It hurt. It didn't use to hurt, but this time, every one of them ached. Even the pain felt good.

Time slowed down around her. She bucked and the man on her back fell forward. He still had a hand on her right wrist, and he kept his grip as he fell. She felt her shoulder dislocate and heard the deep pop, but there wasn't any pain. Her legs were under her and she pushed off before he hit the floor. Her right arm was shredded and useless. Her muscles were thin and fragile. Just jumping, she felt the tendons in her knees and hips strain and rip, but she was already rolling, ready to hit the wall and launch again.

Pistol man didn't shift his aim from Naomi, but the other three were drawing down on her, moving slowly as someone underwater. One pistol barked, but the shot only tore into the anti-spalling fabric on the wall.

Clarissa spun through the air, her ruined arm trailing behind her. She led with her knee, and it felt like dancing. Like flying. Her aim was still good. She brought her bent knee into pistol man's nose, felt the cartilage give in her joint and his face, the two of them crumbling together.

She'd been sick for so long, she'd let it make her fragile. So much of her life had become nurturing what fading health she had. Rationing it like one canteen that had to get her across a desert. Now she gulped it, and it felt wonderful.

The two who hadn't fired did now at almost the same instant. One missed, but one bullet dug into the thin meat over her ribs. It hurt, but the pain was distant. She barreled into the closest of them. As they fell, she wrapped her good arm around his head, cradling it carefully so that when they landed, she could snap his neck. She hit the deck hard, pulled, and felt his spine give way.

I have killed. But I am not a killer.

She caught up the gun from his hand as the others turned. Clarissa felt the battle cry in her throat, felt the force of air and sound rattling her trachea. Felt the gun she'd stolen kick. The woman nearest her fired wild, and Clarissa placed a bullet in the woman's cheek, snapping her head back.

That was two. The one who'd been on Clarissa's back jumped toward her. She put a bullet through his teeth. Three.

Naomi was scrambling for pistol man's fallen weapon. He was still down, holding his shattered nose like that was his biggest problem. Clarissa shot him twice in the center of mass.

There was only one guard left, and he was close to Clarissa. She could see down the barrel of his gun. She saw the fear in his eyes. He fired. He couldn't miss. Her leg gave way under her, but she fired a shot on the way down. It took the last guard in the throat. She landed hard, but her blood was still made from light and rapture. She rolled, knelt. Her abdomen ached and it was hard to pull in a full breath. Jordao looked at her like he was seeing the devil.

No! I'm sorry! he shouted in some universe close to hers.

Fuck your sorry. Sorry doesn't fix shit. She didn't know if she'd yelled or if it was just in her head. Either way, she shot him—once in the belly and when he doubled over, the crown of his head right where a little bald spot was just starting. Then the rush was over.

It wasn't as bad as she'd remembered. There was the retching and the feeling of illness. The helplessness. The pain. But at some point all of that had become familiar, so the experience of it wasn't as bad. Or else she was slipping into shock.

Shock, or something like it.

Naomi cradled her head and she noticed she was lying down. Her mouth tasted like bile. The guards and the traitor were spread throughout the hallway. The air stank of blood and gunpowder. It looked like a scene from hell. All of the years she'd spent living with her regret, doing quiet penance for the lives she'd ended, and now the only thing she could think was *That was fun*.

Words were happening somewhere nearby. *Stay with me, Claire.* She remembered Naomi was there and opened her eyes again. She didn't remember closing them. Naomi was spattered with blood, her face pale. Ren stood behind her. He was wearing some kind of black robe that made her think of Jesuits.

"I'm a monster," Clarissa said.

No you aren't, baby. You're not a monster. You're not. Which meant Naomi had misunderstood. Clarissa had meant, *I'm not afraid*. She tried to think what to say that would clarify that, but it was a lot of effort. And what

did it matter really if anyone else understood? She knew.
Fuck it, she thought. Some things you take to your grave.
Clarissa Melpomene Mao closed her eyes.

Chapter Forty-Nine: Bobbie

When she was young, Bobbie had a recurring dream of finding a door in her room that led to some new, exotic part of her quarters that her family had forgotten or else never known about. Those dreams had been eerie but also beautiful. Full of promise and wonder and threat.

The *Gathering Storm* was exactly like being in one of those dreams.

The architecture of the ship had all the same aesthetics and design as the *Rocinante*. The central lift, the size and spacing of the hallways and doors, even the shapes of the hand- and foot-holds were familiar. Or if not exactly familiar, at least related. Part of the same family. Laconian and Martian had the same cultural DNA, and as much as anything else, the ship proved it.

But it was also *strange*. The decks didn't have seams or bolts. The foam and fabric on the bulkheads had the same uncanny fleshy texture as the hull. The lights were different somehow too. She didn't know if it was the spectrum or the brightness or the way that there seemed to be some kind of subtle motion in them, but everything felt a little bit like being underwater. Like the ship was a huge fish with the bioluminescent glow of the deepest seas.

It was home, but wider, larger, and *changed*.

They moved from hall to hall in strict formation, covering each other as they went. The rattle of PDCs was joined by something else she didn't recognize. Some Laconian version of torpedo fire was her best guess. The deck lurched and canted as the ship maneuvered around them, but the main drive never cut out, so down was always down.

She'd expected the ship's defenses to meet them at the central lift that led to ops. It was the obvious choke point, and holding that space meant controlling movement between all the decks it passed through. If she'd been in charge, all the hatches would have been open and a dozen rifles pointing down, ready to put holes through any head that popped out. Instead, there had been three Laconians with pistols retreating up it, and firing behind

them, more to discourage Bobbie and her people from following them than to actually injure anyone. They were holing up on the command deck. She wasn't sure whether that was a good thing or a bad one.

"Amos?" she said, and when he didn't answer, turned up her broadcast power. "Amos, check in."

"Little hairy down here, Babs," Amos replied. "Made it to what I'm pretty sure is supposed to be a machine shop. Fucked if I know what half this stuff is, though."

"Any contact with the enemy?"

"Yeah, we lost a couple."

The sound that interrupted them was like something metal being torn by brute strength. It took a fraction of a second to recognize it as high-rate weapons fire. Amos was shouting over it—not to her. She waited, tension knotting her gut. She wanted to know what was happening, but not badly enough to divide Amos' attention. He grunted once, and she was sure he'd been hit. Something loud happened—a grenade, maybe—and the firing stopped.

"Still with me, big man?"

"Yeah," he said. "We just had a little thing there. Architecture's a little weird. And it looks like there's a bunch of stuff down here built out of ... I don't know. Crystals? Or bug shells? You remember those buildings on Ilus? Like them."

The deck shifted hard to the right, and Bobbie's head went a little swimmy from the Coriolis. She grabbed onto a handhold.

"I wasn't on Ilus."

"Oh right," Amos said. "Well, like them anyway. But yeah, we're kinda stuck where we are unless we can make another hole. We're looking for something to cut through the bulkhead with. Would like to get that done before they decide to rush us."

Alex's voice cut in. He wouldn't be able to hear them unless she turned up her broadcast power a lot more, but the *Roci's* transmitters had more than power enough. "Hey, y'all. The *Storm's* breaking off our little dance out here. It looks like she's trying to get back to port. Might be a good time to launch anyone that wants to get launched. You're getting short on time."

Saba responded. "Still waiting for the prison stragglers. Any ship's ready, I'll get them gone, but keep that bastard off us as long as you can, yeah?"

“I’m on it,” Alex said.

Bobbie ground her teeth. She wanted to break off, head down to back up Amos and his squad. Bad tactics. She needed to stick to the plan. Amos was going to be all right. She had to believe that. The lift tube went up the length of the ship, all the way to the ops deck. No one was waiting up there that she could see. That didn’t mean no one was waiting.

“All right,” she said to her team. “This is going to be just the same. Two move forward while three cover, and then the forward pair cover while the three catch up. Only instead of going from door to door, we’re going up from deck to deck. If we start drawing fire, we’ll try to get the lift going up before us, but it’s probably locked down, and I don’t want to announce where we are.”

The Belters all gave their assent and took position. Bobbie and a tall man went first, climbing the handholds like they were free-climbing. She glanced over the top of the deck before she climbed up, but she would have been surprised to find an ambush there.

She leaned against the wall, gun pointed up. It looked like the hatch to ops was closed. Leaving the rest open gave the defenders a great line of fire, but they weren’t using it. Not yet. She gestured to the others, and didn’t take her eye off the enemy as they scrambled up beside her. The *Storm* was bigger than the *Roci*. There were eight more decks between her and ops. That last step was going to be tricky, but—

Gravity cut out, and she grabbed for a handhold by reflex as the ship spun around her, sweeping her legs perpendicular to the deck. As suddenly as it had cut out, it came back. A hard burn—four or five gs slamming her down. The impact knocked the breath out of her, and then gravity cut out again, a moment of spin on the float and another high-g microburn. She and her team were braced now. The float and burn happened three more times. It seemed ready to keep going forever.

“Amos?”

“Hey there, Babs.”

“Is this you? Did you break something?”

“Nope. Whatever they’re doing, this here is the product of conscious choice.”

“I think—” A hard burn made her grit her teeth. Then the float. “I think they’re trying to shake us around like bugs in a can.”

Hard burn, and the float. “That’s going make this inconvenient. They

trying to slow us down?”

“Until they can get back to port.” Hard burn, and float. Her mind shifted. Delaying and heading back to the docks made the most sense if the *Storm* was undercrewed. It also explained why she wasn’t catching heavier fire from the command deck. If the Laconians could get back to reinforcements, she wouldn’t have a chance. And if she didn’t, no one else would either.

Two more cycles of float, turn, and slam her into the deck failed to dislodge her from her place. When Amos spoke again, she could hear the effort in his voice. “That could be a problem.”

“That’s what I was thinking.”

Another round of gunfire pressed its way through the radio. “Not sure I’m going to be able to stop that from happening.”

“All right,” Bobbie said. “New orders. Don’t die until I say so.”

“If I find a way to kill this bird?”

“Then act like I said so, but don’t stick your head out just to look for it.”

“You got a plan?” Amos asked.

“That’d be generous,” she said, “but I’ve got something I’m going to do.”

The ship kept doing its stuttering bounce like one of the first-generation exploration ships that exploded nuclear bombs as a propulsion system. Even for the crew that made it to crash couches, it was a miserable way to travel. She took a deep breath, felt the rhythm of it, and on the next float, pulled herself out to the lift shaft. Two good handholds, two good footholds, and suddenly she weighed five times her usual.

Her fingers and toes screamed in protest. Her back and shoulder flirted with cramping. The float came back, and the ship turned, but she was climbing up. Just one set of handholds before the weight came back. But she was closer.

If she fell, it was a long way to the bottom. But no one was going to be shooting down at her during this, and they didn’t think she could climb while this was going on. That was it as much as anything. With every round of release and spin and high-g burn, she made her way higher, not looking back to see whether her team was with her. She needed all of her focus for this.

Sweat beaded on her forehead, and the suit’s helmet fan kicked up to high so that her faceplate wouldn’t fog up. She was burning through oxygen fast enough that a three-hour supply would last her maybe one. She thought

about taking a break at one of the decks along the way and stripping off her helmet entirely, but if the Laconians decided to vent the ship after that ... well, that would be unfortunate. Better to play it safe. Or as safe as free-climbing with a full destroyer's depth of decks below her in radically uncertain gravity could be.

Saba's voice came again when Bobbie still had three more decks to go before she hit ops. "Sensor arrays are down. We're launching everything. No more time to wait."

"I'll try to keep you covered, *Malaclypse*," Alex said. "The *Storm* is live and a threat. I can try knocking her torpedoes down, but treat her like she's got teeth."

"Bien," Saba said. "And I have a package on its way to you, *Rocinante*. Keep an open eye."

Alex swore under his breath. She didn't have time to guess why.

Another moment of float. Another collapse into terrible weight. The temptation to go faster, to try for two handholds up instead of just one, was a trap. It meant less time to get braced, and that was an invitation to fall. It hurt. It took forever. It was the right way. She couldn't get greedy. The pain in her hands was getting worse, but her feet almost seemed to be getting used to it. That or they were going numb.

She was over halfway up. Three and a half more decks, and she'd be at the ops deck. At the closed plate that kept the lift locked in place. Two and a half. One more. The float came again. She moved up. Her eyes were fixed on the seam where the lift plate would slide open. Where, if this was like the other Martian ships she'd been in, it would make the most sense to take cover and fire down at the boarders. At her. She waited for the next acceleration, but it didn't come. Only a gentle press as the ship maneuvered.

That was bad.

"The *Storm* is on approach to the dock," Alex said, and his voice sounded like ashes. "Anybody has a good idea, I'm listening."

Her arms and legs were trembling from the effort, and sweat stung her eyes. She risked looking down. Her team was following, but they were only about halfway up. This one was hers.

Voices came from the ops deck. Sharp, barked orders. A clattering, probably from a weapon's locker. They knew there wouldn't be much time, but they were also thinking she had a lot more territory to cover than she did. The lift plate slid aside, and she reached in and took the blue-sleeved

arm by the elbow and hauled the man attached to it through and down. He bounced against a couple walls before he caught himself, and by then her team had their guns on him and Bobbie was through the opening and onto the ops deck.

Three people, in the most oddly designed crash couches she'd ever seen. Bobbie raised her pistol. Definitely undercrewed.

A fair-haired man saw her first, and yelled, "Commander Davenport!"

An older man moved forward. Older than the others, anyway. He still looked like a puppy. "Get us into the dock! Whatever happens!"

"I am Gunnery Sergeant Roberta Draper of the MMC," Bobbie snapped. "I will kill every one of you if anyone touches the controls."

Davenport lifted a defiant chin. "You have your orders."

"Doesn't have to go like that," Bobbie said. "You know where that ends us. Your people dead. Mine too. Probably a lot of civilians if I have to ram this boat into the station to kill it. I said, *Don't touch those controls.*"

The pilot flinched back, shot a look at Davenport. He stared hard at her, like he was looking at his death. Like he was trying to talk himself into being brave and hadn't quite managed it yet. There was a chance there in the space between who he was and who he was trying to be. Killing these three wouldn't fix the situation in engineering. Wouldn't save Amos. Behind her, her team was floating up onto the command deck. She wished they wouldn't. More pressure on the Laconians was only going to cement their position. When she spoke, she tried to make her voice calm and soothing.

"Here's the situation. All your people die and all mine too, or all of us live. Now, you can decide whether this bunch of amateurs and assholes is worth a crew of Laconia's best."

"Hey!" one of her team said. She ignored him.

"You expect me to believe you won't steal the ship?" Davenport said. *Well, I wasn't planning to until just now,* Bobbie thought. *But since you mention it ...*

"I'm not talking about the ship. I'm talking about you and yours either put out an airlock with suits and bottles or else killed here."

"I've seen the way you people work," he spat. "If we put down arms, you'll kill us anyway. You have no honor."

"Bite your fucking tongue," Bobbie said. "I'm Martian Marine Corps. If you live through this, you go ask your old-timers what that means. They'll

tell you how lucky you are I didn't crack your ass the other way just for saying it. If I say you and yours are safe, then you're fucking safe."

Davenport said nothing, but there was something behind his defiance. She thought it might be hope. She opened a connection to Amos.

"Hey, big man."

"Hey, Babs," he said. He sounded winded. "I got us into engineering. Gimme another five minutes, I can light this bastard up. May take a bite out of the station when we blow, but I figure that's someone else's problem. How's it going up there?"

"Your team needs to stand down," she said. "No aggressive action toward the enemy. Confirm that."

There was silence on the line.

"That's not the plan the way I heard it," Amos said.

"Amos, listen to me. Stand down. Don't blow the ship. And if anyone down there kills another Laconian, I will shoot them myself. Including you. Understood?"

"Yup."

"Stand by. If I need you to go back to plan A, I'll know in about a minute."

Davenport looked from her to her team arrayed behind her. He scowled. Bobbie felt her breath go shallow. She waited.

"Thirty seconds, Mister Davenport," she said.

"You joined the wrong side, gunny," Davenport said. "You should have been one of ours."

Twenty-five minutes later, the surviving crew of the *Gathering Storm* were tethered together in the cargo airlock. Their arms were secured behind their backs, their ankles were tied together, and the maneuvering thrusters on their vac suits didn't have any canisters. Amos and one of his team went through checking their seals one last time and strapping emergency beacons to their knees. The Laconian commanding officer watched Bobbie now with the intensity of someone planning his revenge.

Amos knocked on Davenport's faceplate to get his attention. "Can you breathe in there? Getting good air? 'Cause if you're not, this is the time to

say something.”

He nodded once, a perfect physical representation of resentment.

Outside the *Storm*, ships were fleeing through the gates following the schedule Naomi had built. By and large, they were going to the smaller colonies where there was less traffic parked waiting for the gates to reopen. But some were going to the well-established places like Bara Gaon Complex and trusting to their ability to evade any traffic monitoring on the other side to get them to safety. There was still a little more than an hour before the last of them was slated to go, and then the *Storm*, following up at last. If things went right, Medina’s sensors would be deep in their routing seizures for at least four hours. And the prisoners had enough air for ten. A six-hour window for pickup seemed like more than enough.

Amos gave her the thumbs-up, and Bobbie nodded him on. He undid the tether from the airlock deck, pushed off, and floated through to pull himself to a stop beside her. Bobbie cycled the lock, and when the outer door opened to the darker-than-space of the slow zone, she touched her radio.

“Okay,” she said. “Let’s see if the controls work the way they said.”

“Copy that, bossman,” her new Belter pilot said.

The *Storm* shifted, pushing gently to the side. The prisoners seemed to float away, though really Bobbie was the one moving. Out beyond them in the darkness, a distant drive plume glowed like a star, and then, passing through a gate, went out.

“Okay,” she said. “We’re good. Make sure we get far enough away before we light up the drive. I don’t want to save them just so you can burn them down in the drive plume.”

“Sa sa,” the pilot said.

“Alex?” she said, then remembered her suit was still on the low-power stealth settings. She changed it and tried again. “Alex? Where do we stand?”

A different voice answered. A man that it took Bobbie a few seconds to recognize. “We’re huddled close to Medina for the extraction.”

“Houston?” she said. “Is that you?”

“Now that you fuckers have come to your senses about the immorality of centralized power? Yeah, it’s me. And I’m ready to accept your apology as soon as you untwist your diapers.”

“He’s gonna be a joy,” Amos said placidly. “I kind of missed him.”

Bobbie killed her mic. “I can’t tell if you’re being sarcastic. I need to

know these things.” She turned the mic back on. “We have a change of plan. We won’t need pickup.”

“Negative,” Alex said. “I’m not leaving you behind.”

“We’re flying escort,” Bobbie said. “The *Storm* is ours.”

“No shit?” Alex said, then whooped. “Holy crap, you took a prize? Looks like you got yourself a ship after all, Captain Draper.”

Naomi’s voice cut in, clipping into Alex’s last syllables. “I’m coming out.”

“All right,” Alex said. “Two to pick up, and then we can get in the flight queue out of this dump.”

“One,” Naomi said. “One to pick up. We ran into a problem. Clarissa went down fighting. I wouldn’t have made it out without her. None of us would.”

Bobbie’s throat went tight. She looked over at Amos, and he smiled his usual amiable smile, shrugged. Just for a moment, she saw something underneath the expression. Pain and loss and sorrow and rage, and then he was just himself again.

“Damn,” Alex said. “I’m sorry to hear that.”

“Okay,” Houston said. “I have you on the scope. We’ll slide over and get you.”

“Naomi,” Bobbie said. “When you get on the *Roci*, I’ll need you to find a safe place for the *Storm* in the escape queue.”

“I’m on it,” Naomi said. Now that Bobbie knew to listen, she heard the exhaustion in her voice. The weariness of grief. She turned off her mic, turned toward Amos, but he was pulling himself back toward the lift. She followed him, a little trickle of adrenaline coming in. Waiting to see what was coming next.

At the lift, Amos stopped and scratched his nose. “I was thinking I should probably get a few of the new kids. Go through the ship. Just make sure we don’t have anyone on board we didn’t mean to have on the ride.”

For a moment, she thought about letting it go. Letting Amos fall back into his usual self. It would be easier. It would feel more respectful.

It was what Holden would have done.

“I need to know if you’re okay,” she said.

“I don’t really—”

She pulled herself in close, almost nose to nose. She wasn’t smiling and he wasn’t either. “I didn’t ask if you wanted to talk. I said, *I need to know*.

Whatever ship I'm the captain of, if you're on it, that means you and I have clear, open, and honest conversations about your mental health. This isn't friendship. This isn't nurturing. This is me telling you how it goes. We both know what happens when you're off the rails, and I'm not going to pretend that you're anything more or less than what you are. So when I say I need to know if you're okay, it's an order. Are we clear?"

Amos' jaw clenched and his eyes went flat. She didn't back away. When he smiled, it wasn't the empty, amiable expression he usually reached for. It wasn't a version of him she'd seen before.

"I'm sad, Babs. I'm angry. But I'm okay. Going down fighting was a good way for her to go too. I can live with it."

Bobbie let herself drift back. Her heart was going a little faster than she liked, but she kept it off her face. "All right, then. Take your team and go through the ship. I'll warn you when we're going on the burn."

"I'm on it," Amos said. And a moment later, "You know, you're gonna be good at this captain thing."

Chapter Fifty: Singh

This is exactly the kind of recklessness that has been underlying the Transport Union since its inception,” Carrie Fisk said. Her face was flushed, her gestures sharp, and her voice had the buzz of rage behind every word. Her blouse was tan with black, and she wore the green armband that had come to symbolize antiterrorist solidarity among those loyal to Laconia and High Consul Duarte. “The union claimed that stability and safety were their primary mandate. That was the whole point of letting it administrate ring space! But the minute—the *minute*—someone arrives with the power to question that? Bombings. Theft. Murder. The hypocrisy is mind-boggling. It’s *unreal*.”

The interviewer was a young man apparently well known in Sol system and on Medina. Singh watched the man nod and stroke his chin like an ancient sage considering a deep mystical truth. His seriousness made Fisk look even more formidable.

“And would you say the situation is stabilized now?” he asked.

“We can hope it is,” Fisk said as she shook her head *no*. “When I look at the patience that the present administration has shown to us and the violence with which it was answered, it leaves me ... not angry, even. Embarrassed. We called ourselves a civilization, and this thuggery is all we have to offer. I can only hope that the people who were fooled into thinking any of this could be justified are embarrassed too.”

It was a sentence Singh had written himself and delivered to Fisk. She repeated it now as if it were an off-the-cuff thought, and she made it sound mostly convincing.

Of all the things he had done since he’d come to Medina, Fisk and the Laconian Congress of Worlds was by far the most successful. Everything else—moving up the timetable for the *Tempest*’s transit to Sol system, flushing out the underground, managing Medina Station—was tainted.

The catastrophe had lasted five and three-quarter hours from the launch

of James Holden's ship to the restoration of full function to Medina Station. In that time, his best informant and the team sent to back him had been slaughtered, the station's external sensors had been compromised, the Laconian Marine forces neutralized, the detention centers broken open and fifty-two prisoners lost and not yet recovered, twenty union ships had transited through no one knew which gate or gates, and the *Gathering Storm* had been boarded and hijacked.

It was, without exception, the greatest failure of security Singh had ever heard of, and as governor of Medina Station, he had spent almost the whole time hiding in a public toilet. Humiliation sat in his belly like a stone, and he had the distinct sense that it would remain there forever.

Every decision he had made since he'd arrived at Medina returned to him in the light of his failure, and he considered each of them like a wound in his skin. If he had treated the local population with greater caution from the first, would Kasik have lived? If he had chosen to respond to the assassination attempt with a more focused response, would the underground have gained fewer followers and allies? If he had avoided the confusion of restructuring his security forces by retaining Tanaka, would they have exposed the underground in time to prevent this?

The list seemed to go on forever. And each choice he'd made—sending the *Storm* out despite Davenport warning him it was undercrewed, shipping James Holden to Laconia instead of questioning him more deeply about the underground, encouraging Trejo and the *Tempest* to move the timetable forward for the transit into Sol system—had led him here. So on some level each of them had been wrong. No matter how wise they had seemed at the time, how forgivable and subtle his failures of judgment had been, the final evidence was unmistakable. He had treated the people of Medina as though he were their leader instead of their warden. Instead of their zookeeper. And they had paid him back with violence, death, and dishonor. All of that was a given now.

There was no standing apart from the failure. It had happened on his watch, and so it was his problem to fix. And it didn't apply only to Medina. He saw that now. His mandate was to coordinate the empire from this, its hub. And that would mean crushing the underground wherever it had fled. Wherever it emerged from the fresh dung heap of the union's demise. He'd thought of Medina as a station to run, a logistical heart to sustain a glorious future for humanity.

He'd been mistaken.

His system chirped a connection request. He checked himself in the monitor, smoothed his hair, and straightened his tunic. He was done looking less than knife sharp. These were, after all, the first days of his career's rehabilitation.

He accepted the request. A woman's face appeared on the screen, a small identifier hovering above her to say who and what she was to him.

"Lieutenant Guillamet," he said crisply.

"Rear Admiral Song of the *Eye of the Typhoon* is requesting command-to-command, Governor."

"Of course," he said. The monitor flickered. He straightened his tunic again and felt immediately self-conscious that he'd done it. It was a sign of insecurity, even if he was the only one who knew about it.

Rear Admiral Song appeared. Her wide mouth was set in a polite smile. The light delay was almost trivial. Evidence that the *Typhoon* was on track to pass through the gate. "Governor Singh," she said. "It's good to see you."

"Likewise," he replied.

"We're on approach to the ring gate," Song said, then looked away. "I'm very sorry, but given everything that's happened recently, I have to ask you this. Can you assure me that this transit is safe?"

Singh settled more deeply into his couch. *Of course it is*, floated at the back of his mouth. *The Typhoon can come through the gate, and there won't be any rogue ship zipping through some other gate in the seconds before to change the safety curve. You and your crew will survive the trip and take its place as the protector of the ring space.*

He swallowed the words. It was like another fine cut on his soul to admit that he wasn't certain.

"I have had no new security alerts," he said. "We see no ships on approach through the other gates and have no reason to suspect any interference from fringe elements. But if you would like, I will consult with my chief of security to make certain we have done everything in our ability to minimize your risk."

"I would appreciate that," Song said, and her tone meant, *I'm sorry to ask it.*

"The safety of your ship and your crew are the most important thing," Singh said. "I understand your caution."

"I'll match orbit with the gate until we hear from you," Song said. "And

thank you, Governor. I do appreciate this.”

He nodded and dropped the connection. She didn’t trust him. Of course she didn’t. He didn’t trust himself.

The Marines who accompanied him on his review of the docks were a mixed group—half of them in power armor and half in standard ballistic plates. Even if the underground managed to disable the power armor again—which Overstreet had assured Singh would be impossible—there would still be a guard ready to take point. Singh hated that they’d had to change their protocol. He hated remembering the fear of realizing his protection was gone, and he hated knowing that the fear would never completely go away. He still didn’t know how the underground had even known the antimutiny protocols existed, much less how they’d managed to reverse engineer them. Was someone—a Laconian—a turncoat? Had they been careless? He had no way of finding where the information had leaked out. It was another little insult that burrowed into his skin.

He maneuvered through the docks on a small thruster of compressed air. The empty berths stared back at him like an accusation. The pocks in the decks and bulkheads where bullets had struck during the fighting hadn’t been buffed out or painted over yet, though they would be. He felt the attention of the dockworkers. They were, after all, the audience for this excursion. Meant to see that the governor of the station wasn’t cowering in his office, afraid to peek out from behind his desk. That he wasn’t hiding in a public restroom. The heavy guard undercut the message, as did the fear in his gut. But he would pretend and pretend and pretend in the hopes that it would somehow become true.

So he lifted his chin, and made his way through the full round of the docks—even where the damage from the bombing of the primary oxygen tanks twisted and deformed the deck. He looked at the temporary plating with what he hoped was dignity and thoughtfulness. All he really wanted was to be done with this and back in his office.

The acting dockmaster followed along just behind him. The anger in her expression was unmistakable, but he didn’t know if it was rage at the terrorists who’d done the damage or at him for not preventing it.

“How long will it take us to make repairs?” he asked.

“That will depend on the supply chain, sir,” she said. “Once we have the *Typhoon*, we should be able to get started in earnest, but they’ve been breaking more than we have the decking to replace.”

“It’s heartbreaking,” he said because he didn’t know what else to say. She didn’t respond. “What is our capacity at this point?”

“It’s not bad. The only berth that took serious damage was the first. Sheared off the docking clamps. Once that old gunship was out, the bastards took over my office. All the rest were released from the controls. That’s one way it could have been worse, I suppose.”

What if he’d brought Natalia and the monster had been here? Laconians had died in these uprisings. If his family had come to Medina, would they have been targets too? Would he have watched his daughter die the way he’d watched Kasik?

And yes, locals suffered too, but to have his people dead and hurt ... And with what repercussions? The criminals had scattered like seeds on the wind, and taken his ship with them. What colony would see these images and not think that they could do the same?

He pushed over to the broken decking and put his hands on it. He’d been weak before. Lenient. He’d thought that by treating the people of Medina as if they were citizens of the empire, they would be transformed somehow. They would be civilized. The decking was half a meter thick, and twisted like a torn leaf. They’d been willing to do this, and he’d pretended he could treat them as if they were sane. Another of his mistakes.

He had hesitated to wield his power before. And the universe had taught him what rewards hesitation brought. Well, he’d learned his lesson.

“Thank you. I understand now,” he said. Possibly to the acting dockmaster. Possibly to something deeper in his own soul. He turned to her. “This won’t happen again.”

“This was what they were building toward,” Overstreet said. “The bad news is, they were by and large quite successful in their aim. I’m not going to make this pretty, sir, they trounced us.”

“I agree,” Singh said.

Overstreet leaned forward in his chair and threw the image from his wrist monitor to the screen over Singh's desk. A list of all the people presently unaccounted for on Medina. The people that they knew had escaped. Or died.

"On the other hand," Overstreet said, "their objective was defensive. This was a retreat. I've had the technicians make a complete audit, and I'm prepared to certify that it's safe for the *Typhoon* to make its transit."

"You're sure about that? Completely safe?"

"I think we've established that perfect knowledge isn't possible in this context. But in order to pull off this last series of attacks, the underground had to spend a tremendous amount of its resources and capital on Medina. If they'd stayed here, they could have used the same knowledge of the station and agents within the civilian population to protract the struggle here for months. Maybe years. Instead, they burned it all in one day."

"So this was a good thing?" Singh said.

"No," Overstreet said. "But it was all the bad things they could throw at us at once. I feel confident that they didn't hold anything back. So however bad this looks—and it looks very bad—we're going to end with Medina carrying a smaller insurgent population, with fewer resources at their disposal, and the main body of the underground scattered to the colonial systems."

"The colonies," Singh said. "Yes."

"The loss of the *Storm* ... well, that's not inconsiderable. If we hadn't pulled most of the crew off to assist with other operations ... Or if your XO had scuttled the ship once it was clear they couldn't repel the boarders ..."

"Talk to me about the colonies," Singh said.

Overstreet blinked his too-blue eyes in something like confusion. "Sir?"

"The colonies," Singh said. "That's where the terrorists have gone. That's where the next wave of this will take place, yes?"

"That matches my analysis, sir."

"So how we proceed here should be considered in light of the colonies. We should examine how likely they are to cooperate with the enemy. And how we can affect those decisions."

"Yes, sir."

"An example needs to be made. Something that not only restores confidence in the safety of Medina and the gate network, but displays what Laconian civilization stands for. What we believe. What we are willing to

do to ensure our control over this situation.”

Overstreet was silent for a moment. Singh paged through the lists of the missing. The faces of the enemy. There were pages of them, but not uncountably many. This was still a solvable problem.

“What exactly are we willing to do, sir?” Overstreet asked, and his tone told Singh that he knew what was coming.

“A white list,” Singh said. “I would like you to identify the people who we are certain are not involved with the insurgency. The people we know absolutely that we can trust.”

“And the others?”

Singh closed the image down. The enemy vanished. “An example has to be made.”

Overstreet went very still. For a moment, the only sound was the hum of the air recyclers.

“I see,” Overstreet said. “So a step up from counterinsurgency.”

“It’s been justified.”

“The official position of the high consul is that these are all Laconian citizens. That the terrorists are Laconian citizens who are also criminals.”

“I know,” Singh said. “But I also know that I was placed in command of Medina to learn from practice what theory can never teach. And this is the lesson that James Holden and his friends have taught me. Will you refuse to respect the chain of command?”

Overstreet chuckled at that. Singh didn’t know why.

“No, sir, I will follow the chain of command, as is my duty.”

“Good. Please prepare the cull, then. I will trust your judgment on who best belongs on the white list.”

“Yes, sir,” Overstreet said. “Only I have other orders. Sir.”

A thrill of confusion moved up Singh’s spine. “Other orders? From whom?”

“Standing orders I received from Colonel Tanaka when I accepted this position. So ultimately from Admiral Trejo. You see, sir, the high consul made it very clear to Admiral Trejo that the rule of the empire is permanent. And if history shows us anything, it’s that people hold grudges for generations. Whole societies have lived and died because of their antipathy born out of events that happened generations before. Or maybe things that got so mythologized, they were just pissed off about stories of things that never happened in the first place. The admiral was adamant that we hold

ourselves to a higher standard. As we always have.” Overstreet spread his hands in a gesture that meant *What can you do?* His right hand held a gun.

Singh felt his heart catch and then stumble like it was running down a hill. “May I ask what your orders are?”

“I’m to set an example, sir. Restore confidence in the safety of Medina and the gate network, and display what Laconian civilization stands for. Including that we who have accepted the burden of government hold ourselves and each other to the highest possible standard.”

Singh stood. His legs felt weak. This wasn’t possible. This wasn’t happening.

“But I was loyal,” he said. “I’ve *obeyed*.”

“You’ve given me an order to kill Laconian citizens who have not been found guilty of a crime.”

“But—”

“For what it’s worth, I don’t disagree with you. These people are scum. They don’t deserve or understand what we’ve brought them. For me, I think they never will. But their children might. Their grandchildren or their great-grandchildren. The story of Medina will be that Governor Singh mismanaged the station, lost his ship to a band of malcontents, lost his perspective. And when he let his wounded pride exceed the mandates of the high consul’s directives, he was removed for the protection of the everyday citizens in his care. You see the difference? If you kill an insurgent, you’re the enemy of all their friends. All their family. And then there’s an expectation. Precedent. Enemies for generations. Forever. If you kill your own—even the highest among your own—to protect someone powerless, they remember that too. It sows gratitude. It sows trust. Generations from now your sacrifice will lead to the peace, prosperity, and fellow feeling among all humanity.”

The air was gone. He couldn’t catch his breath. His mind rejected everything he’d heard. He was going to see Natalia again. He was going to hold the monster in his arms and hear her gabble on about school and the dream she’d had and whether they could get a pet for their apartment. All of that was still true. It couldn’t have changed. Not so quickly. Not so finally.

“Plus, it’ll put Governor Song on notice,” Overstreet said. He stood. “I’m very sorry about this, but it could be worse. You could be going to the Pen.”

He lifted the gun.

“Wait!” Singh said. “Wait. Do you believe all that? About what killing me is supposed to achieve?”

“I am an officer of the Laconian Empire, Governor Singh. I believe what I’m told to believe.”

Chapter Fifty-One: Drummer

It was three months before the *Heart of the Tempest* came to the transfer station at Lagrange-5. People's Home arrived behind it, like a servant waiting for the right moment to bow.

In those long, surreal weeks, the system had changed past all recognition. Or at least it had for Drummer. The surrender of the union ships had let the EMC fleet follow suit. There were some signs that the *Tempest* had suffered from the pounding it had taken—fluctuations of its heat signature, a reluctance to turn to port, the decision not to burn at more than about a fifth of a g. It didn't matter. If Laconia was bloodied, it was unbowed. Drummer couldn't say as much for herself.

A new armada of ships that had followed the *Typhoon* to Medina paused there for less than a day before they burned through the Sol gate. They were smaller ships, of a more familiar design, and fewer than a dozen of them dominated the solar system. The newsfeeds had nothing but the names of the new Laconian *Protector*-class destroyers—*Daskell*, *Ackermann*, *Ekandjo*, *Smith*—and their locations in the system. Where they were and where they might go.

Ganymede and Iapetus, inspired by God knew what quixotic impulse, declared that whatever the union and the EMC had said, they hadn't surrendered. Two of the new ships had gone to each station, and the defiant announcements had ended quickly after that. The independent feeds that called out against Laconia grew fewer and more tentative. Ceres Station had a welcoming committee when the *Ekandjo* docked there, and pictures of the governor of Ceres shaking the hand of the Laconian captain became the iconic image of the moment. Of the capitulation. Two smiling men. The end of one age, the beginning of something new.

The ship that came to escort People's Home was named the *Stover*, and by *escort*, they meant *occupy*.

By then, People's Home had gathered back most of the citizens who'd

fled before the battle. Not all, of course. Some of the evacuation ships scattered themselves out among the smaller settlements and asteroids. Got quiet in hopes that with just a dozen ships, Laconia would overlook them. Maybe it even worked. For those who came back to the void city, Captain Rowman Perkins became their new leader. He was an older Martian man with close-cut white hair and skin the color of stained oak, with a folksy Mariner Valley drawl, kind eyes, and a fire team of Marines in power armor ready to make his wishes into law. When he'd come to her office, he'd had the courtesy to sit in the chair on the opposite side of the desk while they spoke. It was a small politeness that nailed in as much as anything had how utterly defeated she was. Laconia wasn't here to bully her or belittle her. It made no difference to Perkins whether he lost face before her. He'd come to take what he wanted—what he wanted was absolute authority—and he was going to get it. Gently was fine. Less gently was fine as well. The illusion of choice was hers.

She'd chosen.

House arrest was better than being in the brig. Her couch, her clothes, her files and access, though without any broadcast privileges and a Laconian censor looking over her data streams. She dreaded the moment when Saba reached out to her and gave himself away, but that message never came. She assumed that the detention and cooperation of the Transport Union president was useful to Perkins and Trejo and Duarte. Her confinement rooms, her escort to the gym, her meals delivered by Laconian soldiers were all part of the narrative of victory, broadcast through thirteen hundred worlds as a warning to behave well. Before Laconia even the union fell. Even Mars. Even Earth. What hope could any colony world have against them?

That was speculation, of course. Newsfeeds weren't on her diet anymore. But she could watch old movies, listen to music, eat what she wanted, play games, sleep as much as she cared to sleep, exercise her way through all the routines she'd told herself she'd engage with if she ever had the time.

On the best days, house arrest was almost like an enforced vacation. For the first time in her adult life, she had no responsibilities. No long-term political aspirations to cultivate and attend to. No journalists or administrators or officials to spar with. The problems of who passed through which gate, of what artifacts were banned and which were taxed, of

how to balance the needs of the colony worlds, all belonged to someone else now. Except for Saba's absence, it was the life she'd imagined retiring to when her term was complete.

On the worst days, her rooms were a box of crushing depression and failure, and death would be the only release.

Her handlers dealt with all of her moods with the same equanimity and insincere kindness. They were good to her because they chose to be. If they chose otherwise, that would be up to them as well. Her opinions didn't matter unless someone else decided that they did. And she had every reason to believe it was going to be like this—her rooms, the gym, her rooms again, under guard and cut off from humanity—for the rest of her life.

And then, three months after her surrender, the *Heart of the Tempest* came to the transfer station at Lagrange-5, and Drummer went with it.

Vaughn came to her like a ghost from a past life. If she'd needed any measure of how her isolation had affected her, it was how glad she was to see him. His face seemed to have cracked a few new crags down the cheeks and across his forehead. He held himself with the same formality, but instead of radiating his usual low-level contempt, he seemed fragile. Like bread that had been hollowed out inside so that all that remained was the crust.

Or maybe that was her, and she wanted to see how she felt reflected in someone else. To not be so alone with it.

He stood in her doorway while she gathered herself.

"There's a meeting, ma'am," he said. "Admiral Trejo asked me to ... help you prepare."

"Trejo?" she said, and it felt almost like a conversation they would have had before. "Is he here?"

"More that we're there, but yes. The secretary-general, yourself, and Admiral Trejo. A few others. They didn't give me the whole list, but they seem to want you presentable. And there's this."

He held out a hand terminal. She took it, spooled through the file trees it had access to. It was a thin list, but it had the advantage of being new. Things she hadn't already been looking at for weeks had a certain charm. A text file with her name. She opened it.

NOTE TO THE SPEAKER: IT IS IMPORTANT THAT THE SYSTEMS OUTSIDE OF SOL NO LONGER BE REFERRED TO AS "COLONIES." IN THIS AND ANY OFF-THE-CUFF REMARKS, THEY ARE TO BE CALLED "PLANETS" OR "SYSTEMS." NO PRIMACY

SHOULD BE AFFORDED TO EARTH, MARS, OR THE SOL SYSTEM.

QUESTIONER: MONICA STUART

QUESTION: IS THE TRANSPORT UNION COOPERATING IN THE TRANSFER OF CONTROL?

ANSWER: THE TRANSPORT UNION HAS ALWAYS BEEN A TEMPORARY STRUCTURE. BEFORE OUR LACONIAN FRIENDS ARRIVED, WE WERE ALREADY IN TALKS WITH THE UN AND THE EARTH-MARS COALITION TO DRAFT A CHARTER THAT WOULD GIVE OVER GREATER ENFORCEMENT POWERS TO A STANDING MILITARY. THE LACONIAN FLEET IS THE CLEAR CHOICE TO FILL THAT VACUUM, AND THE UNION IS PLEASED TO WORK WITH HIGH CONSUL DUARTE AND PRESIDENT FISK TO SEE THAT TRADE BETWEEN THE PLANETS (SEE NOTE) IS EFFICIENT AND FREE.

QUESTIONER: AUDEN TAMMET

QUESTION: IS THE UNION READY TO PAY REPARATIONS TO LACONIA FOR THE DAMAGE DONE TO ITS SHIPS?

“Press conference, is it?” Drummer asked.

“That appears to be part of the agenda,” Vaughn said. “You may, of course, choose to deviate from the script—”

“May I?”

“—but the Laconian censor will be reviewing everything before it goes out. And there are less pleasant accommodations than this.”

Drummer spooled through the script. Three pages of questions, all of them staged, written, and approved. “So you’re saying I should do this?”

“You gain nothing by refusing. And there is a certain dignity in living to fight another day.”

“Or just living,” Drummer said.

“Or that.”

Drummer sighed. “I suppose I should make myself presentable. How much time do I have?”

The conference room was the same one she’d been in when TSL-5 had opened for business. The vaulted ceiling seemed grander now than it had. The wait staff circulated with flutes of champagne and hors d’oeuvres—tank-grown shrimp, real cheddar, dates wrapped in bacon that had once

actually been a pig. The wall screens with their views of Earth and Luna, People's Home and the *Tempest*, were crisp and beautiful. High-level officials mingled and chatted as if the system of humanity hadn't been turned on its ear. As if history were what it had always been. The absence of a few—Emily Santos-Baca, for instance—was something only she seemed to notice.

The secretary-general was in a pale suit with a collarless shirt and a golden pin in his lapel. He was smiling and shaking hands with the people around him. She'd expected him to be more somber, but in fairness, the transfer station had always been something of a humiliation for him. A place in the universe that defined the limits of his authority. Before, it had been her on the other side of that membrane. Now it was Laconia. So in a way, he'd already had more of a chance to get used to this.

The man he was laughing with, hand on his shoulder, was unmistakable. Admiral Trejo was smaller than she'd expected. Thicker about the chest and belly in a way that didn't speak as much to muscle or fat as genetics and age. His hair was thinning, and not styled to disguise the fact. His eyes were a bright green that would have seemed affected if they'd been fake.

Trejo noticed her, broke off his conversation with the secretary-general, and trundled over toward her. He was just the slightest bit bowlegged. Drummer felt an irrational twitch of betrayal. The man who'd destroyed and humiliated her should at least have been a bronzed Adonis, not a normal human being. It would have made it easier to swallow if she'd been beaten by a god.

"President Drummer," he said, putting out his hand. "I'm glad we could finally meet in more settled circumstances."

"Just Drummer," she said, and found herself shaking his hand. "I think we can dispense with the 'president' part."

"Oh, I hope not," Trejo said. "Transitions like this are delicate times. And the more profound the changes that are coming, the more important that it appear to have continuity. Don't you think?"

"If you say so," she said.

A waiter slid by, and she took a glass. She didn't need the alcohol as much as the idea of it. But, Lord, she needed something.

"I'm sorry your husband couldn't be here," Trejo said. There was nothing in his voice that couldn't just be a pleasantry, except that Saba's name had been linked to the embarrassment on Medina. She'd heard that

much before her detainment. She felt a thrill of fear now. Did Trejo know something? Was he about to tell her Saba had been caught? Been killed?

"I'm sorry too," she said. "I miss him very much. But we have always had different careers."

"I hope to meet him one day," Trejo said, and she relaxed a notch. He wasn't dead. Trejo saw her response and smiled a soft, rueful smile. "It would be useful, I think, if you could help to resolve things with him. Chaos is bad for everyone."

"I don't have any way to reach him," Drummer said. She didn't go on with *And I don't know what I'd tell him if I did*.

"Fair enough," Trejo said. "We'll have that conversation another time, yes? Right now, there's something else I wanted to speak with you about. High Consul Duarte wants to convene the important people in humanity's new endeavors on Laconia. A kind of permanent convocation of the best minds and most influential people. He's asked me to extend an invitation to you."

The politeness of it was foul. The pretense that she was still autonomous, the master of her own fate. Oh, she could probably refuse. Duarte seemed smart enough not to welcome people into his projects who were willing to openly oppose him. But there would be consequences. That they weren't even spelled out made them more ominous.

"This is like the colonies, isn't it?" she said.

Trejo lifted his eyebrows, answering her question with a wordless one of his own.

"You're shifting everything to Laconia," she said. "Not just ships or money. The culture."

Trejo smiled. "Earth will always be the home from which humanity sprang, but yes. The high consul thinks that ... fetishizing Earth is bad for the long-term future of the species. We will also put in place an accelerated repopulation scheme. Try to adjust the balance so that Sol system isn't such an overwhelming majority of the population either."

"You can't put billions of people through the ring gates," Drummer said. "It won't work."

"Not in our lifetimes," Trejo said. "We're talking about the work of generations. But ... well, I was Martian before I was Laconian. Thinking for the long term doesn't intimidate me."

A woman in a white dress with gold at her throat and wrists sloped by,

nodding to Trejo as she passed. He smiled back, glanced at her ass, and then back so quickly it might have passed for politeness.

“Your terraforming plan didn’t work out too well,” Drummer said more acidly than she should have. It just came out that way.

“It would have,” Trejo said, “if something bigger hadn’t come along. Anyway, please do consider the invitation. The high consul is looking forward to meeting you.”

Trejo put a hand on her arm like they were old friends and made his way back out to some other conversation on his list. All around her, the eyes and attention of the crowd followed him and left her behind. She drank her champagne in a gulp and started looking for someplace to ditch the glass so she could get another one.

“Getting drunk, Camina? You think that’s smart, or are you just past giving a fuck anymore?”

Avasarala was in her wheelchair. Her snow-white hair was pulled back in a bun, and her sari was a shimmer of green that almost hid the thinness of her body. She looked older than the last time Drummer had seen her. And she’d looked older than dirt then.

“I am taking the edge off the pain,” Drummer said. “Because what else can I do?”

Avasarala turned her chair and started off toward the podium and the seats. They were empty now, but the journalists were starting to filter in. The show would be starting soon.

“I’d join you, but they tell me I’m on my last liver these days,” Avasarala said. “No more liquor for me.”

“You seem to be taking the conquest fairly well.”

“The fuck option do I have?” Avasarala said. “I’m an old lady who spent her life trying to make peace between Earth and Mars. All this shit? It’s like I missed a day at school, and everyone else learned to speak Mandarin while I was gone. I don’t understand any of this.”

“Yeah,” Drummer said. “I can see that.”

“It’s the reward of old age,” Avasarala said. “You live long enough, and you can watch everything you worked for become irrelevant.”

“You’re not selling it,” Drummer said.

“Fuck you, then. Die young. See if I care.”

Drummer laughed. Avasarala grinned, and for a moment, they understood each other perfectly. For a moment, Drummer didn’t feel alone.

“Are you going to his orgy pit or whatever the fuck it is Duarte’s setting up?” Avasarala asked.

Across the room, Vaughn caught Drummer’s eyes and began walking toward the two women with purpose. Drummer didn’t want to go with him. Didn’t want to face the theater and falsehood of the next part. She turned back to Avasarala.

“I don’t know. I suppose I have to.”

“Always a bad idea to ditch the emperor,” Avasarala agreed. Then, “Do you know why they’re looking for Okoye?”

“Who?”

“Elvi Okoye,” Avasarala said, and Vaughn reached them.

“It’s time, ma’am,” he said.

Drummer nodded and handed him her glass. Avasarala’s claw of a hand grabbed hers, held her for a moment. “Chin up, Camina. These fuckers can smell blood. And this shit’s not over, no matter what it looks like now.”

“Thank you,” Drummer said, and pulled away.

The seats for the journalists were full now. She recognized their faces. Sometimes even the way they sat, the way they moved. She’d done this for years. She’d never done this before.

Admiral Trejo made some brief opening remarks—thanked everyone for being there, expressed bright hopes for the future, extended the greeting of High Consul Duarte—and brought her up. The others would come later. The secretary-general. The speaker of the Martian parliament. Whoever else. But she was the last president of the Transport Union. Her dignity was first for the chopping block.

She looked out over the faces and remembered a time she’d enjoyed this.

“President Drummer?” Her podium identified the woman. Monica Stuart. “Is the Transport Union cooperating in the transfer of control?”

No, it is not. No, I am not. No, we have been conquered, but we will fight to the last breath because living with someone else’s hand on our necks is intolerable, has always been intolerable, will always be intolerable. Not because of Laconia, not because of the union, not because of any of the authorities through all of history that have made rules and then dared people to break them. Because we’re human, and humans are mean, independent monkeys that reached their greatness by killing every other species of hominid that looked at us funny. We will not be controlled for

long. Not even by ourselves. Any other plan is a pipe dream.

In the front row, Avasarala coughed.

Drummer smiled thinly.

“The Transport Union has always been a temporary structure,” she began.

Chapter Fifty-Two: Naomi

Freehold was pain. Some days that was a good thing. It gave her something to push against, something to fight. Other days it was just wearying.

The pencil-thin valley where they'd set the *Roci* down had steep, high mountains to the north, east, and southwest. A thin creek ran along the bottom with glacier meltwater. Pale-green treelike organisms clung to the stone with finger-thick roots and stretched out vines studded with pale-green bladders that floated into the open air as if Nature itself were putting up balloons for a party. A high breeze would shift the vines one way and then the other. Every now and then, one would break off and swirl away down the valley, maybe to die or maybe to find some new place to take root.

She understood it was all the product of evolutionary arms races. Photosynthesizing structures had spent centuries, maybe millennia, trying to choke each other in darkness until one of them had figured out how to both be rooted and fly, how to both command the high air and drop everything below it into permanent twilight. None of it had been created with the *Rocinante* in mind. It just worked out well.

The *Roci* itself huddled in a wide space where the creek curved around. The landing thrusters had scorched the landscape around it, but it didn't take more than a day or two before the local plants began growing back. The fight for survival made everything either resilient or forgotten. The floating vines made a moving canopy fifteen meters above them that would help hide them from observation, if anything ever came into the system to look. As hiding places went, it was decent.

The colony itself—the only other three hundred people on the planet—was in an arid biome a six-hour hike down the valley. At least it was for her. The locals could make the trip in half the time. Houston lived down there, among his people, and sometimes she and Alex would stay there too. But

most days, she was at the *Roci*—her real home. There was maintenance to be done, restocking. Distilling the creek water until it was pure enough to put in the *Roci*'s tanks. The reactor could run for months without needing more fuel, but reaction mass was always a problem. If they wanted to go anywhere. If they just stayed put ... well, less of an issue, then.

Today she'd spent half the daylight hours discouraging a cluster of very slow animals or possibly semimobile plants that were exploring whether the niches around the *Roci*'s PDCs would be a good place to live. When the light faded, she stopped for lunch. The planet's sixteen-hours-and-change diurnal cycle meant that most of her workdays had at least half a night in them.

The *Roci* had been built to rest on its belly in a gravity well. All of her systems functioned, even at ninety degrees from what she'd become used to. That seemed right too. Being at home, but also in a space her body didn't understand. Being in control of her day, but not of her life. Being achingly alone, but not wanting people around. It was all of a piece. If she'd dreamed it, it would have meant something.

As soon as she crawled back into the ship, she showered. There were compounds in the life cycle of Freehold that irritated her skin if she didn't wash them off. Then she pulled on a fresh jumpsuit, went to the galley, made herself a bowl of white kibble, and sat. A message was waiting for her from Bobbie, and she set her hand terminal on the table when she played it so she could use both hands to eat. The kibble was warm and peppery; the mushroom squeaked against her teeth just the way it was supposed to.

Bobbie looked exhausted and excited at the same time. Her hair was pulled back into a tight ponytail the way she wore it when she was working on machinery, not the bun she had for workouts. Her eyes were bright and the suggestion of a smile teased her mouth without ever quite appearing. She looked ten years younger. More than that, she looked happy.

"Hey, Naomi. Hope things are going well down there. I think we're making some real progress up here. I'm not positive, but I think I've found how the *Storm* manages its energy profiles. It's a little screwy, same as everything on this rig. I was wondering if I could get you to take a quick skim through the new dataset I pulled. Maybe you'll see something I didn't?"

The embedded data was structured as environmental-control buffers, and

it was half again the size of the *Roci*'s. Naomi popped it open and glanced at the gross index. A lot of familiar parts, yes, but some strangeness in the large-scale structure. If it was anything like the other bits of the *Gathering Storm*'s operating code they'd harvested for analysis, it would get weirder the deeper in she went. She dropped it to a secure partition in the *Roci* and started unpacking it with her favorite tools, converting the language of the ships into something with handholds that her mind could brace on.

She set her hand terminal to Record. "Dataset received and in process. It may take me a day or two, but I'll let you know what I think. In the meantime, all is well down here. No need for rescue."

It was the rule. Somewhere in the message she sent up the well, there was always the word *rescue* and always would be until she needed one. Bobbie's word was *progress*. A message went back and forth every twenty-four hours at a minimum. Not that there was any real risk that Naomi could see, but protocol was protocol. The locals on Freehold had been at least willing to listen when they'd arrived with Payne Houston in tow, and there had been nothing but cautious goodwill since. Not that Naomi trusted that to last. The colony of Freehold would support her in her guise as a refugee and freedom fighter as long as it was convenient for them. She understood that having the only gunship in the system and a ring gate far enough away that she'd have a free hand how to use it for weeks before help could arrive figured into the local council's calculus of the situation.

Bobbie's improvised crew of Belters were with her on a little moon circling one of Freehold's three gas giants, tucked in an ancient lava tube and showing no signs of mutiny. Bobbie as captain and Amos as acting XO would, Naomi thought, be more than enough to ensure discipline. It also gave Freehold another reason to play nice, and a spare set of eyes on the ring gate in case anything nasty came through.

The *Storm* was slow to give up its secrets, not because of the internal security—though that was an issue—as much as the profound unfamiliarity of some of its technology. Its reliance on calcium, for instance, was an order of magnitude more than Naomi had ever seen, and the vacuum channels it used instead of wiring still made her head ache a little if she thought about them too much. With enough time, though, she was certain they'd come to understand the ship. On her good days, she thought they'd be ready, even if she wasn't sure yet what they were getting ready for.

While the *Roci* arranged the data for her and the kibble broke down

pleasantly in her stomach, she lay back and let her eyes close for a few minutes. Her knees ached. Her spine ached. It wasn't even the gravity of Freehold. This world was smaller than Mars, and only a little bit denser. She'd been on long burns worse than this. Part of the problem was that she wasn't doing her exercises. She was doing work, and there turned out to be a suite of small, neglected muscles that had atrophied over the years and weren't happy to be put into service clearing vegetation and crawling around the bottom of a gravity well.

There was also, she suspected, something of a placebo effect. She'd spent so many years equating life in free atmosphere on a planetary surface with a constant, grinding full g, that now even though the gravity was actually fairly mild, she was primed to notice the discomfort. She expected it, and so it was there.

The *Rocinante* chimed to announce the completion of the data run, and then again almost immediately to announce Alex's return. It was less than a minute before she heard him walking up the hallway that was usually the lift tube. He was singing to himself. A light, lilting melody with words she didn't recognize.

"In here," she called as he came close.

Alex poked his head into the galley. He was more comfortable going into town, and the combination of long walks and sunlight had darkened his skin and given him his cheekbones back.

"Hola," he said. "Good news from Freehold. We're a business!"

He lifted his right arm. The satchel in it was heavy with batteries ready to be recharged. It was a minor convenience for the township to have Alex come by and collect batteries, recharge them from the *Roci's* reactor, and deliver them again full up instead of waiting for their turn at the solar array. So Freehold's poor foresight on solar energy was now their cottage industry. At least for now.

Alex's grin widened. "And ..."

"And?"

He lifted his left hand. A second satchel. "They paid in beer and curried goat. I've got a little cook fire started outside. It's going to be great."

Naomi started to say that she'd just eaten, but the joy in Alex's eyes was infectious. She swung herself up to sitting. "On my way," she said.

The moons weren't shining in the valley when she reached the airlock, but Alex's little cook fire was glowing happily next to the landing strut, and

the stars glittered between the floating vines above them. They burned dried-out vines and the shed carapaces of huge, slow-moving animals that lived in shallow caves all up and down the valley. The smoke was pale and fragrant. The shards of carapace popped and cracked now and then, sending little sprays of spark up with the smoke to vanish as they cooled. The smoke kept away the night hoppers—tiny, nocturnal insect-like animals that usually found humans fascinating.

Alex had two skewers of meat dripping grease and curry onto the flames, and Naomi had to admit that they smelled better than kibble. She sat with her back against the landing strut. Alex took a bottle from his satchel, opened its neck, and passed it over. The beer was cold and rich and more biting than she'd expected.

"Robust," she said.

"Danielle likes a higher proof than some brewers," Alex said with a smile as he leaned back to look at the vines and the sky beyond them.

"Seems like you're getting along well with the locals."

"They're all right," Alex said. "Just don't get them talking about the nature of sovereignty and you're fine. Even then you're all right, it's just a conversation they've all had a lot. Tends to go along the ground they've already plowed."

He reached over and turned the skewers. High above them, something set off one of the vine bladders, and it glowed a pale yellow-green for a moment, then went dark again.

"Good to build rapport," Naomi said. "Freehold's going to have to look like a polite, compliant little colony for a while."

"No trouble. The council's on board for an 'enemy-of-my-enemy, hail Laconia, down with the union' stance. For the time being anyway. I think they kind of like having us here, actually. The founding impulse of Freehold is sticking it to the government."

"Loses some of its shine after you get elected."

"Right?" Alex tested the curried meat with his finger, pinching and releasing fast enough that he didn't get burned. He handed it over to Naomi. She waved it in the night air for a moment to let it cool, then took the first cube off the end and popped it in her mouth. The char on the meat was good. The spices that infused it were better. She chewed slowly, letting herself enjoy it.

"Do you think they'll sell us out?"

“Eventually, sure,” Alex said cheerfully. “But not right away. And probably not for cheap, so long as they like us.”

Her plan was the long one. The only one, really, that made sense. Laconia’s strength seemed overwhelming. A force without weakness that nothing could ever overcome. That was an illusion. Earth had seemed like that once, when she’d been a girl scraping together a life in the Belt. It hadn’t been true then either.

They’d wait. They’d watch. They’d be small and quiet and aware. Sooner or later, Laconia would show them where it was weak. And between then and now, life. Charging batteries in exchange for beer. Making friends with the township. Working to crack open the mysteries of the *Gathering Storm* with Bobbie and Amos. Keeping the *Rocinante* in good trim, and keeping herself from falling into despair. It was enough to fill her days. It would have to be enough.

“Which one of those is Bobbie?” Alex asked.

“Hmm?”

With the second skewer, he pointed up at the night sky peeping through from behind the vines. “One of those stars isn’t a star, right? I mean, we can see her from here, can’t we?”

Naomi looked up at the little slice of stars. The galactic disk looked the same as it had in Sol system, but the constellations not quite like her own. Parallax, she knew, was how they’d started mapping which systems were on the other sides of the gates. She’d seen a map once—the splash of systems that the gates connected. Thirteen hundred stars in a galaxy with three hundred billion of them. They’d been clumped together, the gate-network stars. The two farthest systems were hardly more than a thousand light-years apart. A little more than one percent of the galaxy, and still unthinkably vast.

“Look just above the ridge there,” she said, pointing. “You see where the rock looks like a bent finger? The round knuckle?”

“Yeah, I see it.”

“Track just up from that, and to the right. There are three stars almost in a row. The middle one is Bobbie.”

“Hmm,” Alex said, then went quiet. He wasn’t singing anymore, but sometimes Naomi thought she heard a few hummed notes under his breath. It was maybe five minutes before he spoke again. “I wonder which one’s Mars.”

“Sol system?” she said. “I don’t know.”

“I think about Kit,” Alex said and took another drink of his beer. “And Giselle, I guess, but more about Kit. I have a son out there. He’s just starting his own life. His adulthood. I won’t be there for it. I don’t even know that I’d be any use if I were. I mean, when I was his age, I was getting into the navy, and Earth and Mars were the biggest things in the universe. Now ... I don’t know. Everything’s different. He has to find his own way.”

“That’s always how it is,” Naomi said.

“I know. Every kid has to find who they are without Mom and Dad, but —”

“History too. Mars before Solomon Epstein. Earth before the seas came up. Before there were airplanes and then after. When we figured out how to grow our own food. Everything’s always changed.”

“But up to now it wasn’t my problem,” Alex said, with an affected disconsolate buzz in his voice. They both laughed together. A half dozen of the vine bladders lit up and faded. She didn’t know what made them do that, but it was pretty. She felt a pleasant warmth growing in her belly. The beer, probably. Or the meat, since she’d eaten almost all of it despite her expectations. Or the sense of being in midnight under stars in the middle of an ocean of air that wouldn’t run out or leak away. It really was reassuring in a way that even the best station atmosphere could never quite equal.

“I think about Jim the same way,” she said. “Not that he’s beginning his adulthood, but he always wanted to take me back to Earth. To show me what living on a planet was like. Now I’m here, and I’m finding out, and he’s not.”

“He’ll be all right,” Alex said. “He always is.”

“I know,” she said aloud, but they both knew she meant *Maybe*.

Something crashed through the underbrush, made a high keening sound, and crashed away. They’d heard it before often enough that they both ignored it. Alex finished off the last of his beer and tucked the empty bottle back in his satchel. He levered himself up to standing and stretched his arms above him, looking like some ancient priest in the firelight.

“I should get these things hooked up,” he said, hefting the dead batteries. “I said I’d have them back tomorrow. I’ll probably take a sleep shift in town after that, if you’re all right solo?”

“That’s fine,” she said. “Bobbie sent me a new dataset. I’ll be working on that. I wouldn’t be much company anyway.”

“Should I douse the fire?”

Naomi shook her head. “I’ll do it when I go in. I think I overate. I need to just sit for a little while.”

“Right,” Alex said, and trudged over to the airlock. He lifted himself in, and she heard him starting to sing again until the door closed behind him. She lay back.

Everything changed, and it went right on changing. A terrible thought when things were good, a comforting one now. Whatever happened, she could be certain that things wouldn’t stay the way they were now. And if she stayed smart and clever and lucky, she’d be able to affect how the next change came. Or take advantage of it. She’d find Jim again, if she could just be patient enough.

One of the vines broke loose from the mountain wall and drifted along with some high breeze that she didn’t feel. She watched it blunder away to the southwest, catching on another vine for a moment, then losing its grip and floating on. Where it had been, there was a new spray of stars now, glittering from decades and centuries ago, their light only happening to fall on her here and now.

She wondered if one of them was Laconia.

OceanofPDF.com

Epilogue: Duarte

Winston Duarte watched his daughter playing at the fountain's edge. Teresa was ten now, and almost as tall as her mother had been. She was working with a clay boat, discovering the relationship between buoyancy and displacement for herself. Forming and re-forming the little craft of her own design. Finding not only what was the most efficient but also what was the most aesthetically pleasing. What would float and also steer and also be beautiful in its own right. Her tutor, Colonel Ilich, sat on the edge of the fountain as well, talking with her. Guiding her thoughts through the process, and helping her to connect the work of her hands to the lessons in mathematics and history and art.

He didn't know whether she was aware how lonesome a childhood she'd had. The State Building had facilities for the children of the government to live and work and attend lessons while their parents saw to the mechanisms of the empire, but most of the classrooms—like the offices—were empty. Prepared for a generation that was still just beginning. The timing was wrong for Teresa. Someday children would run and play together in the streets and parks of Laconia, but by then Teresa would be grown.

She leaned forward, lowered her latest design into the water. Ilich asked her something, and she replied. Duarte couldn't hear what they were saying from this distance, but he saw the change in the way she held the little boat. And more than that, he saw her mind change.

That had started more recently, and he wasn't certain what to make of it yet. A pattern of something around her head when she was thinking strongly. As she worked the clay, it infused her hands as well. Ilich had it too, though not as intensely. Of all the ways his changes affected his senses, this new one was the most interesting. He had the suspicion that he was, in some sense, seeing *thought*.

Teresa glanced over, and the whatever-it-was shifted just before she raised her hand. He waved back, returning her smile, then stepped away

into the State Building to let her continue her studies undistracted. He loved his daughter profoundly, and the joy of watching her learn was better than anything else he had scheduled, but his presence wouldn't help her or the empire. Duty called.

He found Kelly waiting for him in his private office. The look on the man's face was enough to tell him that they had arrived. His heart sank. He had been dreading this moment since he'd heard that Natalia Singh had requested the personal meeting. It was her right, though. And his obligation.

"They're in the east drawing room, sir."

"They?"

"She brought her daughter."

Another little punch to the gut. But ... "All right. Thank you, Kelly."

Natalia and Elsa Singh were dressed in matching clothes. Dark blue with white accents. Not the full black of mourning, but somber. He sat across from them as Kelly served tea and cakes. Duarte felt the temptation to focus on the whatever-it-was, to see if grief and anger looked different from Teresa's lesson with the clay boats, but it seemed impolite, so he didn't.

Kelly closed the door behind him as he left. Duarte sipped his tea. Natalia Singh didn't touch hers, but the little girl ate some cake. The sweetness of sugar overcame everything for children. Even loss. There was something profound in that. Beautiful and sad both.

"Doctor Singh," Duarte said. "I am so sorry for your loss."

Her chin lifted a few degrees, proud and defiant. He hoped she wasn't going to do anything stupid. Grief was a terrible thing.

"Thank you, sir," she said through a tight throat. The little one looked over, confused less by the words than by her mother's tone of voice. Elsa was a smart child, he could see that. Empathetic, which was more important really than other kinds of intelligence. She shifted on the couch, scooted toward her mother.

Duarte leaned forward, putting down his teacup. He laced his fingers together, and when he spoke, he tried to put as much warmth and care into his voice as the little girl had expressed in her movement.

"You asked to speak with me. How can I help you?"

"I would like to request a copy of the formal inquiry into my husband's death," she said, then swallowed.

Duarte slipped. His focus shifted, and the whatever-it-was—thought, consciousness, attention—became clear to him for a moment. It was tight in

around Natalia Singh's head and chest, wrapping her like a shroud. The little one—Elsa—hers was diffused around her, thicker toward her mother, like something physical in her was reaching out. Longing to comfort and be comforted in a field effect that was something more, apparently, than just metaphor. He pulled his attention back to his more usual senses with a little echo of shame, as if he'd eavesdropped on something.

"Of course," he said. "I'll see that it's delivered to you."

Natalia Singh nodded once and wiped a tear away like it was an insect that had landed on her cheek.

"He was a good man," Duarte said. "I know that. You know that. In another time and another place, he would have been celebrated."

"He wasn't a killer," she said, and her voice had pressed down to a whisper.

"He was put into an extreme position, and he overreacted," Duarte said. "Our place in humanity is special. The rules that apply to us are harsh. You and me and him. But there's a reason for that, and I want you to know how much I honor his sacrifice. And yours. Both of yours."

Elsa looked at him now as if she knew he was talking about her. He smiled at the girl, and after a moment, she smiled back. He could see an echo of her mother's face in her small, soft features. Her father's too. He took Natalia's hand, and she didn't pull away.

"You will have the full support of the government," he said, "if you want it. Your daughter has a guaranteed place in the academy. Your work is important to us. To me. I know this is hard, and you have my word that you will not face this alone. We're all with you, whatever you need."

She nodded more slowly this time. She didn't wipe the tears away. Her daughter climbed into her lap, and Natalia put her free arm around her, rocked her slowly back and forth. It was heartbreaking, but he'd made the decision. He wouldn't look away from the consequences of it. This was his duty too.

"Is there anything else I can do for you?"

She shook her head. Speech was beyond her. While she wept, he poured her more tea, and sat, witnessing her sorrow and being present with her and her child. After a few minutes, she looked up at him, her eyes clearer, calmer. He took a deep breath, squeezed her hand gently, and released it.

"Thank you," Natalia said.

He made a little bow to her, a last gesture of respect, and withdrew.

Anytime a Laconian died in the service of the empire, their family had the right to a private audience with the high consul. It was a tradition he'd begun when they first passed through the gate. It would have to be reconsidered as the empire expanded, but for now, it was still in his power to honor it, so he did.

Kelly was waiting for him in his office, a look of sympathy in his eyes. He didn't mention the widow or her daughter in the drawing room. Kelly was a man of perfect tact.

"A report from Doctor Cortázar, sir," he said.

Duarte pulled up the new file, opening it with a gesture. Cumulative update on the debriefing of Prisoner 17. Duarte spooled down the file, seeing Cortázar's questions, the prisoner's responses. They were only words. Designs of light drawn on air. After glimpsing the living thoughts of Dr. Singh and her daughter, mere language seemed sterile. He looked at Kelly, closed the file.

"I think," Duarte said, "it may be time I met this Captain Holden."

The man sat on the floor, his back to the wall of the cell. His splayed legs and bright eyes made him seem younger than his graying hair. As Duarte came in, Holden's gaze shifted between him and his guard—back and forth—until it settled on him. Duarte sat on the bunk, hands on his thighs, and looked down at the man who had caused so much trouble over so many years. He didn't look like anything more than an old ice bucket with a little too much curiosity and too little impulse control.

Duarte had known people like him from his time in the service. Hotheads and gadflies. The ones who were always sure they knew better than anyone else. The truth was, they had their place. Like anyone else, they could be apt tools if they were well suited to the task at hand.

Here he had no qualms about using his new senses. Holden was an enemy and an asset. He had no right to any privacy. And the pattern mind was ... fascinating.

When he'd been a boy, Duarte had seen an optical illusion that changed one face into another as the viewer came near it. Holden was like that. There was something about the way the pattern of his thoughts moved that

reminded him of dry riverbeds. The traces of something that had been there and was now gone, but not without leaving the trail of its passage behind it. Patterns inside patterns.

“You’re Winston Duarte,” Holden said, snapping Duarte’s attention back to his more usual ways of seeing.

“Yes,” Duarte said. “I am.”

Holden pulled his knees up, rested his arms on them. His eyes were wide, and even a little bit frightened. “What the fuck happened to you?”

It took Duarte a moment to understand, then he chuckled. “Yes. I forget. I’ve been through some changes. Not everyone notices, but there have been some ... I don’t know. Shifts?”

“You’re using that shit on *yourself*?”

“I think we’re getting off on the wrong foot, Captain. Let me try this again. I’m High Consul Duarte. You and I have a shared interest, I understand, in the origins and function of the protomolecule. Did I get that right?”

“You have to listen to me. I saw what happened to them. To the things that made the protomolecule. There was a record on the ring station from before they got shut down.”

“I read the report on that,” Duarte said. “Even before I came here. It was part of what inspired me to take the steps I’ve taken. Not just”—he gestured at his own body—“but all of it. An empire is a tool, just like everything else.”

That brought Holden to a stop. The pattern around his head was shifting and vibrating like a hive of angry wasps. Again, he had the sense of seeing the remnants of something in Holden’s mind. Traces of another pattern. There was a term for this, but ...

“*Palimpsest*,” Duarte said aloud, then shook his head when Holden frowned. “I was trying to remember a word. I just got it. *Palimpsest*.”

“You came here because of the thing that killed the protomolecule?”

Duarte leaned back, considered James Holden and, now that he’d met him, how best to build rapport. Radical honesty for radical honesty, maybe? Worth trying.

“I was connected to the MCRN intelligence services when the gate opened. The first one. Sol gate. And when the other gates opened, I saw the probe data sets as they came in. The early surveys of all the systems as fast as we could get them. And I saw an opportunity here. The most clearly

intact ruins. A set of orbiting structures with what appeared to be a ship or something like it halfway through being constructed. And I recognized that the protomolecule had the potential to act as a handle of sorts. A way to interact with the artifacts that had been left behind. So I got the sample that we still had, and the best minds I could find on the subject. And through discipline and commitment, we developed new technologies faster and better than all the other worlds put together. Laconia is Mars. The Martian ideal taken to the next level.”

“That’s all great,” Holden said. “Except for the part where something came and killed the shit out of all the things that made the artifacts. I saw whole systems going dark. They shut down the gates just to try to stop whatever was killing them, and it didn’t work.”

“I know.”

“That thing that popped up on your ship? That’s the same thing that killed the protomolecule. That wiped out the civilization that built all of this.”

“I know that too,” Duarte said. “Or I guessed, anyway. It seems the most promising hypothesis. And it’s related, I believe, to the missing ships. Something deep, something *profound*, doesn’t like anyone using these technologies and powers. Didn’t like when the last ones did it, don’t like it now that we’ve turned them back on. It’s an interesting problem.”

Holden stood up. The guard stepped forward, but Duarte gestured for him to stay back.

“Interesting problem? Something fired a shot at you. At your ship. It turned off people’s minds all throughout the system, and that’s an interesting problem? That was an *attack*.”

“And it didn’t work,” Duarte said. “We aren’t the same thing that got wiped out before. What killed them affected us, but it didn’t destroy us.”

“You seem pretty sure it’s not going to find some slightly different approach that’s going to wipe us all out. You’re not picking a fight with the things that made the protomolecule. You’re picking a fight with whatever killed *them*. Orders of magnitude above the things that were orders of magnitude above us. You’ve got to know this is going to escalate if we keep using these technologies.”

“We were always going to keep using these technologies. That was inevitable the moment we opened the gates,” Duarte said. “If you’ve studied any history at all, you know that. Never in human history have we

discovered something useful and then chosen not to use it.”

Holden looked around the cell like there might be something there to help him. Duarte didn’t need any new fields of perception to see the agitation in Holden’s mind. Duarte softened his voice the way he had with Natalia and Elsa, offering comfort and consolation in his tone if not his words.

“There was no path where we left the gates alone. No future where we didn’t use the technologies and lessons we learned from them. And there wasn’t likely to be one where we didn’t face the same kind of pushback that killed the ones who came before us. There was only the way forward where we were scattershot and chaotic, or the one where we were organized, regimented, and disciplined. And the missing ships are a promise that the killers in the abyss will come back. That they’ve never really left. You, more than anyone else, should understand that.”

“I did,” Holden said. “I do. It’s why I came here. To warn you.”

Duarte leaned back. The bunk was thin and uncomfortable. He didn’t envy Holden’s having to sleep on it. But there was a breeze through the window and a bit of sunlight. The cell was still more luxurious than half of the ship cabins Duarte had been assigned early in his career.

Holden’s hands were open as if he were offering something. And he was, but it wasn’t what he thought.

“I don’t need a warning,” Duarte said. “I need an ally. You have seen things no one else has ever seen. You know things I need to know, and you might not even be aware of the significance of some of it. Doctor Cortázar has been trying to find that. Help him. Work with him. Work with *me*.”

“To do what?”

“To take the shards of the protomolecule’s broken sword and reforge it. To bring humanity into a single community that is functional and strong. And prepare us.”

Holden laughed, but there was no mirth in it. Duarte knew he hadn’t reached the man. That was disappointing.

“Prepare us for what?” Holden asked. “To poke gods with a sharp stick?”

“No, Captain Holden. No sticks,” Duarte said. “When you fight gods, you storm heaven.”

The story continues in...

Acknowledgments

While the creation of any book is less a solitary act than it seems, the past few years have seen a huge increase in the people involved with *The Expanse* in all its incarnations, including this one. This book would not exist without the hard work and dedication of Danny and Heather Baror, Will Hinton, Tim Holman, Anne Clarke, Ellen Wright, Alex Lencicki, and the whole brilliant crew at Orbit. Special thanks are also due Carrie Vaughn for her services as a beta reader, and the gang from Sakeriver: Tom, Sake Mike, Non-Sake Mike, Jim-me, Porter, Scott, Raja, Jeff, Mark, Dan, Joe, and Erik Slaine, who got the ball rolling.

The support team for *The Expanse* has also grown to include the staff at Alcon Entertainment and Syfy, and the cast and crew of *The Expanse*. Our thanks and gratitude go especially to Matt Rasmussen, Glenton Richards, and Kenn Fisher.

And, as always, none of this would have happened without the support and company of Jayné, Kat, and Scarlet.

ANNEX

The Violet Wars

by

Rich Larson

*In Rich Larson's astonishing debut **Annex**, only outsiders can fight off the true aliens.*

At first it is a nightmare. When the invaders arrive, the world as they know it is destroyed. Their friends are kidnapped. Their families are changed.

Then it is a dream. With no adults left to run things, Violet and the others who have escaped capture are truly free for the first time. They can do whatever they want to do. They can be whoever they want to be.

But the invaders won't leave them alone for long...

This thrilling debut by one of the most acclaimed short-form writers in science fiction tells the story of two young outsiders who must find a way to fight back against the aliens who have taken over her city.

1

The pharmacy's sign was burnt out and the windows all smashed in—Violet had done one herself—but there were still three customers standing gamely in line. She stepped around them, shoes squealing on the broken glass, and headed for the counter. None of the three wasters noticed her butting in. They didn't notice much of anything, not their torn clothes or singed hair or bloody feet. The slick black clamps at the bases of their skulls saw to that. Violet tried not to look too closely at wasters. Peripherals only, was her rule. If she looked too closely, she was liable to see someone she recognized.

Of course, she made an exception for the pharmacist. "Oh, hi!" she said, feigning surprise. "I think you helped me last week, right?"

The pharmacist said nothing, moving his hands in the air a foot over from the register, his glazed-over eyes trained on something that wasn't there. His beard was hugely overgrown, but Violet had sort of a thing for the mountain man look. He was still tall and muscly, though in a wiry way now, because wasters forgot to eat more often than not. Still handsome.

"Well, if I'm an addict, you're my dealer, jerk," Violet said, cocking her hip and trying to flutter her eyelashes without looking like she'd detached a retina. She was getting better at it. Maybe she would try it on Wyatt soon.

The pharmacist said nothing, now pulling imaginary pill bottles out of an empty metal cupboard Violet had already ransacked. His vacant half smile didn't seem as charming today. Violet gave a sour shrug and tossed her duffel bag over the counter, then nimbly followed.

"That's our problem ... Dennis," she said, leaning in to read the red plastic name tag stuck through his shirt. "You're a shitty communicator. We're not going to last."

Violet gave the pharmacist a consoling pat on the arm, then unzipped her duffel and set to work. Wyatt had told her to get antibiotics and painkillers, and since Violet knew her way around from last time, it didn't take her long to fill the bag with Tylenol-4s, ibuprofen, three rattling canisters of Cipro, and a bottle of liquid codeine. Wyatt was strict about who got the medicine

ever since one of the younger Lost Boys made himself sick chugging cough syrup, and he never used it himself, never took a single pill, even though Violet knew the scar along his hips made him wince sometimes.

Violet wasn't interested in painkillers. She had more important drugs to look for. She rifled through the birth control until she found her estradiol—Estrofem this time—then emptied the tablets into her own private ziplock stash. She hunted down more Aldactone to top up her spiro supply.

She shook the plastic baggie, eyeing the candy-shop assortment of pills and counting days, then pincerd a pale green Estrofem and swallowed it dry. Her Parasite rippled in response, whether with pleasure or revulsion, Violet never knew. She folded the baggie carefully into the bottom of her duffel bag with the other meds and dragged the zipper shut.

“Well, I *might* be free for coffee this weekend,” Violet told the pharmacist, slinging the duffel over her bony shoulder. “But I can't give you my number because, you know, an alien invasion fried all the phones. No, I swear to God. Maybe next time, handsome.”

She scooted across the counter and dropped down on the other side, brushing a slice of dark hair out of her face. The wasters ignored her on her way out, all of them still standing patiently in line.

Violet kept them in her peripherals.

2

Bo was hiding behind a powerjack, only meters from the fire door and the emergency exit sign glowing above it through the gloom. The Parasite in his stomach wriggled madly. He held his hand to the icy concrete floor; when the flesh of his palm was stinging cold, he pressed it against his stomach. That helped soothe it a bit.

The electricity had gone out earlier that day, dropping the grimy corridors and sleeping rooms into darkness, and Bo wasn't going to waste his chance. He'd snuck out of his bed while a boy named James was wailing and weeping loud enough to make the whirlybird drift over to him with its sleep-inducing syringe. A few of the other kids had watched Bo slip away, but he'd put a fierce finger to his lips and none of them had seemed particularly interested anyway. Most of them drank the water.

His older sister, Lia, was the one who'd realized that they put something in the water that made you feel dull and happy, and that it was better to collect drips off pipes in the bathroom. She was thirteen to Bo's eleven and she usually did the thinking. But she was gone now.

So Bo had found his way through the dark corridor alone, running one hand along the pitted concrete wall and its retrofitted wires, making his way toward the emergency exit that led outside. Now he was waiting for the last group of kids to go from supper to bed, trying to breathe slowly and keep the Parasite in check.

A familiar whine filled the air, then a whirlybird emerged from the corridor. It was as big around the middle as Bo and drifted along at head height, like a balloon, except made of slick rubbery flesh and gleaming black metal and other things he couldn't guess at. A tangle of spidery multi-jointed arms dangled down from its underbelly, flexing slowly in the air, and there was a bright acid-yellow lantern set into the top of its carapace that illuminated the kids plodding behind it.

As always, Bo scanned their faces. Everyone's eyes were turned to deep dark shadows by the sickly yellow glow, and everyone was stepping slow

and dreamy-like. For a moment he fooled himself into thinking he saw Lia near the back of the file, faking the effects of the water, because there was no way she'd started drinking it, but it was a different black girl. Shorter, and lighter-skinned.

He knew Lia was in some other facility. They'd been split up weeks ago. But it didn't stop him from looking.

The whirlybird floated past and Bo imagined himself springing at it, seizing one of its trailing limbs, smashing it against the floor, and stomping until it cracked open. The Parasite in his stomach stirred at the thought. But his wrists and hands were still crisscrossed with feather-white scars from the first and last time he'd tried that.

Instead, he waited until the glow of the whirlybird receded into the dark and the last of the kids got swallowed up in the shadows.

Bo was alone. His heart hammered his ribs and the Parasite gave another twitch. He levered himself upright, crept out from behind the powerjack. Three surreal strides and he was at the door, hands gripping the bar.

A girl named Ferris had tried to open it before, and the wailing of the alarm had drawn the whirlybirds in an instant. But with the electricity out, there would be no alarm and no fifteen-second delay on the crash bar. Bo still made himself pause to listen, to be sure there wasn't a whirlybird drifting on the other side of the paint-flaking metal. He heard nothing except the toddlers who'd been crying ever since the lights went out. With a tight feeling in his throat, Bo pushed.

The door swung open with a clunk and a screech, and cold clean air rushed into his lungs like the first breath after a storm. He'd been in the chemical-smelling warehouse for so long he'd forgotten how fresh air tasted. Bo gasped at it.

He took a shaky step forward, only just remembering to catch the door before it slammed behind him. He tried to focus. He was in a long narrow alley, garbage whipping around his feet and graffiti marching along the soot-stained walls. Bo knew, dimly, that the warehouses they'd been put in were near the docks. The briny sea-smell confirmed that much. He was far, far from their old neighborhood, and he didn't know if it even existed anymore.

Bo looked up. The dusk sky seemed impossibly wide after months of fluorescent-lit ceilings, but it wasn't empty. Unfurling over the city like an enormous black umbrella, all moving spars and flanges, was the ship. It

didn't look like a spaceship to Bo, not how he'd seen them in movies. It didn't look like it should even be able to fly.

But it drifted there overhead, light as air. Bo remembered it spitting a rain of sizzling blue bombs down on the city, burning the park behind their house to white ash, toppling the skyscrapers downtown. And up there with the ship, wheeling slow circles, Bo saw the mechanical whale-like things that had snatched up him and his sister and all the other kids and taken them to the warehouses. Remembering it put a shock of sweat in his armpits, and his stomach gave a fearful churn. The Parasite churned with it.

Bo started down the alley at a trot before the panic could paralyze him. He didn't know where to go, but he knew he needed to put distance between himself and the warehouse. As much distance as possible. Then he would find somewhere to hide. Find something to eat—real food, not the gray glue they ate in the warehouses. He had been fantasizing about pepperoni pizza lately, or, even better, his mom's cooking, the things she made for special occasions: *shinkafa da wake*, with oily onions and the spicy *yaji* powder that made Lia's eyes water so bad, and fried plantains.

That made him think of his mom again, so he buried the memory, as he had for months now, and picked up his pace to a jog. The Parasite throbbed in his stomach and he felt a static charge under his skin, making the hairs stand up from the nape of his neck. That happened more often lately, and always when Bo was angry or frightened or excited. He imagined himself smashing a whirlybird out of the air right as it went to jab his sister with the syringe, and her thanking him, and admitting that if he had his shoes on he was faster than her now. He pictured himself opening the doors and all the other kids streaming out of the warehouse.

A harsh yellow light froze him to the spot. Shielding his watering eyes, Bo looked up and saw the silhouette of a whale-thing descending through the dark sky. He took an experimental step to the left. The beam of light tracked him. The whale-thing was close enough that he could hear its awful chugging sound, half like an engine, half like a dying animal trying to breathe. Bo was never going inside one again.

He ran.

After four months in the warehouse, four months of plodding slowly behind the whirlybirds because anything quicker than a walk agitated them, Bo felt slow. His breath hitched early behind his chest and he had an unfamiliar ache in his shoulder. But as the whale-thing dropped lower, its

chugging sound loud in his ears, adrenaline plowed through all of that and he found his rhythm, flying across the pavement, pumping hard.

Fastest in his grade, faster than Lia. He said it in his head like a chant. Faster than anybody.

Bo tore down the alley with a wild shout, halfway between a laugh and a scream. His battered Lottos, tread long gone, slapped hard to the ground. He could feel his heart shooting through his throat, and the Parasite was writhing and crackling in his belly. The static again, putting his hair on end. He could feel the huge shape of the whale-thing surging over him. Its acid-yellow light strobed the alley, slapping his shadow on each wall of it, moving its blurry black limbs in sync with his. Bo raced them.

Faster than his own shadow.

He blew out the end of the alley and across the cracked tarmac of a parking lot, seeing the yellow-stenciled lines and trying to take one space with each stride. Impossibly, he could feel the whale-thing falling back, slowing down. Its hot air was no longer pounding on his back. Bo didn't let himself slow down, because Lia said you were always meant to pick a spot beyond the finish line and make that your finish line.

The fence seemed to erupt from nowhere. Bo's eyes widened, but it was too late to stop. He hurtled toward it, more certain with each footfall that he wasn't going to be able to scale it. It wasn't the chain-link that he used to scramble up and down gecko-quick. It wasn't metal at all, more like a woven tangle of vines, or maybe veins, every part of it pulsing. A few of the tendrils stretched out toward him, sensing him. Ready to snatch him and hold him and give him back to the warehouse.

He couldn't stop. The whale-thing was still chugging along behind him, hemming him in. Bo had to get out. Bo had to get out, he had to get help. He had to come back for his sister and for the others, even the ones who cried too much. His throat was clenched around a sob as he hurled himself at the fence, remembering Ferris being dragged away by the whirlybirds. His limbs were shaking; the Parasite was vibrating him, like a battery in his stomach. He squeezed his eyes shut.

There was a shiver, a ripple, a strange pulse that passed through every inch of him, and he didn't feel the fence's tentacles wrapping him tight. He didn't feel anything until he collapsed onto the tarmac on the other side, scraping his left elbow raw. Bo's eyes flew open. He spun around, still on the ground, and stared at the fence. In the dead center of it was a jagged

hole, punched straight through. The fence wriggled around it, fingering the hole like a wound.

Bo clambered to his feet, panting. He wiped the ooze of blood off his elbow, nearly relishing the sting of it—he hadn't been properly scraped up for months. Then he put his hand on his stomach. The static was gone, like it had never been at all, and the Parasite felt suddenly heavy, no longer twitching or moving. Had he done that? Had he made the hole?

The whale-thing was stopped on the other side of it, and it didn't have a face but he got the sense it was as surprised as he was. Bo gave an instinctive glance around for grown-ups, even though he knew he wouldn't see any, then flipped it the bird. The whale-thing didn't respond, still hovering in place. Then a strange moaning noise came from inside of it. Bo watched as the whale-thing's underbelly peeled open. Something slimed and dark started unfolding itself, then dropped to the paving with a thick wet slap. It was human-shaped.

Bo felt a tiny trickle of piss finally squeeze out down his leg. The human shape moaned again, and that was enough to give Bo his second wind. He turned and ran again, the cut on his elbow singing in the cold night air, the Parasite sitting like lead in his gut. But he was out of the warehouse, and he wasn't going to let them take him again, not ever. When he came back, it would be to get Lia, and the others, and to smash every last whirlybird in the place.

It was the only way to be sure he got the one that had pinned him down that first day and injected the Parasite right through his belly button.

Bo made it his new pact as he jogged, deeper and deeper, into the dark and ruined city.

Violet was heading to Safeway to pick up some groceries, walking down a silent street under a cloudy gray sky. Gray as the day the ship came down, scorching the city with the electric blue pulses Wyatt said were exhaust from its engines. There'd been no sun since. Just gray, a hazy emulsion that looked close to rain but never gave it up. Violet didn't mind the new weather. Sun burned her and rain made everything too wet.

She walked down the middle of the street instead of the sidewalk, weaving through the stalled-out cars. Some had wasters sitting inside, imagining themselves driving off to work, but most of the cars didn't work anyway. Their chips were fried. The ones that did work were useless, what

with the roads so clogged and nobody really knowing how to drive besides.

The intersection ahead was stoppered up with the splintered geometry of a crash, a three-car pile-up that had happened during the big panic when the ship came down. Violet didn't want to walk around it, so she clambered up onto the accordion-scrunched hood of an SUV. The soles of her Skechers popped little dents in the aluminum. She tried to ignore the dead-thing smell that wafted from the backseat.

On the other side of the wreck, she faced a corner liquor store, half of it black and crumbled from an electrical fire, and then beyond it her destination: the Safeway where she'd shopped with her mom four months and a lifetime ago. The parking lot was strewn with garbage, picked at by a flock of dirty gulls, and wasters shuffled slowly around it with grocery bags that Violet knew were sometimes full, sometimes empty. Some of them were pushing squeaky shopping carts across the ruptured tarmac.

But one of the carts wasn't being pushed by a waster. Violet narrowed her eyes. It was a boy, maybe ten or eleven, skinny frame swallowed in an oversized hoodie. She watched him roll his sleeves up to his elbows, one of which was swatched with Technicolor Band-Aids, and start wrestling with the cart again. He'd picked one with sticky wheels, but it had alright stuff in it: a sleeping bag, a trussed-up Styrofoam mattress, canned food, and bottled water. Usually kids fresh out of the warehouse were too dopey to do much more than wander around all shell-shocked.

Violet swapped the duffel to her other shoulder and cut across the culvert of yellowed grass to the parking lot pavement. By the time she was close to him, the boy had snatched an empty cart from one of the wasters and was dumping everything from his own into the replacement.

"Hey," Violet said. "Those Winnie the Pooh Band-Aids?"

The boy looked up, startled. The hood fell back off his head and Violet could see his face still had a bit of chub to it, the kiddie kind, but his eyes were sharp. A little bloodshot from crying, but focused. His black hair reminded her of a ball of steel wool, and she could see a comb mostly buried in the tangle. He yanked his sleeve down over the yellow patchwork on his elbow and stared back at her for a moment, mouth working for words.

"You're not a zombie," he finally said, in a voice that was a little closer to cracking than she'd expected from someone his size. It made her extra conscious of her own.

“Nobody’s a zombie,” Violet said, as the waster he’d swapped carts with stumbled past. “They don’t eat brains or anything. Just wander around being useless. We call them wasters.”

“Where’d you come from?” the boy asked.

Violet peeled the stretchy fabric of her shirt up off her stomach, showing him the rust-red Parasite under her pale skin. The boy immediately stuck his hand to his own belly. His face twitched.

“Same as you, Pooh Bear,” Violet said, tugging her shirt back down. “You thought you were the only one who got out?”

The boy frowned. “Is everyone else ... Is all the grown-ups ...” He tapped the back of his head, where the clamps went in.

“Everyone over sixteen,” Violet said. “Or around there.” She reached over and yanked the sleeping bag and a single bottle of water out from the cart. “What’s your name?” she asked.

“Bo,” the boy said. “Bo Rabiū.”

“Violet.” She stuffed the sleeping bag into his arms and tossed the bottle on top with a slosh. Getting groceries could wait. “Alright, Bo, time to get out of the streets,” she said. “The othermothers are going to start coming through soon.”

“What?”

“The o-ther mo-thers,” Violet enunciated. “You’ll see one soon enough. For now, we’re going to a safe spot, alright? A hideout. So you can meet Wyatt.”

Bo tucked the sleeping bag under his arm and tossed the water bottle up and down with his other hand. “Who’s he?” he asked suspiciously.

“He’s a jerk,” Violet said. “Let’s go.”

She set off back out of the parking lot, mapping the way back to the theater in her mind’s eye. She didn’t bother to check if Bo was following. They always did.

3

Bo slipped into the wake of the dark-haired girl named Violet as she weaved through the shuffling dim-eyed adults. It made Bo feel sick looking at them, seeing the shiny black piece of metal that dug into the backs of their heads and made the veins in their necks bulge. One man in a shredded business suit stopped abruptly on the sidewalk, reaching into his pocket to pull out an invisible phone. Bo nearly plowed into him, jerking away at the last second. He didn't quite manage to hide his shudder.

Violet stopped, shooting him a look over her shoulder. "Don't be scared of them," she said in her slightly scratchy voice. "They don't do anything."

"Not scared," Bo said reflexively, watching the businessman turn away, mouthing a conversation. "They stink real bad. That's all."

Violet bent to snatch something up off the sidewalk. It was an old cracked iPhone. She flashed Bo a smile, and for a moment he thought she was going to go up and put it into the businessman's empty fingers. Instead, she juggled it once in her hand, then hurled it at the back of the man's head. His neck snapped forward. Then he steadied himself, continuing his pantomimed phone call with a tiny trickle of carmine running down his scalp where the cracked screen had cut him.

"They're like NPCs," Violet said. Her smile didn't crinkle her eyes. "Think of them like that. Not like people."

"They are, though," Bo said. "People." He'd already had a horrible thought. He'd thought of going back to his burned house and finding his mother was alive but wandering through it with her eyes filmed over, smiling all empty-like. He didn't know which option would be worse: dead or a zombie. There was a reason he'd decided to get supplies first.

"Not anymore," Violet said in an icy voice. "Clamp's in the head, better off dead. Got it?"

Bo glanced away, pretending to tend to his elbow. Violet had already decided which was worse. He couldn't think about his mom yet, anyway. He had to think about Lia. If he was going to rescue her from the

warehouses, he was going to need help. At the very least, he was going to need to know what had happened on the outside during the four months he'd been locked away. Violet seemed like she knew those things.

As for the other mothers, whatever they were, Bo still remembered the slimy silhouette dumped from the belly of the whale-thing, and it still made him shiver.

"Got it," he said.

Violet gave him a skeptical look, one eyebrow cocked high, then turned and hurried on. Bo followed. She was taking him into the oldest part of the downtown, past an ancient hotel where his mom had told him to be careful of strangers and stepping on needles. The sidewalks were narrower and crooked, with a blackish moss seeping through the cracks. One waster they passed was knocking her fist against a graffiti-splashed brick wall, over and over, like she thought it was a door. Her knuckles were a mess of raw meat.

"They look happier than they used to," Violet said, catching him off guard. "The wasters who hang around here. Happier than before they got clamped."

"What do they see?" Bo asked.

"Dunno," Violet said. "Not us." She gave a vague wave around the street. "Something nicer than this, I bet. Lots nicer."

They came to a halt in front of an old theater Bo remembered passing on the bus once, maybe twice. It had been closed for years. The signage had more blank white spaces than it did black letters, making it look like a wide gappy grin, and the few movie posters that hadn't been snatched were curled and yellow inside their glass slots. Most of the globe lights around them had been smashed. Up on the top of the building, Bo saw the name of the place, Garneau Cinema, painted in dark red letters that were peeling like scabs.

The door had been boarded over with a two-by-four, but Violet skipped up and yanked it open, showing the plywood to be nailed on only one side. The inside looked dark, dark as the warehouse, and Bo smelled dust and mothballs and what might have been old popcorn grease.

"Why not the IMAX theater?" Bo asked, hesitating on the threshold. "They have those comfy seats. Memory foam seats."

"Be full of wasters pretending to watch movies, wouldn't it," Violet said. "Come on in. You know Peter Pan?"

"Sort of," Bo said.

“This is Neverland,” Violet said. “Come meet the Lost Boys.”

“Who are you, then?” Bo asked. “You, uh, Tinkerbell?”

“Fuck you,” Violet said, flashing that smile again that was both pretty and scary. It was better than the dull grins of the drugged-up warehouse kids or the wasters. That counted for something.

Bo stepped into the musty entryway, and she eased the door shut behind him. The dark gave him a nervous drop in his stomach, and the Parasite gave a sluggish twitch. He was half relieved, half disappointed that it was finally moving again. He’d thought maybe it was dead after whatever had happened with the fence.

Violet switched on a bulky black-and-yellow flashlight, thumping it a few times with the heel of her hand. In the stark beam Bo saw the interior of the theater was floored with cigarette-scorched carpeting. The wallpaper had water stains.

But there weren’t any whirlybirds. He licked his dry lips and followed Violet past the abandoned ticket booth and concession stand, where the smell of ancient cooking grease still hung off a defunct popcorn machine. Through a set of faux-oak doors thrown wide open, Bo saw the blank movie screen, half-illuminated by mismatched lamps. Violet led the way in, switching off her flashlight. Stripes of exit lighting still glowed faintly on the floor.

The theater had velvet red seats, some of them with armrests torn away or their cushions slashed open, and some of them had kids splayed on them. Bo had a sudden thought: Maybe his sister was already here. Lia’d always been smarter than him. Maybe the power outage had affected all the warehouses, or maybe she’d gotten out before that, somehow. Bo looked hopefully over the ten or so kids, most of them clustered in a group near the front, others scattered.

None of them looked older than Violet, who Bo had pegged for fifteen—the carefully drawn makeup around her eyes made it harder to tell. And none of them were his sister.

Bo sank a bit. Some of the kids gave him curious looks as he followed Violet along the aisle, but most of them kept their attention fixed toward the front, where a tall and bony boy maybe Violet’s age, maybe a bit older, was seated on the edge of the stage. He had a messy blond head and gray eyes, and Violet was fixing her hair all of a sudden.

“... at least a block away before you start heading back here,” the boy

was saying, splayed back with one leg dangling off the edge, swinging slow like a pendulum. “We don’t want mothers following us back, right? So we have to be careful, right?”

“Right,” came the reply, a dozen intent mutters.

“Elliot knows, don’t you, El?” the older boy said, flicking a look to one of the kids in the front, a slightly younger brown-haired boy hunched on the edge of his seat.

“I know,” Elliot said solemnly, and the older boy, who Bo could guess by now was Wyatt, gave him an affirming nod in return. As Wyatt’s gray eyes traveled back over the theater seats, they caught on Bo and Violet. He smiled, bright and white, how Bo had seen mostly in movies.

“All the under-tens, you go everywhere in doubles when there’s othermothers out,” Wyatt continued. “From now on. And what if the mother stops and squats and squeezes her glands? What’s she doing?”

“Pheromones,” the kids chanted, in unison this time. Bo sideways-saw Violet forming the word on her pink lips.

“So what do we do?” Wyatt asked. “Elliot?”

“If a mother drops ’mones, don’t breathe through your nose,” the boy named Elliot recited, wiping at his own with the neck of his oversized orange T-shirt.

“Right,” Wyatt said. “Breathe through your mouth and get away from there quick, or you’ll be following her right back to the warehouses.”

A collective shiver went through some of the kids, and Bo took a second look to note their slightly distended stomachs. One pale boy had no shirt on, and he could see the rust-colored tendrils splayed around his belly button like a flower. Bo’s own Parasite gave a wriggle of recognition. He didn’t recall any of their faces from the four months he’d been inside, but he didn’t know how many warehouses there were either.

“That’s it,” Wyatt said. “Everyone clear out so I can talk with Vi and our new recruit, alright?” He paused. “What’s it take to be a Lost Boy?”

“Guts,” the kids chorused.

Wyatt nodded, then they all slid off their seats and started filing past. Most of them shot looks at Bo on the way, some friendly, some not. Bo had been new before. He met the gazes cool and calm, how Lia had told him to do, not too friendly but not too mean. Bo remembered getting the bus together to their first day at a new school, in a new country, back when they both had their accents still.

You can just look at the spot between their eyes, if it's hard, she'd advised. Shouldn't need to, though.

Why? Bo'd asked, sticking his head against the cold glass window.

You're cooler than them. Then she'd jabbed him under the ribs, right where he hated it. *Not as cool as me, though.*

VELOCITY WEAPON
by
Megan E. O'Keefe

The first book in this epic space opera by award-winning author Megan E. O'Keefe is a story of dazzling space battles, intergalactic politics, and rogue AI with deadly secrets.

The last thing Sanda remembers is her gunship breaking up around her. She expected to awaken in friendly hands. Instead she awakens 230 years later upon an empty enemy smartship who calls himself Bero. The war is lost. The star system is dead. Ada Prime and its rival Icarion have wiped each other from the universe.

However, Bero may not be telling the whole truth.

Chapter 1

The first thing Sanda did after being resuscitated was vomit all over herself. The second thing she did was vomit all over again. Her body shook, trembling with the remembered deceleration of her gunship breaking apart around her, stomach roiling as the preservation foam had encased her, shoved itself down her throat and nose and any other ready orifice. Her teeth jarred against each other, and her fingers fumbled with temporary palsy against the foam stuck to her face.

God, she hoped the palsy was temporary. They told you this kind of thing happened in training, that the shaking would subside and the “explosive evacuation” cease. But it was a whole hell of a lot different to be shaking yourself senseless while emptying every drop of liquid from your body than looking at a cartoonish diagram with friendly letters claiming “Mild Gastrointestinal Discomfort.”

It wasn’t foam covering her. She scrubbed, mind numb from coldsleep, struggling to figure out what was encasing her. It was slimy and goopy and—Oh, no. Sanda cracked a hesitant eyelid and peeked at her shaking fingers. Her hands were coated in thick, clear jelly with a slight bluish tinge. The stuff was cold, making her trembling worse, and with a sinking gut she realized what it was. She’d joked about the stuff in training with her fellow gunshippers. Snail snot. Gelatinous splooge. But its real name was MedAssist Incubatory NutriBath, and you only got dunked in it if you needed intensive care with a capital *I*.

“Fuck,” she tried to say, but her throat rasped on unfamiliar oxygen. How long had she been in here? Sanda opened both eyes, ignoring the cold gel running into them. She lay in a white enameled cocoon, the lid removed to reveal a matching white ceiling inset with true-white bulbs. Their brightness made her blink.

The NutriBath was draining, and now that her chest was exposed to cold air the shaking redoubled. Gritting her teeth against the spasms, she felt around the cocoon, searching for a handhold.

“Hey, medis,” she called, then hacked up a lump of gel. “Got a live one in here!”

No response. Assholes were probably waiting to see if she could get out under her own power. Could she? She didn’t remember being injured in the blast. But, then, the medis didn’t stick you in a bath for a laugh. She gave up her search for handholds and fumbled shaking hands over her body, seeking out scars. The baths were good, but they wouldn’t have left a gunnery sergeant like her in the tub long enough to fix any cosmetic damage. The gunk was only slightly less expensive than training a new gunner.

Her face felt whole, chest and shoulders smaller than she remembered but otherwise unharmed. She tried to crane her neck to see down her body, but the unused muscles screamed in protest.

“Can I get some assistance down here?” she called out, voice firmer now that it’d been cleared of the gel. Still no answer. Sucking down a few sharp breaths to steel herself against the ache, she groaned, lifted her torso up on her elbows until she sat straight, legs splayed out before her.

Most of her legs, anyway.

Sanda stared, trying to make her coldsleep-dragging brain catch up with what she saw. Her left leg was whole, if covered in disturbing wrinkles, but her right ... That ended just above the place where her knee should have been. Tentatively, she reached down, brushed her shaking fingers over the thick lump of flesh at the end of her leg.

She remembered. A coil fired by an Icarion railgun had smashed through the pilot’s deck, slamming a nav panel straight into her legs. The pod chair she’d been strapped into had immediately deployed preserving foam—encasing her, and her smashed leg, for Ada Prime scoopers to pluck out of space after the chaos of the battle of Dralee faded. She picked at her puckered skin, stunned. Remembered pain vibrated through her body and she clenched her jaw. Some of that cold she’d felt upon awakening must have been leftover shock from the injury, her body preserved in a moment of panic.

Any second now, she expected the pain of the incident to mount, to catch up with her and punish her for putting it off so long. It didn’t. The NutriBath had done a better job than she’d thought possible. Only mild tremors shook her.

“Hey,” she said, no longer caring that her voice shook. She gripped

either side of her open cocoon. “Can I get some fucking help?”

Silence answered. Choking down a stream of expletives that would have gotten her court-martialed, Sanda scraped some of the gunk on her hands off on the edges of the cocoon’s walls and adjusted her grip. Screaming with the effort, she heaved herself to standing, balancing precariously on her single leg, arms trembling under her weight.

The medi bay was empty.

“Seriously?” she asked the empty room.

The rest of the medi bay was just as stark white as her cocoon and the ceiling, its walls pocked with panels blinking all sorts of readouts she didn’t understand the half of. Everything in the bay was stowed: the drawers latched shut, the gurneys folded down and strapped to the walls. It looked ready for storage, except for her cocoon sitting in the center of the room, dripping NutriBath and vomit all over the floor.

“Naked wet girl in here!” she yelled as loud as she could. Echoes bounced around her, but no one answered. “For fuck’s sake.”

Not willing to spend god-knew-how-long standing around in a stew of her own body’s offings, Sanda clenched her jaw and attempted to swing her leg out. She tipped over the edge and flopped face-first to the ground instead.

“Ow.”

She spat blood and picked her spinning head up. Still no response. Who was running this bucket, anyway? The medi bay looked clean enough, but there wasn’t a single Ada Prime logo anywhere. She hadn’t realized she’d miss those stylized dual bodies with their orbital spin lines wrapped around them until this moment.

Calling upon half-remembered training from her boot camp days, Sanda army-crawled her way across the floor to a drawer that was longer than all the rest. By the time she reached it she was trembling again and panting hard, but pure anger drove her forward. Whoever had come up with the bright idea to wake her without a medi on standby needed a good, solid slap upside the head. She may have been down to one leg, but Sanda was pretty certain she could make do with two fists.

She yanked the drawer open and hefted herself up high enough to see inside. No crutches, but she found an extending pole for an IV drip. That’d have to do. She levered herself upright and stood a moment, back pressed against the wall, getting her breath. The hard metal of the stand bit into her

armpit, but she didn't care. She was on her feet again. Or foot, at least. Time to go find a medi to chew out.

The caster wheels on the bottom of the pole squeaked as she made her way across the medi bay. The door dilated with a satisfying swish, and even the stale recycled air of the empty corridor felt fresh compared to the nutrimess she'd been swimming in. She paused and considered going back to find a robe. Ah, to hell with it.

She shuffled out into the hall, picked a likely direction toward the pilot's deck, and froze. The door swished shut beside her, revealing a logo she knew all too well: a single planet, fiery wings encircling it.

Icarion.

She was on an enemy ship. With one leg.

Naked.

Sanda ducked back into the medi bay and scurried as quick as she could toward the panel-spotted wall, silently cursing each squeak of the IV stand's wheels. She had to find a comms link, and fast.

Gel-covered fingers slipped on the touchscreen as she attempted to navigate unfamiliar protocols. Panic constricted her throat, but she forced herself to breathe deep, to keep her cool. She captained a gunship. This was nothing.

Half-expecting alarms to blare, she slapped the icon for the ship's squawk box and hesitated. What in the hell was she supposed to broadcast? They hadn't exactly covered codes for "Help—I'm naked and legless on an Icarion bucket" during training. She bit her lip, decided to punch in her own call sign—1947—followed by 7500, the universal sign for a hijacking. If she was lucky, they'd get the hint: 1947 had been hijacked. Made sense, right?

She slapped *send*.

"Good morning, one-niner-four-seven. I've been waiting for you to wake up," a male voice said from the walls all around her. She jumped and almost lost her balance.

"Who am I addressing?" She forced authority into her voice, even though she felt like jumping straight back into her cocoon.

"This is AI-Class Cruiser Bravo-India-Six-One-Mike."

AI-Class? A smartship? Sanda suppressed a grin, knowing the ship could see her. Smartships were outside of Ada Prime's tech range, but she'd studied them inside and out during training. They were AGI processes—

artificial general intelligence—and while they were brighter than humans across the board, they still had human follies. Could still be lied to. Charmed, even.

“Well, it’s a pleasure to meet you, Cruiser. My name’s Sanda Greeve.”

“I am called The Light of Berossus,” the voice said.

Of course he was. Damned Icarions could never stick to simple call signs. They always had to posh things up by naming their ships after ancient scientists. She nodded, trying to keep an easy smile on while she glanced sideways at the door. Could the ship’s crew hear her? They certainly hadn’t heard her yelling earlier, but they might very well notice their ship talking to someone new.

“That’s quite the mouthful for friendly conversation.”

“Bero is an acceptable alternative.”

“You got it, Bero. Say, could you do me a favor? How many souls on board at the present?”

Her grip tightened on her IV stand, and she looked around for any other item she could use as a weapon. This was a smartship. Surely they wouldn’t allow the crew handblasters for fear of poking holes in their pretty ship. All she needed was a bottleneck, a place to hunker down and wait until Ada Prime caught her squawk and figured out what was up.

“One soul on board,” Bero said.

“What? That can’t be right.”

“There is one soul on board.” The ship sounded amused with her exasperation.

“In the medi bay, yes, but the rest of the ship? How many?”

“One.”

She licked her lips, heart hammering in her ears. She turned back to the control panel she’d sent the squawk from and, fingers trembling, pulled up the ship’s nav system. She couldn’t make changes from the bay unless she had override commands, but ... the whole thing was on autopilot. If she really was the only one on board ... maybe she could convince the ship to return her to Ada Prime. Handing a smartship over to her superiors would win her accolades enough to last a lifetime. Could even win her a fresh new leg.

“Bero, bring up a map of the local system, please. Light up any ports in range.”

A pause. “Bero?”

“Are you sure, Sergeant Greeve?”

Unease threaded through her. “Call me Sanda, and, yes, light her up for me.”

The icons for the control systems wiped away, replaced with a 3D model of the nearby system. She blinked, wondering if she still had goop in her eyes. Couldn’t be right. There they were, a glowing dot in the endless black, the asteroid belt that stood between Ada Prime and Icarion clear as starlight. Judging by the coordinates displayed above the ship’s avatar, she should be able to see Ada Prime. They were way out on the edge, sure, but they were within range.

“Bero, is your display damaged?”

“No, Sanda.”

She swallowed. Icarion couldn’t have ... wouldn’t have. They wanted the twin planets. Needed access to Ada Prime’s Casimir Gate.

“Bero. Where is Ada Prime in this simulation?” She pinched the screen, zooming out. The system’s star, Cronus, spun off in the distance, brilliant and yellow-white. Icarion had vanished, too.

“Bero!”

“Icarion initiated the Fibon Protocol after the battle of Dralee. The results were larger than expected.”

The display changed, drawing back. Icarion and Ada Prime reappeared, their orbits aligning one of the two times out of the year they passed each other. Somewhere between the two, among the asteroid belt, a black spiral began, reaching outward, consuming space in all directions. Asteroids vanished. Icarion vanished. Ada Prime vanished.

She dropped her head against the display. Let the goop run down from her hair, the cold glass against her skin scarcely registering. Numbness suffused her. No wonder Bero was empty. He must have been ported outside the destructive spiral. He was a smartship. He wouldn’t have needed human input to figure out what had happened.

“How long?” she asked, mind racing despite the slowness of coldsleep. Shock had grabbed her by the shoulders and shaken her fully awake. Grief she could dwell on later, but now she had a problem to work. Maybe there were others, like her, on the edge of the wreckage. Other evac pods drifting through the black. Outposts in the belt.

There’d been ports, hideouts. They’d starve without supplies from either Ada Prime or Icarion, but that’d take a whole lotta time. With a smartship,

she could scoop them up. Maybe get them all to one of the other nearby habitable systems before the ship's drive gave out. And if she was very lucky ... Hope dared to swell in her chest. Her brother and fathers were resourceful people. Surely her dad Graham would have had some advance warning. That man always had his ear to the ground, his nose deep in politics. If anyone could ride out that attack, it was them.

“It has been two hundred thirty years since the battle of Dralee.”

Acknowledgments

Prologue: Holden

Chrisjen Avasarala was dead.

She'd passed in her sleep on Luna four months earlier. A long, healthy life, a brief illness, and she left humanity very different than she'd found it. The newsfeeds all had obituaries and remembrances prerecorded and ready to spin out across the thirteen hundred systems to which humanity was heir. The chyrons and headlines had been hyperbolic: *The Last Queen of Earth* and *Death of a Tyrant* and *Avasarala's Final Farewell*.

No matter what they said, they hit Holden just as hard. It was impossible to imagine a universe that wouldn't bow to the little old woman's will. Even when the confirmation came to Laconia that the reports were true, Holden still believed deep in his bones that she was out there somewhere, irritated and profane and pushing herself past all human limits to bend history just another fraction of a degree away from atrocity. It was almost a month between the moment he heard the news and the first time he let himself accept that it was true. Chrisjen Avasarala was dead.

But that didn't mean she was finished.

A state funeral had been planned on Earth before Duarte intervened. Avasarala's time as secretary-general of the United Nations had been a critical period in history, and her service not only to her world but to the whole human project had earned her a place of honor that could never be forgotten. The high consul of Laconia thought it only right and proper that she find her final resting place at the heart of the new empire. The funeral would be at the State Building. A memorial would be built to her so that she would never be forgotten.

The part where Duarte was complicit in the vast slaughter on Earth that defined Avasarala's career got skipped over. History was in the process of being rewritten by the winners. Holden was pretty sure that even though it didn't make it into the press releases and state newsfeeds, everyone remembered that she and Duarte had been on opposite sides, back in the day. And if they didn't, he certainly did.

The mausoleum—her mausoleum, since there wasn't anyone else of sufficient stature to share it with her yet—was white stone polished micron-smooth. The great doors were closed now, the service concluded. A portrait of Avasarala filled the center panel on the north face of the structure. It was etched into the stone along with the dates of her birth and death and a few lines of poetry he didn't recognize. The hundreds of chairs arrayed around the podium where the priest had spoken were only about half-filled now. People had come from across the empire to be here, and now that they were, they mostly broke into little clumps with whoever they already knew. The grass around the crypt wasn't like the stuff back on Earth, but it filled the same ecological niche and behaved similarly enough that they called it grass. The breeze was warm enough to be comfortable. With the palace behind him, Holden could almost pretend that he might walk out to the wilderness beyond the palace grounds and go wherever he chose.

His clothes were of Laconian military cut, blue with the spread wings that Duarte had picked for his imperial icon. The collar was high and stiff. It scraped the skin along the side of Holden's neck. The place where his insignia of rank would have gone was blank. Empty was apparently the symbol of the honored prisoner.

"Will you be going in to the reception, sir?" a guard asked.

Holden wondered what exactly the escalation tree looked like when he said no. That he was a free man, and rejected the hospitality of the palace. Whatever it was, he was pretty sure it had already been practiced and rehearsed. And he probably wouldn't enjoy it.

"In a minute," Holden said. "I just want to . . ." He gestured vaguely at the tomb as if the inevitability of death was a kind of universal hall pass. A reminder that all human rules were tentative.

“Of course, sir,” the guard said, and faded back into the crowd. Holden didn’t have any sense that he was free, though. *Unobtrusively confined* was as much as he could hope for.

One woman stood alone at the base of the mausoleum, looking up at Avasarala’s portrait. Her sari was a vibrant blue that was just close enough to the Laconian color scheme to be polite and just far enough from it to make it perfectly clear that the politeness was insincere. Even if she hadn’t looked like her grandmother, the subtle-not-subtle *fuck you* would have identified her. Holden ambled over.

Her skin was darker than Avasarala’s had been, but the shape of her eyes when she glanced over at him and the thinness of her smile were familiar.

“I’m sorry for your loss,” Holden said.

“Thank you.”

“We haven’t been introduced. I’m—”

“James Holden,” the woman said. “I know who you are. Nani talked about you sometimes.”

“Ah. Well, that must have been something to hear. She didn’t always see things the way I did.”

“No, she did not. I’m Kajri. She called me Kiki.”

“She was an amazing woman.”

They were silent for the space of two long breaths together. The breeze made the fabric of Kajri’s sari ripple like a flag. Holden was about to step away when she spoke again.

“She would have hated this,” she said. “Hauled into the camp of her enemies to be celebrated now that she can’t crack their balls anymore. Co-opted as soon as she couldn’t fight back. You could power a planet by hooking a turbine to her right now. That’s how much she’s spinning in this grave.”

Holden made a small sound that could have been agreement.

Kajri shrugged. “Or maybe not. She might have just thought it was funny. I could never be sure with her.”

“I owed her a lot,” Holden said. “I didn’t always realize it at the time, but she did what she could to help me. I never got the chance to thank her. Or . . . I did, I guess, but I didn’t take it. If there’s anything I can do for you or your family . . .”

“You don’t seem to be in a position to do people favors, Captain Holden.”

Holden looked back at the palace. “Yeah, I’m not really at my best these days. But I wanted to say it all the same.”

“I appreciate the sentiment,” Kajri said. “And from what I’ve heard, you’ve managed to have some influence? The prisoner with the emperor’s ear.”

“I don’t know about that. I talk a lot, but I don’t know that anyone listens. Except the security detail. I assume they listen to everything.”

She chuckled, and it was a warmer, more sympathetic sound than he’d expected. “It isn’t easy, having no part of your life for just yourself. I grew up knowing that everything I said would be monitored, cataloged, filed, and judged for its potential to compromise me or my family. There’s a record in the intelligence service archives somewhere of every time I’ve had my period.”

“Because of her?” Holden said, nodding to the tomb.

“Because of her. But she gave me the tools to live through it too. She taught us to use everything shameful in our lives as a weapon to humiliate people who would diminish us. That’s the secret, you know.”

“What’s the secret?”

Kajri smiled. “The people who have power over you are weak too. They shit and bleed and worry that their children don’t love them anymore. They’re embarrassed by the stupid things they did when they were young that everyone else has forgotten. And so they’re vulnerable. We all define ourselves by the people around us, because that’s the kind of monkey we are. We can’t transcend it. So when they watch you, they hand you the power to change what they are too.”

“And she taught you that?”

“She did,” Kajri said. “But she didn’t know it.”

As if to prove the point, a guard moved across the grass toward them, keeping a respectful distance until he was sure they'd seen him and then gave them time to finish what they were saying before coming closer. Kajri turned to him, lifting her eyebrow.

"The reception is going to begin in twenty minutes, ma'am," the guard said. "The high consul specifically hoped to meet you."

"I wouldn't dream of disappointing him," she said with a smile Holden had seen before on other lips. Holden offered his arm, and Kajri took it. As they walked away, he nodded toward the tomb and the words written on it. IF LIFE TRANSCENDS DEATH, THEN I WILL SEEK FOR YOU THERE. IF NOT, THEN THERE TOO.

"It's an interesting quote," he said. "I feel like I should recognize it. Who wrote it?"

"I don't know," she said. "She only told us to put it on her grave. She didn't say where it came from."

Everyone who was anyone had come to Laconia. That was true on several levels. Duarte's plan to shift the center of humanity away from Sol system to the heart of his own empire had found a level of cooperation and consent that shocked Holden at first and then left him with a permanent sense of mild disappointment in humans as a species. The most prestigious scientific research institutes had all moved their headquarters to Laconia. Four different ballet companies threw off centuries of rivalry to share the same Laconian Institute of Art. Celebrities and scholars rushed to new, palatial, state-subsidized estates in the capital city. There were already movies being made there. The soft power of culture set on speed scrub, ready to flood the networks and feeds with the reassuring messages of High Consul Duarte and the permanence of Laconia.

Business came too. Duarte had banks and office campuses pre-built and ready for tenants. The Association of Worlds wasn't just Carrie Fisk in a shitty office on Medina Station anymore. It was a cathedral in the center of

the capital city with a lobby bigger than a hangar bay and stained glass walls that seemed to rise up forever. The Transport Union's central authority was there too, in a lesser building with fewer amenities so that it was clear physically and socially who was in favor and who was on notice. Holden watched it all from the State Building that was his home and his prison, and it left him thinking of living on an island.

Within the boundary of the city, Laconia was cleaner, newer, brighter, and more controlled than most space stations Holden had been on. Just outside it was wilderness like he'd only seen in storybooks. Ancient forests and alien ruins that would take generations to tame and explore. Holden had heard gossip and rumors about the remnant technologies brought to shambling life by the early work with the protomolecule: boring worms the size of spacecraft, doglike repair drones that made no distinction between mechanism and flesh, crystalline caves with piezoelectric effects that induced hallucinations of music and crippling vertigo. Even as the capital city became synonymous with humanity as a whole, the planet around it stayed alien. An island of the profoundly familiar in a sea of we-don't-understand-that-yet. In a way, it was reassuring that Duarte, for all his god-emperor reach, couldn't achieve everything in just a few decades.

In another way, it was terrifying.

The reception hall was grand, but not overblown. If Laconia had been built in Duarte's image, there was a weird thread of personal restraint in the high consul's soul. However grand the city was, however overwhelming his ambitions, Duarte's palatial compound and home wasn't gaudy or even particularly ornate. The ballroom was all clean lines and a neutral palette that reached for elegance without being too concerned with what anyone thought. Couches and chairs were placed here and there where people could rearrange them. Young people in military uniform served glasses of wine and spiced tea. More than power, Duarte made everything that surrounded him seem born of confidence. It was a good trick, because even after Holden saw through it, it still worked.

Holden accepted a glass of wine from a young woman and strolled through the shifting crowd. A few of the people, he recognized instantly.

Carrie Fisk of the Association of Worlds, holding court at a long table, with the governors of half a dozen colonies fighting to be the first one laughing at her jokes. Thorne Chao, the face of the most popular newsfeed coming out of Bara Gaon. Emil-Michelle Li in the flowing green dress that was her trademark when she wasn't in a movie. And for every face Holden could put a name to, there were a dozen more who looked vaguely familiar.

He moved through the thin social fog of polite smiles and nods of recognition that fell short of actual engagement. He was here because Duarte wanted him seen here, but the Venn diagram of people eager to curry favor with the high consul but also willing to risk his displeasure by cozying up to the state's highest-profile prisoner didn't have much overlap.

But it did have some.

"I'm not drunk enough for this."

Transport Union President Camina Drummer leaned against a standing table, her hands wrapped around a glass. Her face looked older in person. He could see the lines around her eyes and mouth more clearly when there weren't a camera, a screen, and several billion kilometers between them. She shifted a degree, making room for him at the table, and he accepted the invitation.

"I'm not sure what drunk enough for this looks like," he said. "Blackout drunk? Fighting drunk? Weeping-in-the-corner drunk?"

"You don't seem even tipsy."

"I'm not. I'm mostly off of alcohol these days."

"Keeping your wits about you?"

"And it bothers my stomach."

Drummer smiled and coughed out a laugh. "They've let the honored prisoner out among the people. Makes me think you're not as useful to them anymore. Have they squeezed all the juice out of you?"

The way she said it, it could have been teasing between two old colleagues, fallen from power together and living in the twilight of political acceptability. Or it could have been something more. A way to ask if he'd been forced to betray the underground on Medina yet. If they'd decided to break him. Drummer knew as well as he did who was listening, even here.

“I’ve been helping as much as I can with the alien threat issue. Anything else he asks me about, all my answers would be yesterday’s news anyway. And I assume I’m here now because Duarte thinks I’m useful to him here.”

“Just part of the donkey show.”

“Dog and pony,” Holden said. Then, seeing her reaction. “The phrase is dog and pony show.”

“Sure it is,” she said.

“What about you? How’s the dismantling of the Transport Union going?”

Drummer’s eyes brightened and her smile widened. She answered in a perfect newsfeed-ready voice, crisp and warm and false as a carved acorn. “I am very pleased with the smooth transition to fuller oversight by the Laconian authority and the Association of Worlds. Our focus is to keep all of the old practices that were working and streamline and integrate new procedures that will cut away the dead wood. We have been able to maintain and even increase the efficiency of trade without compromising the security that the greater destiny of humanity requires.”

“That bad?”

“I shouldn’t bitch. It could be worse. As long as I’m a good little soldier and Duarte thinks I’ll be useful bringing Saba in from the cold, I won’t end up in a pen.”

A murmur rose from the main entrance, and a disturbance in the crowd. All through the ballroom, attention shifted like iron filings aligning to a magnet. Holden didn’t have to look to know that Winston Duarte had arrived, but he did anyway.

Duarte’s uniform was almost the same as Holden’s. He had the same affable calm that he seemed to carry everywhere. His security detail was more obvious than whatever surveillance was on Holden, though. Two thick-bodied guards with sidearms and eyes that flickered with implanted tech. Cortázar had arrived with him too, but stood apart with the air of a teenager pulled away from a game for family dinner. The actual teenager—Duarte’s daughter, Teresa—walked at her father’s side like a shadow.

Carrie Fisk scurried up to Duarte, her coterie of governors abandoned, and shook his hand. They talked for a moment before Fisk turned to Teresa and shook the girl's hand too. A little crowd had started coalescing behind Fisk as people tried to be unobtrusive about jockeying for a position to meet the great man.

"Creepy son of a bitch, isn't he?" Drummer said.

Holden grunted. He didn't know what she was talking about. It might have been just the way everyone around him was so trained to obeisance. That would have been enough. But maybe she saw something of what Holden did: the stuttering of his eyes, the pearlescent shadow under his skin. Holden had seen the protomolecule in action as much as anyone who wasn't in Cortázar's lab. That was probably why the side effects of Duarte's treatments were more obvious to him.

He realized he was staring. More than that, he realized that everyone was staring, and he was being drawn along by the pressure of their attention. He looked back at Drummer, making the conscious effort to turn away. It was harder than he liked to admit.

He wanted to ask if there was news of the underground, whether Duarte's reign seemed as inevitable out in the wide vacuum between the worlds as it did here in his home.

"Any news of the underground?" he asked.

"There are always going to be some malcontents," she said, walking the line between innocuous and meaningful. "What about you? How is the famed Captain James Holden spending his days? Going to parties? Waving tiny fists in impotent rage?"

"Nope. Just plotting and waiting for my moment to strike," Holden said. They both grinned as if it had been a joke.

Chapter One: Elvi

The universe is always stranger than you think.

That had been the favorite phrase of a professor of Elvi's back in her graduate study days. Professor Ehrlich, a grumpy old German with a long white beard who'd always made Elvi think of garden gnomes, repeated it every time someone was surprised by the results their lab test delivered. At the time, Elvi had found the catchphrase true to the point of triteness. Of course the universe had unexpected surprises.

Professor Ehrlich was almost certainly dead. He'd been at the edge of what anti-aging technology could achieve when Elvi was in her early twenties. She had a daughter older than that now. But if he'd still been alive, Elvi would have sent him a lengthy and heartfelt apology.

The universe wasn't just stranger than you knew, it was stranger than you could know. Every new wonder, no matter how astonishing, just laid the foundation for an even more astounding discovery later. The universe and its constantly shifting definition of what was considered strange. The discovery of what everyone thought was alien life when the protomolecule was found on Phoebe had shaken people to their foundations, and was somehow still less disturbing than the discovery that the protomolecule wasn't an alien so much as it was an alien's tool. Their version of a wrench, only a wrench that converted the entire asteroid station of Eros into a spaceship, hijacked Venus, created the ring gate, and gave sudden access to thirteen hundred worlds beyond.

The universe is always stranger than you think. God damn right, Professor.

"What," her husband Fayez said, "is that?"

They were on the bridge of her ship, the *Falcon*. The ship that the Laconian Empire had given her. On the screen in front of them, a high-resolution image of what everyone was calling *the object* slowly filled in. It was a planetary body a little larger than Jupiter and nearly transparent, like an enormous crystal ball with a faintly greenish hue. The only structure in the Adro system.

“Passive spectrometry says almost entirely carbon,” Travon Barrish said, not even looking up from his work screen as the data scrolled by. He was the team’s materials scientist, and the most literal person Elvi had ever met. Of course he gave Fayez the factual answer to his question. She knew that wasn’t what her husband had been asking. He’d been asking, *Why is that?*

“It’s packed into a dense lattice,” Jen Lively, the team’s physicist, said. “It . . .”

She trailed off, so Elvi finished for her. “It’s a diamond.”

When she was seven years old, Elvi Okoye had returned to Nigeria with her mother when her great-aunt, a woman Elvi had never met, died. As her mother worked to take care of funeral arrangements, Elvi wandered through her house. It became a game of sorts, seeing how much of a picture of the dead woman she could create by looking at the objects she’d left behind. On a shelf next to the bed, a picture of a smiling young man with dark skin and pale eyes who could have been a husband, or a brother, or a son. In the tiny bathroom, among the scattered packages of cheap soaps and cleansers, one beautiful crystal bottle filled with mysterious green liquid. Perfume? Poison? Without having known the woman herself, all the objects she’d left behind were fantastic and compelling.

Many years later, while rinsing her mouth, the smell triggered a memory and she realized the green liquid in the bottle had almost certainly been mouthwash. One mystery solved, but new questions arose. Why had she put mouthwash in such a beautiful bottle instead of just leaving it in the recyclable container it came in? Where had the bottle come from originally? Had she used it as mouthwash, or was there some hidden function mouthwash could perform that Elvi had never thought of? Without the dead

woman to explain, it would forever remain a mystery. Some things could only ever be understood in context.

On the view screen, a single faintly green diamond with a machine-perfect smooth surface floating in a solar system with no other planets, orbiting one fading white dwarf star. A bottle of mouthwash in cut crystal, surrounded by cheap soap on a dirty bathroom counter. Fayez was right. The only question that mattered was *why*, but everyone who knew was dead. The only answer she had left was Professor Ehrlich's.

The *Falcon* had been specially designed at the request of High Consul Duarte specifically for her, and it had only one mission: to visit the gate network's "dead systems" and see if they held any clues about the nameless enemy that had destroyed the protomolecule builders' civilization or the weird nonphysical bullets that they—or it, or whatever pronoun you used for an extradimensional alocal antecedent—had left behind.

The *Falcon* had visited three of those systems so far. Every time it had been a wonder. Elvi didn't like the phrase *dead system*. People had started calling them that because they contained no planets capable of sustaining life. She found the classification annoying and simplistic. Yes, it wasn't possible for any life they understood to live on a Jupiter-sized diamond floating around a white dwarf. But there was also no conceivable natural process that could account for such an artifact. Someone had made it. Engineering on a scale that was awesome in the classical sense of the word. Inspiring both wonder and dread in equal proportion. To write it off as *dead* because plants didn't grow on it felt like the dread winning out over the wonder.

"They swept up everything," Fayez said. He was flipping through telescope and radar images of the solar system. "There isn't even a cometary belt clear out to a light-year from the star. They grabbed every bit of material in this entire solar system, turned it into carbon, and mashed it into a fucking diamond."

"People used to give diamonds as gifts before proposing marriage," Jen said. "Maybe someone wanted to be sure the answer wasn't no."

Travon's head snapped up from his console, and he blinked at Jen for several seconds. His rigid literalism meant he was also chemically free of anything resembling a sense of humor, and Elvi had watched Jen's flippant irony put him into vapor lock more than once.

"I don't think—" Travon started, but Elvi cut him off.

"Stay focused on the job, people. We need to know everything about this system before we bring the catalyst online and start breaking things."

"Copy that, boss," Fayez said, and gave her a wink no one else could see.

The rest of her team, the very best scientists and technicians from across the empire, handpicked and placed under her command by the high consul himself, turned back to their displays. In scientific matters related to their current mission, her orders had the full force of imperial law. No one on the team ever argued.

The caveat being, of course, that not everyone was on her team, and not everything was considered a scientific matter.

"You want to tell him that we're pushing the rollout," Fayez said, "or should I?"

She looked at the screen again with a kind of longing. There were probably structures in the diamond. Traces like pale ink in a dead script that could point them a little further toward the next mystery, the next revelation, the next unutterable strangeness. She didn't want to tell anyone about anything. She wanted to *look*.

"I'll take care of it," Elvi said, and headed for the lift.

Admiral Mehmet Sagale was a mountain of a man with coal-black eyes in a dinner plate-flat face. As the military commander of their mission, he mostly left the scientists alone. But when something fell into an area where his orders specified he was in charge, he was as implacable and immovable as his size suggested. And something about sitting in his spartan office always felt disciplinary. Like being sent to the headmaster for cheating on a

test. Elvi hated playing the role of supplicant to a military figurehead. But in the Laconian Empire, the military always sat at the top of the authority chart.

“Dr. Okoye,” Admiral Sagale said. He rubbed the bridge of his nose with the tips of sausage-sized fingers and gazed at her with the same mix of affection and patronizing annoyance she had once given her children when they were doing something stupid. “We are woefully behind schedule, as you know. My orders are to—”

“This system is incredible, Met,” she said. Using the nickname was a little aggression, but one he tolerated. “It’s too incredible to just throw away out of impatience. We need to spend time really studying this artifact before you trot out the catalyst and wait to see if something blows up!”

“*Major* Okoye,” Sagale replied, using her military title to not so subtly remind her of their relative positions in the chain of command. “As soon as your team finishes their preliminary data collection, we will bring out the catalyst and see if this system has any military value, as per our orders.”

“Admiral,” Elvi said, knowing aggression would fail on him when he was in this mood and trying for a placating respect instead. “I just want a little more time. We can make up the schedule on our trip out. Duarte gave me the fastest science ship in human history so I could spend more time on the science and less on the travel. Exactly like I’m asking you to do now.”

Reminding Sagale that she had a direct line to the high consul, and that he valued her work enough to build her a ship for it. How was *that* for not so subtle.

Sagale was unmoved.

“You have twenty hours to finish gathering your data,” he said, folding his hands across his wide belly like a Buddha. “And not one minute more. Inform your team.”

“This sort of rigid thinking is *precisely* why it’s impossible to do good science under Laconian rule,” Elvi said. “I should be running a university

biology department somewhere. I'm too old to be good at taking orders."

"I agree," Fayez said. "But here we are."

She and Fayez were in her quarters to shower and catch a quick bite of food before Sagale and his storm troopers trotted out their live sample of protomolecule and risked destroying a billions-of-years-old artifact just to see if it went boom in a useful manner. "If it won't build them a better bomb, who cares if they break it!"

She whirled toward Fayez as she said it, and he took a half step away from her. She realized she was still holding her dinner plate in one hand. "I'm not going to throw it," she said. "I don't throw things."

"You have," he replied. He'd gotten older too. His once-black hair was almost totally gray now, and laugh lines spread out from the corners of his eyes. She didn't mind. She liked that he smiled more than he frowned. He was smiling now. "Things have been thrown."

"I never—" she started, wondering if he was actually afraid she'd throw a plate at him out of frustration or just teasing her to lighten the mood. Even after decades together, she sometimes couldn't tell what went on in his head.

"Bermuda, just after Ricki left home for university, we took our first real vacation in years and you—"

"There was a roach. A roach crawled on my plate!"

"It nearly took my head off when you hurled it."

"Well," she said, "I was startled."

She laughed. Fayez was grinning like he'd won a prize. So, of course, making her laugh had been the goal all along. She put the plate down.

"Look, I know saluting and following orders isn't exactly what we had in mind when we got our degrees," Fayez said. "But this is the new reality as long as Laconia's in control. So—"

It was her own fault, really, being swept up into the Science Directorate. Laconia by and large left people alone. Planets elected their own governors and representatives to the Association of Worlds. They could establish their own laws, as long as they didn't directly contravene imperial law. And unlike most dictatorships in history, Laconia seemed uninterested in

restricting higher education. The universities of the galaxy functioned pretty much like they had before the takeover. Sometimes even a little better.

But Elvi had made the mistake of becoming humanity's leading expert on the protomolecule, the vanished civilization that had created it, and the doom that had wiped it out. As a much younger woman, she'd been sent to Ilus as part of the first scientific mission to explore the biology of an alien world. Until then, her specialization in exobiology had been theoretical, mostly focusing on bathypelagic and deep-ice life that had seemed like good analogs for bacteria one might find under the surface of Europa.

They'd never found any bacteria on Europa, but the gate network opened, and suddenly exobiology was a real thing with more than thirteen hundred new biomes to explore. She'd gone to Ilus expecting to study lizard analogs, and instead run face-first into the artifacts of a galaxy-wide war older than her species. She'd become obsessed with understanding. Of course she had. A house the size of a galaxy, filled with rooms full of fascinating things, and the owners dead for millennia. She'd devoted the rest of her professional life to figuring them out. So when Winston Duarte invited her to lead a team to explore exactly that mystery, and gave her a bottomless grant to do it, she hadn't been able to say no.

At that point, she'd seen only the Laconia everyone was presented in the newsfeeds. Impossibly powerful, militarily unbeatable, but not interested in ethnic cleansing or genocide. Maybe even with humanity's best interests at heart. Taking their money to do science hadn't given her many qualms. Especially since there also hadn't been many options. When the king says, *Come work for me*, there aren't many paths to *No*.

The qualms came later when she was inducted into their military and learned the source of Laconia's overwhelming technological advantage.

When she met the catalysts.

"We should get back," Fayez said as he finished clearing away the last of their dishes from dinner. "The clock is ticking."

"I will. In a minute," she replied, stepping back into the tiny private bathroom they shared. One of the privileges of her rank. In the mirror over

her sink, an old woman stared back at her. The woman's eyes were haunted by what she was about to do.

"You ready in there?" Fayez shouted.

"You go ahead. I'll catch up."

"Jesus, Els, you're not going to go see it again, are you?"

It. The catalyst.

"It isn't your fault," Fayez said. "You didn't design this study."

"I agreed to oversee it."

"Sweetheart. Darling. Light of my life. Whatever we call Laconia in public, when you take its clothes off, it's a dictatorship," Fayez said. "We never had a choice."

"I know."

"So why do you do this to yourself?" Fayez said.

She didn't answer, because she couldn't have explained it even if she wanted to.

"I'll catch up."

The catalyst holding area was in the heart of the *Falcon*, surrounded on all sides by thick layers of depleted uranium shielding and the galaxy's most complicated Faraday cage. It had become clear very quickly that the protomolecule communicated at faster than light speed. Some application of quantum entanglement was the leading theory, but whatever the mechanism, the protomolecule defied locality, much like the ring gate system it had created. It had taken Cortázar and his team years to figure out how to keep a sample of the protomolecule from talking to itself, but they'd had decades and they'd eventually come up with a combination of materials and fields that tricked a node of protomolecule into locking itself off from the rest.

A node. *It. The catalyst.*

Two of Sagale's Marines guarded the door to its chamber. They wore heavy blue power armor that whined and clicked when they moved. Each

was equipped with a flamethrower. Just in case.

“We’re going to use the catalyst soon. I want to check on it,” Elvi said to the space between the two guards. For all that she had a military title, she still often couldn’t figure out who was the ranking officer in any given room. She lacked the indoctrination of boot camp, and the lifetime of practice the Laconians took for granted.

“Of course, Major,” the one on the left said. She looked too young to be the senior officer, but that was so often true of the Laconians. Most of them looked too young for their titles. “Will you need an escort?”

“No,” Elvi said. *No, I always do this alone.*

The young Marine did something on the wrist of her armor, and the door behind her slid open. “Let us know when you’re ready to come out.”

The catalyst’s room was a cube, four meters on a side. It had no bed, no sink, no toilet. Just hard metal and mesh drains. Once a day, the room was flushed with solvent and the liquid was sucked away to be incinerated. The Laconians were obsessive about contamination protocols where the protomolecule was concerned.

The node, it, the catalyst, had once been a woman in her late fifties. What her name had been and why she’d been selected for protomolecule infection was not in the official record Elvi had access to. But Elvi hadn’t been in their military for long before she found out about the Pen. The place where convicted criminals were sent to be deliberately infected, so that the empire would have a limitless supply of protomolecule to work with.

The catalyst was special, though. Through some work of Cortázar’s or through some accident of the woman’s genetics, she was only a carrier. She showed early signs of infection—changes to her skin and skeletal structure—but in the months since she’d been brought on board the *Falcon*, those changes hadn’t progressed at all. And she never entered what everyone called the “vomit zombie” phase, puking up material to try to spread the infection.

Elvi knew that she was perfectly safe in the same room with the catalyst, but she shuddered every time she entered anyway.

The infected woman looked at her with blank eyes and moved her lips in a soundless whisper. She smelled mostly of the solvent bath she received every day, but under it was something else. A morgue stink of decaying flesh.

It was normal to sacrifice animals. Rats, pigeons, pigs. Dogs. Chimpanzees. Biology had always suffered the cognitive push-pull of proving that humans were just another kind of animal while at the same time claiming to be morally different in kind. It was okay to kill a chimp in the name of science. It wasn't okay to kill a person.

Except, apparently, when it was.

Maybe the catalyst had agreed to this. Maybe it was this or some other, more gruesome death. Whatever that would be.

"I'm sorry," Elvi said to her, as she did every time she came into the catalyst chamber. "I'm so sorry, I didn't know that they did this. I would never have agreed to it."

The woman's head lolled on her neck, nodding forward as if in mock agreement.

"I won't forget that they did this to you. If I can ever make this right, I will."

The woman pushed at the floor with her hands as though she wanted to stand up, but her arms lacked the strength, and her hands flopped bonelessly. It was just reflexes. That's what she told herself. Instinct. The woman's brain was gone, or at least changed into something that wasn't by any sane definition a brain. There wasn't anyone really alive in that skin. Not anymore.

But there had been once.

Elvi wiped her eyes. The universe was always stranger than you expected. Sometimes it was full of wonders. Sometimes full of horrors.

"I won't forget."

Chapter Two: Naomi

Naomi missed the *Rocinante*, but then she missed a lot of things these days.

Her old ship and home was still parked on Freehold. Before they'd left, she and Alex had found a cavern system on the edge of Freehold's southernmost continent with a mouth big enough to edge the ship into. They'd put it down in a dry tunnel and spent a week running seals and storage tarps that would keep the local flora and fauna out. Whenever they got back to the *Roci*, it would be there, ready and waiting. If they never did, it would be there for centuries. Still waiting.

Sometimes, on the edge of sleep, she'd take herself through it. She still knew every centimeter from the top of the cockpit to the curve of the drive cone. She could think her way through it on the float or under thrust. She'd heard about ancient scholars back on Earth making palaces of memory that way. Imagine Alex in the cockpit, holding an hourglass for time. Then down to the flight deck, where Amos and Clarissa were tossing a golgo ball with the numeral 2 painted on it back and forth for initial and final velocities divided by two. Then down to her cabin, and Jim. Jim by himself. Jim who meant displacement. A simple kinematic equation, three things that were all the same, easy to remember because they all stung her heart.

That was one reason she'd agreed to the shell-game plan when Saba and the underground had reached out to her. Memories were like ghosts, and as long as Jim and Amos were gone, the *Roci* would always be a little bit haunted.

And it wasn't only Jim, though he had been the first. Naomi had also lost Clarissa, who would have died from the slow poisons in her implants if

she hadn't chosen to die by violence. Amos had taken a high-risk mission from the underground, deep in enemy territory, and then gone silent, missing pickup window after pickup window until they all stopped expecting to hear from him again. Even Bobbie, healthy and well, but in the captain's seat of her own ship now. They were all lost to her, but Jim was the worst.

Freehold, on the other hand, she didn't miss at all. The experience of being under a vast and empty sky had its charm for a while, but the unease lasted longer than the novelty. If she was going to live as a fugitive and outlaw, she could at least do it in something where the air was held in by something visible. Her new quarters—spare and terrible as they were—at least had that going for them.

From the outside, her bunk looked like a standard cargo container made to transport a low-yield planetary fusion reactor. It was the kind colonists in the thirteen hundred new systems would use to power a small city or a medium-sized mining station. With its actual cargo gone, there was enough room for a gimbaled crash couch, an emergency support recycler, a water supply, and half a dozen modified short-burn torpedoes. The crash couch was her bed and her workbench. The support recycler was her power and food and her waste disposal. The kind of thing that would keep the crew of a stranded ship alive for weeks, but not in anything like comfort. The water supply was for drinking, but also part of the stealth, connected to small evaporation panels on the exterior of the container to bleed off her waste heat.

And the torpedoes were how she spoke to the larger world.

Except not today. Today she was going to see actual people. Breathe their air, touch their skin. Hear their living voices. She wasn't sure if she was excited about that, or if the energy stirring in her belly was foreboding. The one could seem so much like the other.

"Permission to open?" she said, and the crash couch's monitor hesitated, sent the message, and then a few breaths later came back with CONFIRMED. DEPARTURE AT 18:45 STANDARD. DON'T BE LATE.

Naomi unstrapped herself from the couch and pushed to the inner door of the container, securing the helmet on her suit as she went. When the suit showed solid seals, she double-checked them anyway, then cycled the air in the container into her emergency recycler, bringing the interior down to near vacuum. When the pressure reached the efficiency limit of the unit and stopped dropping, she popped the container doors and pulled herself out into the vastness of the cargo hold.

The *Verity Close* was a converted ice hauler acting as a long-haul shipping vessel for the colonies. The hold around her was as wide as the Freehold sky, or it felt that way. The *Rocinante* and eleven more like her could have fit in it and not touched the sides. Instead, thousands of containers like Naomi's were locked into place and ready to be hauled out from Sol to any of the new cities and stations that humanity was building. Taming the new wilderness of planets that didn't know humanity's genetic codes or tree of life. And most of the containers were what they claimed—soil, industrial yeast incubators, bacterial libraries.

And then, like hers, a few were something else.

This was the shell game.

She didn't know if Saba had come up with the idea, or if his wife, the figurehead president of the Transport Union, had found some covert way to tell him. With Medina Station and the slow zone firmly under Laconian control, the greatest obstacle the underground faced was moving ships and personnel from one system to another. Even something as small as the *Roci* couldn't hope to pass by Medina's sensor arrays unnoticed. Traffic control through the gate network was too important to ever let that happen.

But as long as the Transport Union was still in charge of its own ships, the records could be forged. Cargo containers like hers could be moved from ship to ship, making it difficult if not impossible to track her communications—or Saba's or Wilhelm Walker's or any of the other organizing heads of the underground—to any one vessel.

Or, if the reward seemed to justify the terrible risk, something larger could be smuggled. Something dangerous. Something like the captured warship *Gathering Storm* could be snuck into Sol system. And with it,

Bobbie Draper and Alex Kamal, who she hadn't seen in over a year. And who, right now, were waiting for her at a private rendezvous.

She launched herself along the row of containers, skimming past them with accuracy born of a lifetime's practice. The guide lights blinked at the containers' edges, marking the ever-changing maze of access and control and leading her toward the crew hatch. The actual crew space was probably smaller than the *Rocinante*'s. Her secret cargo container, as spacious as the crew cabins.

She didn't know the crew of the ship that had carried her for the last months. Most of them weren't aware she was there. Saba arranged things that way. The fewer people knew, the less they could say. The old Belter term for it was *guerraregle*. War rules. It was how she'd lived as a girl, back in the bad old days. It was how she lived now.

She found the airlock into the ship and cycled through. Her contact was waiting for her. She was a young woman, not more than twenty years old, with pale skin and wide-set dark eyes. Her shaved head was probably meant to make her look tough, but it just reminded Naomi of baby fuzz. Her name might not have been Blanca, but that was how Naomi knew her.

"You're clear for twenty minutes, ma'am," Blanca said. She had a good voice. Musical and clean. A Martian accent that reminded Naomi of Alex. "After that, I'm off shift. I can stay around, but I can't keep the next guy from coming on."

"More than enough," Naomi said. "I just need to get to the habitation ring."

"Not a problem. We're going to be transferring your container to the *Mosley* in berth sixteen-ten. It's going to take a few hours, but the work order's already been approved."

The pea slipping into a different shell. By the time Naomi was ready to send out her next set of orders and analysis, the *Verity Close* would be past the Sol gate and off toward some other system. And Naomi would be in her same little hole, sleeping on her same little couch, but traveling with a different ship. Blanca would be replaced by her new contact waiting for her

at the docks. Naomi had lost track of how many times she'd done this. It was almost routine.

"Thank you," she said, and started to pull herself through toward the dockside airlock.

"It's been an honor, ma'am," Blanca said, spitting the words out quickly. "Meeting you, I mean. Meeting Naomi Nagata."

"Thank you for everything you've done for me. I appreciate it more than I can say."

Blanca braced. It felt like theater, but Naomi saluted the girl all the same. It meant something to the girl, and for Naomi to treat it with anything less than equal seriousness would have been rude. Worse, it would have been cruel.

Then she pulled herself into the cramped green corridor of the *Verity Close* and left Blanca behind. She didn't expect ever to see her again.

Deep Transfer Station Three lived between the orbit of Saturn and Uranus, locked in position with the Sol gate. Its architecture was familiar: a large spherical dock capable of accepting several dozen ships at maximum capacity and a habitation ring spinning at one-third g. It was both a critical central hub for traffic in and out of Sol system and a glorified warehouse complex. Ships from across the system brought cargo here ready to send out to the colony worlds or came to pick up incoming packages. At any given time, there were probably more alien artifacts on the transfer station than anyplace else in the system.

All told, the station could hold twenty thousand people, though the traffic rarely if ever demanded full capacity. A permanent staff and the crews of whatever ships came and went, along with contractors to run the hospitals, bars, brothels, churches, stores, and restaurants that seemed to follow humanity everywhere it went. It was a base where crews from across the system and from the other systems on the far sides of the rings could get away from each other for a few days, see unfamiliar faces, hear voices they

hadn't lived with for months, climb into bed with someone who didn't feel like family. It created a constant fraternization that had led to the station's ring getting the unofficial name "Paternity Row."

Naomi liked the place. There was something reassuring in the stability of human behavior. Alien civilizations and galactic empire, war and resistance: They were there. But also drinking and karaoke. Sex and babies.

She walked through the public corridor of the habitation ring with her head bowed. The underground had a false identification for her in the station system so that her biometrics wouldn't raise an alarm, but she kept from making herself too obvious all the same in case a human might recognize her.

The rendezvous was a restaurant in the lowest and outermost level of the ring. She'd expected to be ushered into a storeroom or freezer, but the man at the door led her back to a private dining room. Even before she stepped through the doorway, she knew they were there.

Bobbie saw her first and stood up, grinning. She wore a nondescript flight suit without identifying tags or patches, but she wore it like a uniform. Alex, rising with her, had an older cut. He'd lost weight, and his remaining hair was trimmed close. He could have been an accountant or a general. Without words, they stepped into each other, arms raised. A three-way embrace with Naomi's head on Alex's shoulder, Bobbie's cheek against hers. The warmth of their bodies was more comforting than she wanted it to be.

"Oh, God dammit," Bobbie said, "but it is good to see you again."

The embrace broke, and they moved to the table. A bottle of whiskey and three glasses waited, a clear and unmistakable sign of bad news to come. A toast to be made, a memory to be honored, another loss to carry. Naomi asked her question with a glance.

"You heard about Avasarala," Alex said.

The relief came in a little rush followed by chagrin at feeling relief. It was only that Avasarala had died. "I did."

Bobbie poured out shots for each of them, then raised one. "She was a hell of woman. We won't see her like again."

They touched glasses, and Naomi drank. Losing the old woman was hard—harder for Bobbie, probably, than any of the rest of them. But they weren't mourning Amos yet. Or Jim.

"So," Bobbie said, putting down her glass, "how's life as the secret general of the resistance?"

"I prefer 'secret diplomat,' " Naomi said. "And it's underwhelming."

"Wait, wait, wait," Alex said. "Can't talk without food. It's not family unless there's a meal."

The restaurant did a good Belt/Mars fusion menu. Something called white kibble that was related to the real thing, but with fresh vegetables and bean sprouts. Rounds of vat-grown beef-pork hybrid cooked in the shape of a Petri dish and touched with a sweet hot sauce. They leaned on the table here the way they had on the *Rocinante* in their previous incarnations.

Naomi hadn't realized how much she missed Bobbie's laugh or Alex's way of sneaking another small helping onto her plate when she was almost finished eating. The little intimacies of living in close quarters with someone for decades. And then not living there anymore. It might have made her sad if it weren't for the pleasure of being there in the moment with the two of them.

"The *Storm*'s crewed up pretty well," Bobbie was saying. "I was worried for a while that it would be straight Belters. I mean, that's where Saba's bench is the deepest. Two Martian vets running a crew full of folks who still call us inners?"

"Could have been a problem," Naomi agreed.

"Saba pulled a whole sheet of UNN and MCRN vets," Alex said. "Young ones too. Weird being around people who were the age I was when I mustered out. They look like babies, you know? All fresh-faced and serious."

Naomi laughed. "I know. Anyone under forty looks like a child to me now."

"They're good," Bobbie said. "I've been running drills and simulations the whole time we've been parked."

"There've been a couple fights," Alex said.

“It’s just nerves,” Bobbie said. “When this mission’s done, that shit will evaporate.”

Naomi took another bite of white kibble so that she wouldn’t frown. It didn’t work, though. Alex cleared his throat and spoke in his changing-the-subject voice. “I’m guessing there’s still no word from the big guy?”

Two years before, Saba had found a chance to slip an operative onto Laconia itself with a pocket nuke and an encrypted recall-and-retrieve transmitter. A long-odds mission to get Jim back, or destroy Laconia’s rule by cutting off its head. Saba had asked Naomi who she would trust with something that important. That dangerous. When Amos heard about it, he’d packed his bags in the same hour. Since then, Laconia had built new defenses. The underground had lost most of its presence in Laconia system, and Amos had gone silent.

Naomi shook her head. “Not yet.”

“Yeah, well,” Alex said. “Soon, probably.”

“Probably,” Naomi agreed, the same way she did every time they had this conversation.

“You two want any coffee?” Alex asked. Bobbie shook her head at the same time Naomi said *Not for me*, and Alex popped up. “I’ll go settle up, then.”

When the door closed behind him, Naomi leaned forward. She wanted to leave the moment where it was—a reunion with family. A bright spot in the darkness. She wanted to, and she couldn’t.

“A mission with the *Storm* in Sol system is a hell of a risk,” she said.

“It stands a real chance of getting some attention,” Bobbie agreed, not making eye contact. Her tone was light, but there was a warning in it. “It’s not just me, you know.”

“Saba.”

“And others.”

“I keep thinking about Avasarala,” Naomi said. There was still some whiskey in the bottle, and she poured herself a finger. “She was a hell of a fighter. Never backed down from anything, even when she lost.”

“She was one of a kind,” Bobbie agreed.

“She was a fighter, but she wasn’t a warrior. She was always leading the struggle, but she did it by finding other ways to get the work done. Alliances, political pressure, trade, logistics. Her strategy was always that violence came last.”

“She had leverage,” Bobbie said. “She ran a planet. We’re a bunch of rats looking for cracks in the concrete. We’re going to do things differently.”

“We have leverage,” Naomi said. “And more than that, we can cultivate leverage.”

Bobbie put down her fork very carefully. The darkness in her eyes wasn’t anger. Or it wasn’t just anger, anyway. “Laconia is a military dictatorship. If you want anyone to stand against Duarte, we have to show people that he can be stood against. Military action is what shows people that there’s hope. You’re a Belter, Naomi. You know this.”

“I know that it doesn’t work,” Naomi said. “The Belt fought for generations against the inner planets—”

“And won,” Bobbie said.

“We didn’t, though. We didn’t win. We held on until something came in and knocked over the playing board. Do you really think we’d have gotten something like the Transport Union if the gates hadn’t appeared? The only way we succeeded was by something totally unexpected changing the rules. Only now we’re acting like it’ll work twice.”

“We’re acting?”

“Saba’s acting,” Naomi said. “And you’re backing him.”

Bobbie leaned back, stretching the way she did when she was annoyed. It made her seem even bigger than she was, but Naomi was a hard woman to intimidate. “I know you disagree with the approach, and I know you’re not happy that Saba didn’t put you in on the details, but—”

“That’s not the issue,” Naomi said.

“No one’s arguing against leverage. No one’s saying that we shouldn’t be looking for political angles too. But pacifism only works when your enemy has a conscience. Laconia has a deep tradition of discipline through punishment and I know—No, hear me out. I know that because it’s a

Martian tradition too. You grew up with the Belt, but I grew up with Mars. You tell me that my way doesn't lead to victory? Okay. I believe you. But I'm telling you that your soft approach doesn't work on these people."

"So where does that leave us?"

"Same place as always," Bobbie said. "Doing the best we can for as long as we can and hoping something unexpected happens. On the upside, something unexpected almost always does."

"That's not as comforting as you think," Naomi said with a chuckle, trying to lighten the mood.

Bobbie wasn't having it. "Because sometimes the thing we don't expect is that we lost Clarissa and Holden. Or that we lost Amos. Or that we lose me. Or Alex. Or you. But that's going to happen. We're all going to lose each other eventually, and that's been true since before we were a crew. That's what being born means. Everything else is just specifics. And my specifics are that I'm leading a top-secret military mission in Sol system using the enemy's captured ship against them, because even if it's a bad plan, it's the only plan I have. And maybe my risk will get you your leverage."

But I don't want you to risk anything, Naomi thought. *I've lost too much. I can't stand to lose anything more.* Bobbie's features softened, just a little. So maybe she understood.

The familiar tap of a footstep outside the door was Alex as clearly as if he'd said his name. Naomi took a deep breath and forced herself to relax.

She didn't want to spoil the reunion for him too.

Chapter Three: Alex

Bobbie and Naomi were at it again.

They played it cool when Alex came back into the room, but he could tell a heated conversation had been going on while he was away. Naomi was dipping her head, letting her hair fall in front of her eyes the way she did when she was upset. Bobbie's face was a shade darker than usual, flushed with excitement or anger. Alex had lived on the same small ship with Naomi for decades, and Bobbie only a little less. There was almost nothing they could conceal from each other.

It hurt his feelings a little that they were even trying to hide it because that meant he had to hide it too.

"All settled up," Alex said.

Bobbie nodded and drummed her fingers on the table. Naomi gave him a small smile through her hair.

Alex would have put money that their argument was the same one they'd been rehashing since they'd left Freehold. Pretending like nothing was wrong was the only safe choice. A wise man doesn't get between two fighting animals, but even a dim bulb didn't step into an argument between Naomi Nagata and Bobbie Draper. Not if he wanted to keep all his fingers. Metaphorically speaking, of course.

"So . . . ," Alex started, letting the word draw out until it became awkward.

"Yeah," Naomi answered. "I've got a lot to do before I climb back into my storage crate."

Bobbie nodded, started to speak, and then stopped. In the blink of an eye she'd crossed the distance to Naomi and swept her up in her massive

arms. While the two women were close to the same height, Bobbie outweighed Naomi by at least forty kilos. It was like watching a polar bear grapple a coatrack. But it wasn't the beginning of a fight, because both women were crying and patting each other on the back.

"It was good to see you," Bobbie said, hugging Naomi a little tighter and lifting her off the deck.

"I miss you," Naomi answered. "Both of you. More than I can say."

The *both of you* felt like an invitation, so Alex moved in and threw his arms around the two of them. A moment later, he was weeping too. After a while, when it felt right, they separated. Bobbie wiped her eyes with a napkin, but Naomi ignored the streaks down her face. She was smiling. Alex realized it was maybe the first real smile he'd seen from her since Holden had been taken to Laconia. It made him wonder how lonely her life was now, hidden away in her cargo container, moving from ship to ship and station to station. Even though it was the choice they'd all made together, he felt a pang of guilt for leaving her alone like that. But Bobbie had needed a pilot, and Naomi, in her wandering-statesman role, didn't. And didn't want one.

"When will we see you again?" Bobbie asked.

"I wish I knew," Naomi replied. "You guys going to be in Sol long?"

"Not up to me," Bobbie said with a shrug. In this case it was true, but even if it hadn't been, the answer would have been the same. You never knew who was listening, and even here on a Transport Union station in the back room of an OPA sympathizer bar, the habits of secrecy died hard.

As if on cue, Alex's hand terminal buzzed an alert at him. They were getting ready to transfer the *Storm* from its current ship to the new one. Naomi wasn't the only one living inside a high-stakes shell game.

"Boss, gonna go oversee the transfer," he said to Bobbie.

"I'll come with," she replied, then grabbed Naomi for one last fierce hug. "You stay safe, XO."

"That's all I do nowadays," Naomi said with a sad grin.

Leaving her behind felt wrong. The way it always did.

Alex would never admit it out loud, but the *Gathering Storm* scared the shit out of him. The *Rocinante* was still his first love. Like a hand tool that grew to fit the shape of the hand that held it, the *Roci* was comfortable, familiar, safe. For all that it was a dangerous warship, it still felt like home. It felt *right*. He missed it terribly.

The *Storm* was like living inside an alien creature that was pretending to be an overpowered racing ship and then someone had strapped a shit-ton of firepower onto it. Where flying the *Roci* felt like a collaboration, the ship an extension of his will, flying the *Storm* felt like a negotiation with a dangerous animal. Every time he sat in the pilot's chair he worried about getting bitten.

Bobbie had gone over the ship with her techs from stem to stern and reassured him that there was nothing in the specs that made the *Storm* dangerous to her crew, or at least not more than *all* spaceships were dangerous to their crews. Alex remained unconvinced. There was something about using the controls that felt like the ship wasn't reacting to his inputs; it felt like the ship was interpreting them and agreeing with them, but also making its own damn decisions. The only person he'd ever confided this to was his copilot, Caspar Asoau.

"I mean, yeah, the controls feel a little loose I guess, but not sure that means the ship is fighting back," Caspar had said, giving Alex a suspicious side-eyed glance. Alex hadn't brought it up again. But Alex had been flying spaceships for a lot of years now, and he knew what he knew. There was more to the *Storm* than just metal and carbon and whatever that crystal-looking shit was. Even if no one else could see it.

Still, it was a damn beautiful ship.

Alex stood at a small observation window and watched as it was carefully moved from the open hangar bay of their old transport ship to the new one. The two massive transports flanked the *Storm* as it moved, and the enormous bulk of the transfer station's central hub overshadowed them both. It was all very deliberately done to block line of sight to all the known

government telescope and radar stations. For all the Laconian Empire would ever know, two heavy freighters had briefly docked at the same transfer point, dropped off or picked up some cargo, and then gone their separate ways. That a stolen Laconian warship had been moved from one to the other wouldn't appear on any official records or in any video feeds. And the *Storm* and her crew would be free to live and fight another day. Assuming they hadn't overlooked anything.

The gleaming crystal-and-metal flanks of the ship seemed to glow with their own inner light even in the box canyon shadow that two freighters and the transfer station created. Bright white puffs of superheated gas flashed and disappeared as the maneuvering thrusters fired. Caspar would be at the controls, gently nudging the Laconian destroyer out of the open cargo bay of their old ship and into the new with practiced ease. They'd played this game a lot, and both pilots had become expert at moving the ship in very confined spaces.

As a former military man, Alex was always surprised that they could actually manage to keep the conspiracy a secret. They were sneaking a stolen imperial warship through the gate network hidden in the bowels of Transport Union ships. At least dozens and maybe hundreds of people were directly involved. Somehow, they kept getting away with it.

The Occam's razor argument to nearly all conspiracy theories was that people were really shitty at keeping secrets, and large groups of people were exponentially worse. But with the help of their former OPA friends in the Transport Union, they'd been sneaking and peeking for months without getting caught. It was a testament to how bred to insurgency the Belters had become over the last century or two. Hiding a rebellion from vastly superior military forces was in their DNA. During his twenty years as a member of the Martian Navy and then later fighting the Free Navy, he'd had a part in hunting their more radical factions. Alex had often found the Belter capacity for subterfuge and guerrilla fighting infuriating. Now it was literally keeping him alive.

Alex wasn't sure if that was ironic or not. Funny, maybe.

The *Storm* finished buttoning down in their new freighter. It was a cow of a cargo hauler shaped like a fat bullet and named the *Pendulum's Arc*. Its doors slid shut and locked, and Alex felt a tiny tremor in the deck as they did. A pair of doors bigger than a destroyer had some mass to them.

Alex pulled out his terminal and opened a channel to Bobbie. "The baby's tucked in. We can be oscar mike on your word."

"Copy that," Bobbie said, and killed the channel.

She was off doing final prep with her team. Saba's chain of whisperers hadn't told them what their mission in Sol was, but Bobbie kept her troops so drilled on the fundamentals that the specific mission just became a checklist of shit to get done. Alex had been skeptical when Bobbie took a mixed bag of old-guard OPA, stuffed them into Laconian Marine power armor, and said she was going to turn them into a legit covert ops strike team. But damned if she hadn't done exactly that. They'd run three different operations with a hundred percent success rate and a zero percent casualty rate. It turned out that as formidable as Gunny Draper was, she was even scarier when you let her train her own backup.

There had to have been a moment when this had become the new normal. Playing their cargo ship version of three-card monte with the *Storm* while Saba and Naomi and the rest of the underground picked mission targets for them. He couldn't say when it had passed. Only now he was back to being the bus driver he'd been in the MCRN a few lifetimes ago. Every day carried the risk of discovery and capture or death. Every operation sent Bobbie and her team into the meat grinder of the Laconian dominion. For all their successes, they were walking on the edge of a razor blade. If he'd been twenty and unaware of his own mortality, he'd probably have loved it.

He turned away from the observation window and picked up his gear bag. As he walked, his terminal squawked at him. "Locked and powered down," Caspar said.

"I was watching. Elegantly done. The gunny will be drilling the troops, and I'm headed that way. Ship's yours for the duration."

"Copy that."

The corridors of the transfer station were spare and functional. Smooth taupe ceramic walls and a floor just padded enough to keep the occupants from getting shin splints in the habitat ring's one-third g rotation. Alex trudged along one for half a kilometer, then rapped at a door marked STORAGE 348-001.

A grizzled Belter opened it a crack and looked up and down the hallway around Alex. He had gray hair in a military-style buzz cut and flat gray eyes of almost exactly the same color. Alex could see the heavy black pistol he held behind his thigh as he checked to see if the corridor was clear. His name was Takeshi Oba, and he was one of Bobbie's killers.

"All clear," Alex said with a smile, and Oba let him in with a grunt.

It was an empty room of about five by ten meters with the same plain ceramic walls as the corridor outside. Bobbie's team was standing in loose ranks facing her as she addressed them. She gave Alex a tiny nod as he entered, but didn't stop her speech.

"Make no mistake," she was saying, "the Sol system is the most dangerous theater we've operated in. Its threat level is second only to Laconia for our style of covert op. Nearly every rock or chunk of ice bigger than a troop transport has a station, telescope, or radar emplacement on it. There are eyes everywhere."

A mutter passed through the group, but Alex couldn't tell if it was grumbling or agreement.

"And," Bobbie continued, "the Earth-Mars Coalition fleet is entirely under Laconian control. Which means the Laconians' relatively small number of ships—the one fact that has allowed us to operate up to this point—is *not* going to help us here. To make matters worse, the Laconians have left the dreadnought *Heart of the Tempest* in orbit around Earth. It's there primarily as a threat to keep the inner planets in line, but if it detects us, we are in a world of hurt. The *Storm* cannot survive an engagement with a *Magnetar*-class battleship. End of story."

"Any word yet on the target?" Jillian Houston asked. She was the daughter of Freehold's governor, Payne Houston, and had been one of the first volunteers for Bobbie's team. She was tall and rangy, with white-blond

hair, the muscles and bone structure of a born Earther, and a perpetual scowl line between her eyes. She'd become Bobbie's unofficial second in the time they'd worked together. Alex worried about that. Jillian was mean as a snake. When he'd told Bobbie that, she'd responded, *I just make sure she never runs out of mice*. He still didn't know quite what that meant.

"No. The kids upstairs are playing this one close to the vest," Bobbie said. "It's starting to feel like we'll know when we're already doing it."

"Outstanding," Jillian said.

"The *Storm* is buttoned up, and we'll be heading Solward on the *Pendulum* in thirty hours," Bobbie said. "Enjoy your time on Paternity Row, but make sure you're on the ship and squared away twenty-four hours from now or find my foot uncomfortably up your ass."

That drew a good-natured chuckle from the crowd.

"Dismissed."

A few chaotic moments later, Bobbie, Jillian, and Alex were the only three left in the room. Bobbie still wore the nondescript flight suit she'd had on when they met with Naomi, but Jillian wore the black jumpsuit adopted by Bobbie's strike team as its unofficial uniform. She also had a large pistol in a holster. Alex had never seen her without it. For Freeholders, wearing a gun was like wearing pants.

"I don't like Saba giving us the runaround on this," Jillian said. "It feels like he's fucking improvising."

"There could be a lot of legitimate reasons why the mission details are still being formulated," Bobbie replied. Her voice was gentle, but firm. *I understand your concern, but do it anyway* was implicit in it.

"It has to be Callisto," Jillian continued as if she hadn't heard the quiet warning in Bobbie's tone. "Only thing worth a damn that's far enough away from that battleship to be a realistic target."

Bobbie took a half step toward her and straightened up, magnifying the size difference between the two women. Jillian stopped talking, but didn't back down at all. *Mean as a snake, and with giant brass balls*, Alex thought.

“That sort of speculation is unproductive. And, frankly, dangerous,” Bobbie said. “Keep it to yourself. Go get a drink or five. Get in a bar fight if you have to. But get it out of your system and be back at the *Storm* tomorrow. We’ll know more then.

“Dismissed.”

Jillian finally seemed to get the message. She threw Bobbie a half-mocking salute and sauntered out of the room.

Alex opened his mouth, and Bobbie pointed her finger at him. “Don’t fucking say it.”

“Copy that,” he said instead. “A day on station with nothing to do. Wish Naomi was hangin’ around. Could’ve done more than eat shitty kibble with her.”

“She’s got her mission too,” Bobbie said. Her lips pressed thin and pale.

“So,” Alex said, “you gonna tell me what went on between you, or am I gonna have to beat it out of you?”

Caught off guard, Bobbie let out a bark of laughter just the way he’d hoped she would. It was like a Chihuahua threatening an office building, and Alex grinned to show he was in on the joke.

Bobbie sighed. “She still thinks we should negotiate our way out of this. We disagree on that point. Same shit, different year.”

“She’s lost a lot,” Alex said. “She’s afraid of losing it all.”

Bobbie grabbed Alex’s upper arm and gave it an affectionate squeeze.

“And that’s the point I keep trying to make with her, my friend. In a fight like this, unless you’re willing to lose everything to win, you lose it all by losing.”

Chapter Four: Teresa

We don't know what they called themselves," Colonel Ilich said, lying back on the grass, his hands pillowing his bald head. "We don't know that they called themselves anything, really. They may have done without language at all."

Teresa had known Colonel Ilich her whole life. He was a fact of the universe, like stars or water. He was a calm, thoughtful presence in a life full to spilling with calm, thoughtful people. What made him different was that he was entirely focused on her. That, and that he wasn't afraid of her.

He shifted, stretched. "Some people call them 'the protomolecule,' even though that was really just a tool they made. It'd be like calling humans 'wrenches.' 'Protomolecule engineers' is closer, but it's kind of a mouthful. 'Initial organism' or 'the alien society' or 'the architects.' They all get used to mean more or less the same thing."

"What do you call them?" Teresa asked.

He chuckled. "I call them 'the Romans.' The great empire that rose and fell in antiquity, and left their roads behind."

It was an interesting thought. Teresa turned it over in her mind for a few seconds like she was getting the taste of it. She liked the analogy not because it was accurate, but because it was evocative. That was what made analogies useful. Her mind wandered down that rabbit hole for a few breaths, seeing what was there, what was interesting in it, and decided to ask Timothy what he thought. He always had views that surprised her. It was why she liked him. He wasn't afraid of her any more than Colonel Ilich was, but Ilich's respect tasted like respect for her father, and that made it . . . not *lesser* exactly. Just different. Timothy was hers.

She felt the quiet stretching on too long. Ilich would be expecting her to say something, and Timothy wasn't something she talked about. She found

something else.

“So they built all of this?”

“Not all of it, no. The gates, the construction platforms, the repair drones. The *artifacts*, yes. But the living systems existed on the other worlds first. Stable replicators aren’t as rare as we used to imagine. A little water, a little carbon, a consistent stream of energy from sunlight or a thermal vent? Add a few million years, and more often than not something will happen.”

“Or if it doesn’t, then the Romans don’t have anything to work from.”

“One thousand three hundred and seventy three times that we know of,” Ilich said. “That’s a lot.” The colony worlds—Sol system included—were only on the gate network because there had been life for the Romans to hijack. A few hundred systems in a galaxy of billions. Ilich was old enough that anything more than one was miraculous to him. Teresa hadn’t grown up in a lonely universe the way the colonel had. She’d grown up in a lonely universe the way *she* had, and the two didn’t compare.

She closed her eyes and turned her face toward the sun. The light and heat felt good on her skin. The brightness pressed through her eyelids, turning everything red. Nuclear fusion filtered through blood.

She smiled.

Teresa Angelica Maria Blanquita Li y Duarte knew that she wasn’t a normal child the way she knew that light reflected off a level surface became polarized. A not-particularly-useful academic fact. She was the only daughter of High Consul Winston Duarte, which all by itself meant her childhood had been strange.

She’d lived her whole life in—or occasionally and clandestinely just outside—the State Building on Laconia. Since she’d been a toddler, other children had been brought in to be her friends and classmates. Usually from the most favored families of the empire, but sometimes because her father wanted her to know a variety of kinds of people. He wanted her to have as close as she could get to a normal life. To be as close as she could be to a normal fourteen-year-old. And it worked as well as it worked, but since she only had her own life to judge from, she couldn’t really say how successful it had been.

She felt more like she had friendly acquaintances than actual friends. Muriel Cowper and Shan Ellison particularly treated her best, or at least most like they treated other students in her peer group.

And then there was Connor Weigel, who had been in her classes almost as long as she'd had them. He had a special place in her heart that she found herself curiously unwilling to examine.

If she was lonely—and she assumed she was—she didn't have anything to compare it against. If everything in the world was red, no one would know it. Being everywhere was just as good a way to be invisible as not being anywhere. It was contrast that gave things shape. Brightness made darkness. Fullness made emptiness. Loneliness defined the borders of whatever not-loneliness was called. They were comparative.

She wondered if life and death were like that too. Or life and not-life, anyway.

"What killed them?" she asked, opening her eyes. Everything looked blue. "Your Romans, I mean."

"Well, that's the next step, isn't it?" Colonel Ilich said. "Figuring that out and then building a strategy around what to do about it. We know, whatever it is, it's still out there. We've seen it react to things that we do."

"The thing on the *Tempest*," Teresa said. She'd seen the briefing on it. The first time Admiral Trejo used the *Magnetar*-class ship's main weapon in normal space, something had happened that knocked out people's consciousness all through Sol system for a few minutes and left a visual distortion on the ship itself, locked to its frame of reference. It was why James Holden had come to the palace, which was really the aspect of it that had the biggest impact on her.

"Exactly," Ilich said. He rolled onto his belly and propped himself up on his elbows to look at her. Eye contact was how he signaled that something he said was important. "It's the most serious threat to our security. Either the Romans died because they ran up against some natural force that they weren't prepared for, or because an enemy killed them. That's what we're finding out first."

"How?" she asked.

“We don’t know how they killed the Romans. We’re still just at the edge of understanding what they were compared to us.”

“No. I mean how are we finding out if it was an enemy or a natural force?”

Colonel Ilich nodded to say it was a good question. He pulled out his handheld, tapped on it a few times, and brought up a grid.

	TERESA COOPERATES	JASON COOPERATES
JASON DEFECTS	T3, J3	T4, J0
TERESA DEFECTS	T0, J4	T2, J2

“Prisoner’s dilemma,” Teresa said.

“You remember how it works?”

“We both decide without talking whether to cooperate or defect. If we both cooperate, we both get three points. If only one of us cooperates, they don’t get any points and the defector gets four. If we both defect, we both get two. The problem is that no matter what you choose to do, I’m better off defecting. I get four instead of three if you cooperate or else two instead of nothing if you defect. So I should always defect. But since the same logic applies to you, you should always defect too. And then we wind up both making fewer points than if we’d cooperated.”

“So how do you fix that?”

“You don’t. It’s like saying ‘This statement is false.’ It’s just a hole in logic,” Teresa said. “I mean . . . isn’t it?”

“Not if you play it more than once,” Colonel Ilich said. “You play it over and over and over for a really long time. Every time the other player defects, you defect the next time. And then you go back to cooperating. It’s called tit for tat. There’s a pure game theory analysis of it I can give you if you want, but you don’t need it for this.”

Teresa nodded, but slowly. Her head was thick, the way it got when she was thinking about something without quite being conscious of what it was. Usually something interesting came up shortly afterward. She liked the feeling.

“Think of it like you were training Muskrat back when she was a puppy,” Ilich said. “The puppy wets the rug, and you scold it. You don’t go on scolding it forever. Just once, when it happens, and then you go back to playing with it and petting it and treating it like a puppy. It defects, then you defect, then you go back to cooperating.”

“Until it figures out that there’s a better strategy,” Teresa said.

“And it changes its behavior. It’s the most basic, simplest way we can negotiate with something we can’t talk to. But what if you do the same thing with the tide? Punish the waves for getting the rug wet?”

Teresa scowled.

“Exactly,” Colonel Ilich said as if she’d spoken aloud. “If you scold the tide, it doesn’t matter. It doesn’t care. It doesn’t learn. And most of all, it doesn’t change. Your father is going to play tit for tat with the force that killed the Romans. And we’re going to see if it changes its behavior. If it doesn’t, we’ll take the hypothesis that they ran up against a law of nature like gravity making tides or the speed of light. Then we can study it, and find ways around it. But if it *changes* . . .”

“Then we’ll know it’s alive.”

“That’s the difference between exploration and negotiating,” Colonel Ilich said, pointing at her. She felt the bloom of pleasure that she always got when she’d answered a knotty problem well, but something nagged at her.

“But it *killed* the Romans.”

“War’s a kind of negotiation too,” he said.

Teresa’s rooms were in the north wing of the State Building, as were her father’s. It was the only home she’d ever had. A bedroom built to military specifications, a private bathroom, and the room that had been her playroom and was now her office, the difference being mostly cosmetic. When she’d

been ready to strip away the decorations of cartoon dinosaurs and puppies, she'd said so, and the next day a designer had come to help her choose a new color scheme and layout. Her corner of the State Building wasn't large or ostentatious, but it was hers to customize and re-create. Her little bubble of autonomy.

She'd chosen to make the office look like a science station. Her desk was tall enough to stand at, but also had long-legged stools along the side if she chose to sit. The east wall was a single screen set to run animations of simple mathematical and geometrical proofs when she wasn't watching a news or entertainment feed. It wasn't that she understood all the math, but she thought it was pretty. There was an elegance to the proofs, and having them there made her more aware of her intelligence. She liked being aware of her intelligence.

But she also had a couch long enough that she could lie down on it and still have room for Muskrat, her Labrador, to curl up at her feet. And a real glass window that looked out over a ceremonial garden. There were whole days when, if she wasn't with Colonel Ilich or in class, she'd curl up on the couch with Muskrat and read books or watch films for hours at a time. She had access to everything the censors approved—her father was very liberal about giving her access to literature and film—and she gravitated to stories about girls who lived alone in castles or palaces or temples. For such a specific genre, it turned out there were quite a few.

Her present favorite was a ten-hour feed made on Mars back before the gates opened called *The Fifth Tunnel*. In it, the hero—who, at twelve, was now younger than Teresa, but had been older when she first watched it—discovered a secret tunnel under a city called Innis Deep and followed it to a whole buried community with elves and fairies who needed help getting back to their dimension.

It all seemed wildly exotic, and the idea of a girl who lived her whole life underground captured her imagination so much that she'd put a blanket over her windows and pretended that the darkness was made of Martian dirt. When her father told her that part was true—that there was an Innis Deep and that Martian children did live in tunnels and buried cities—and that only the elves and fairies were inventions, it had astounded her.

She was watching it again when her father came by. She'd just gotten to the part where the girl—whose name was never mentioned—was running through a dark hallway with the evil fairy called Pinsleep chasing her, when the knock came. She was just getting up to answer it when the door opened. Only her father opened the door. Everyone else made her get it.

The treatments had changed him over the last few years, but just growing up had changed her. It didn't seem weird. His eyes had developed more of their oil-on-water shimmer in the whites and his fingernails had gone darker at the cuticles, but that was all just looks. In every way that mattered, he was the same.

"Am I interrupting?" he asked, the way he always did. It was half a joke, because she didn't have anything to interrupt, but only half. If she'd ever said yes, he would have let her be.

The nameless girl shrieked as Pinsleep lunged for her. Teresa paused the feed, and prey and predator both froze. Muskrat huffed, tail thumping against the couch as her father scratched the dog's wide ears.

"I have a briefing in two hours," he said. "I'd like you to attend."

Teresa felt a little prick of annoyance. She'd meant to go out and visit Timothy as soon as the feed was done. If they'd found out she was leaving the grounds without permission . . .

"Did I do something wrong?"

Her father blinked, then laughed. Muskrat pushed her head up into his hand, demanding more attention. He went back to rubbing her ears. "No, not at all. It's Admiral Waithe's report on the expansion plan for Bara Gaon Complex. You aren't expected to contribute, but I'd like you to listen. Then afterward, we can talk about it."

Teresa nodded. If it was what he wanted, of course she could, but it sounded dull. And strange. Her father's eyes went unfocused for a moment, the way they did sometimes, and then he shook his head like he was trying to clear it. He leaned against the arm of the couch, not quite sitting but not standing either. He tapped Muskrat's side firmly twice in a way that meant petting time was over. The dog sighed and flopped her head down on the cushion.

"Something's bothering you," he said.

“You’ve been asking me to do this more often,” she said. “Am I doing it wrong?”

His laughter was warm, and it made her relax a little.

“When I was your age, I was pushing for early entrance to upper university. You’re like me. You learn fast, and I want to keep up with you. I’m bringing you in more because you’re old enough to understand things now that you weren’t able to when you were a child. And Colonel Ilich says that your studies are on track. Even advanced.”

She felt a little glimmer of pride in that, but also confusion. Her father sighed.

“It’s hard work, keeping people safe,” he said. “Part of that is that we’ve come up against very dangerous, unknown things. I can wish that weren’t the case, but I can’t take it back. And the other part is that we’re working with people.”

“And people are terrible, terrible monkeys,” Teresa said.

“Yes, we are,” her father said. “We have a very close horizon almost all the time. Including me. But I’m trying to get better.”

The way he said it, he sounded tired. She leaned forward, and Muskrat took it as a sign that she was looking for someone to pet. She shifted, breathing hot on Teresa’s face until she gently pushed the dog back.

“Is the Bara Gaon Complex expansion really important, then?” Teresa asked.

“Everything’s important. All of it,” her father said. “And so every part of it needs to be able to fail without destroying the whole project. Including me. Which is why I’ve been asking you to come to the briefings more often.”

“What do you mean?” she said.

“I’m fine,” her father said. “Everything’s fine. There isn’t a problem. It’s only that . . . if there were to be, sometime later. Decades from now. Someone would need to understand the shape of the whole plan, and be able to step in. And people trust what they already know. Having a new high consul would be difficult under any circumstances, but it would be less difficult if there were a story with it. A succession. I want to train you to be that, if—God forbid—something happened to me.”

“But why should I be good at it just because you were?” Teresa said. “There’s no reason to think that. That’s dumb.”

“It is,” her father said. “But it’s a mistake people have made all through history. And since we know that, the two of us can use the tool we’ve been given. Come sit in the briefings and the meetings. Listen. Watch. Talk to me afterward. This is the next phase of your education. So that if you need to step in, you’ll actually be the leader they need you to be.” It took a few seconds to really understand what he was saying. The huge moments in life seemed like they should have more ceremony and effects. The important words—the life-changing ones—should echo a little. But they didn’t. They sounded just like everything else.

“You want to train me up to be the next high consul?”

“In case something happens to me,” Duarte said.

“But just in case,” she said. “Only just in case.”

“Just in case, princess,” he said.

Chapter Five: Elvi

A few decades earlier and about two hundred thousand trillion kilometers from where she currently sat, a tiny node of active protomolecule in a biological matrix had entered the orbit of a planet called Ilus, hitchhiking on the gunship *Rocinante*.

As the uncanny semisentient intelligence of the protomolecule tried to make contact with other nodes in the gate builders' long-dead empire, it woke up mechanisms that had been dormant for millions—or even billions—of years. The end result had been an ancient factory returning to life, a massive robot attack, the melting of one artificial moon, and the detonation of a power plant that nearly cracked the planet in two.

All in all, a really shitty experience.

So when Elvi's team took the catalyst out of isolation in unexplored systems to do a similar if slightly better-controlled reaching out to the artifacts and remains, she made sure they were careful. They watched what happened, they were ready to put the catalyst back in its box, and they didn't get too close to anything.

"*Falcon* in position," the pilot said.

If anything went terribly wrong, the pilot or Sagale or Elvi could give a single spoken order—*Emergency evacuation*, their name, and the delta-eight authorization code—and the ship would take it from there. Given the *Falcon*'s oversized engine and massive acceleration, anyone not in one of the ship's specially designed high-g couches would be injured or killed, but the data they'd already collected would be preserved. Laconia had a lot of fail-safe logic like that. It wasn't her favorite part of the job.

“Thank you, Lieutenant,” Admiral Sagale replied. He was strapped into a crash couch on the bridge too. Another sign of how seriously everyone took this part of the mission. “Major Okoye, you may proceed.”

“Take her out,” Elvi said into the comm. In this situation, there was only one *her*.

Elvi sat in her custom Laconian crash couch, surrounded by screens. The instruments could be yanked away in under a second, and the couch chamber filled with a breathable fluid for high-g burn shortly after. She was one of the few people important enough that efforts would be made to keep her alive. It felt like working inside a torpedo. She kind of hated it.

On one of her screens, a camera tracked the movement of the catalyst as she was wheeled out of her storage room on a high-tech gurney covered in sensors. Protomolecule communication went both ways. What happened to their sample was just as important to their study as what happened to the dead system that they might be about to activate.

The catalyst’s gurney moved on magnetic wheels down the corridor to a compartment in the skin of the ship, away from all the radiation shielding and whatever high-tech wizardry Cortázar’s team had come up with to lock their sample away from the rest back beyond the gate.

Nothing happened.

“No response yet,” Travon said.

“Gee, really?” Fayez replied, the sarcasm in his tone meant for everyone else. Travon wouldn’t hear it.

While the protomolecule might communicate in ways that looked like they were faster than light once it got going, it didn’t start it right away. Since locality wasn’t a big deal for the protomolecule, but the speed of light was, Elvi suspected it was some slower-than-light handshake as the two network nodes agreed on the protocol to be used. That was somewhere between a guess and a metaphor, but it helped her to think about it.

Her sample came out of Cortázar’s laboratory pens. It hadn’t existed until the recent past. Everything they were trying to interact with here had been waiting since humanity had been a kinky idea that two amoebas came up with. So somehow, when her node came into physical proximity—

meaning somewhere in the same solar system—for the first time, they were creating some kind of relationship to each other on the fly. Which was awesome, but also weird. And not how quantum entanglement worked, unless somehow it was.

In her study of the protomolecule and the civilization that had created it, Elvi often found herself glad she wasn't a physicist. What the protomolecule did biologically, while not entirely explicable yet, at least seemed like it might be fully understood some day. The mechanisms by which it hijacked life and repurposed it were incredibly advanced, but not totally dissimilar to things like viruses and parasitic fungi. She didn't understand all the rules yet, but she felt like she could, given enough time and research.

What the protomolecule did to physics looked less like a variation and refinement of the standard models and more like kicking the game table over and scattering the pieces across the floor. Elvi wondered if Jen Lively's constant lighthearted joking was so she didn't go insane as her understanding of reality was ripped to shreds in front of her on a daily basis.

"Getting a reaction," Travon said.

"Yeah," Jen agreed. "Something's happening in the object."

"What was the delay on that?" Elvi asked.

"Eighteen minutes."

They were nine light-minutes from the structure, so that made a handshake propagating at or near c plausible. She really needed to write that hypothesis up and run it past the nanoinformatics staff.

Elvi's screens went wild with readings from the catalyst's sensor package. It was too much data to be analyzed in real time, so Elvi let it wash over her like a wave of numbers and graphs. There would be plenty of opportunity later to figure out what it all meant.

"Looking stable so far," Travon said.

"Always glad when things don't immediately blow up," Elvi said, but no one laughed.

"You know what makes a diamond green?" Jen asked everyone and no one. "I looked it up."

“Radiation,” Fayez said. Of course he knew. He’d been on the Ilus team too, as its geologist. While the opening of the protomolecule gate network had given Elvi more than thirteen hundred new biospheres to study, it had given Fayez ten times that many new geologies to explore. Some of them as exotic as a great huge lump of carbon crystal that was a really pretty color. “Diamonds that form in the presence of radiation can get that green color. Some people mistake them for emeralds. But totally different mineral. Emeralds are beryl, not carbon.”

“Stealing my thunder there, sport,” Jen said. “But I’m betting it means that this star was a lot more active when the object was formed. My best guess, based on stellar decay, is that the object is almost five billion years old. That’s been hanging out for about a third of the time the universe has, you know, *existed*.”

“That would make it one of the oldest artifacts we’ve found,” Travon said, suddenly interested. “Maybe something from the very beginning of their civilization.”

“Fascinating,” Sagale said, his clipped tones the only sign of his impatience. “What’s it doing?”

What’s it doing that helps us fight ghoulies from beyond time and space? was the implied question. For all her bottomless budget, for all the cream-of-the-crop science teams she’d been given and her custom-built state-of-the-art ship, there was only one result the high consul and his Science Directorate cared about. *How do we stop the things that eat ships passing through the gates?*

“I don’t know,” she said. “Let me take a look.”

Eighteen hours into their data collection, Elvi retired to her cabin. She’d learned early on that the military discipline of the Laconians didn’t extend to forcing people to work on no rest. Duarte wanted everyone at peak efficiency. Baked into that was the idea that most people would spend a

third of their day sleeping. When Elvi climbed out of her couch and said she needed to rest before she began her analysis, Sagale didn't bat an eye.

It was a trick she'd started using to buy uninterrupted work time. She'd been able to go twenty-four hours straight since grad school. Some caffeine tablets and hot tea, and she could go forty-eight if she needed to. Not sleeping bought her eight or nine hours without Sagale's questions about results and timetables.

But the gag only worked if everyone pretended that she actually was sleeping, so for Fayez to burst in meant he had something big.

"It made a copy."

Before Elvi could ask what had made a copy and what it had made a copy of, he'd floated over to the dining table in the middle of her cabin and slapped his terminal down on it. The electromagnetics in the table kept the terminal from floating away, but the impact sent Fayeze tumbling gently toward the wall. He was an Earther, born and raised, and no matter how much time he spent in space, he never seemed to lose that instinctive expectation of gravity. As he drifted away, he yelled at the table, "Show her! Show her . . . the thing! Display last file, volumetric display."

A holographic map of what looked like a human brain appeared, floating above the table. The brain sparked with flashing synaptic paths, probably an fMRI or fNIRS scan. Elvi had seen this particular brain often enough to know it belonged to the catalyst. That it had been a woman, once upon a time. Fayeze hit the bulkhead and pushed off with one foot, rejoining her at the table.

"A lot of activity," Elvi said. "But taking her out of her pen might be causing her stress, or physical discomfort. Nothing here is all that unusual."

"That's just her being her," Fayeze said, shaking his head and tapping away at his terminal. "Look at this."

A second image appeared. It took Elvi a moment to recognize that it was a copy of the catalyst's brain activity, but without the physical structure of the brain.

"I don't understand. What's that second image from?"

"That," Fayeze said with a grin, "is coming from the object."

“What, the whole thing is mirroring her brain activity?”

“No, it’s very localized,” Fayeze said, and tinkered with the controls. The second image zoomed out for a long time until the entire object was in view. A tiny white dot appeared. “That dot is not to scale, of course. It’d be the size of Greenland at this distance. But that’s the approximate location of the image.”

He tapped some more, and the image was replaced with long strings of sensor data. “Jen started picking up some EM fluctuation in the surface of the object. I mean, in context it’s tiny, but the object is totally inert, and the sensors on this boat are as sensitive as a galactic tyrant’s money can buy.”

“Okay,” Elvi said. “What does she think we’re looking at?”

“At first it just looked like some photons bouncing around, until Jen put together this map. No one knew what we were looking at until Travon said, ‘Hey, that looks like an fMRI.’ I pulled up the catalyst’s monitor, and boom, there we were.”

Elvi didn’t mind space, but the one thing it lacked that she needed right then was the ability to collapse into a chair. She felt a rush of adrenaline that made her hands tingle and her legs go numb.

“So they’re echoing each other?”

“Like looking in a mirror.”

“Oh,” she said. Then, “Okay. That’s huge.”

“Oh, it gets huger,” Fayeze said. “All across the object we’re now seeing radiation hotspots”—he zoomed in on one, and a new rush of numerical data splashed across the image—“like this.”

He was looking at her expectantly. Waiting for her to make the connection. She didn’t think she was all that tired, but whatever flash of insight he was looking for just wasn’t there.

“I give up.”

“It took us a minute too,” Fayeze said. He pulled up a third image. Elvi recognized a ring gate. “This is the same kind of radiation that sprays out of the gate during a transit.”

Almost before the numbers hit her screen Elvi had it. “That correlated to the catalyst.”

“Yes. Catalyst brain, green diamond-thing copy, and weird distributed gate-like radiation. Three things, all with the same pattern,” Fayez said.

Elvi pulled the image of the huge green diamond back until she could see the whole thing at once. It seemed to flicker with tiny stars of light appearing and disappearing where the computer marked the radiation spikes for her.

“This thing is filled with . . . gates? Like, in the physical structure of the object itself?”

“We have a theory,” Fayez said. He was grinning like he had the first time she agreed to sleep with him. He was a goofball, but she liked what made him happy: knowing things, and her.

“It’s too early for theories,” she said.

“I know, but we have one anyway. And by we, I mean Travon first, but we’re all on board. This thing comes in contact with a protomolecule-infected mind, it makes a copy of that mind, then these gate signatures start showing up all over the object. Travon starts talking about how secure data storage works. You take the physical imprint that’s the encoded data and you scatter it. You put it in a bunch of discrete storage locations with tags and code built in so that if any portion of the storage system is lost, the rest of it knows how to rebuild the lost portion from the scattered fragments.”

Elvi, who was a lot more computer literate than Fayez, started, “That’s not exactly—”

“So then Jen says, ‘A diamond is a super-dense and incredibly regularly structured mass of carbon atoms. If you had a way to shift things around without damaging the overall structure, it’d make a great data storage material.’ ”

Elvi paused, her mind ticking through the implications.

“A way like tiny, tiny wormholes,” Elvi said.

“Right? We know that the protomolecule builders seem to have had a hive mind. Or one brain. However you want to parse that. Instantaneous nonlocalized communication across all the various nodes and entities, all across their corner of galaxy. But shit happens, even to them. Asteroids hit planets or earthquakes or volcanoes or whatever. Anything that’s stored in a

single node is lost forever when that node is destroyed. So what if what we're looking at is the backup drive for their entire civilization? Everything they ever knew, packed into a carbon lattice the size of Jupiter?"

"That," Elvi said, "is one gigantic fucking logical leap."

"Yeah." He nodded, but his grin remained undiminished. "Totally unfounded. Complete guesswork. We'll need generations of scientific studies to verify what this thing is, and then generations more to crack the code on how to dig out the data, if any such data exists."

"But Els," he said, almost breathless with excitement. "I mean, *what if?*"

Admiral Sagale floated beside his desk, looking over navigational charts on a large wall display. Elvi could see a course plotted from their current position, through the Kalma gate and into the hub, then out again through the Tecoma gate and into the next dead system on their galactic tour.

"Tell me that this system is the most important scientific discovery of all time," Sagale said, not even looking up when she floated into his office.

"It might very well—" Elvi started.

"But the big crystal flower in Naraka system was the most important discovery."

"It was an astonishing artifact," Elvi agreed. "But compared to—"

"Before that, it was the trinary star system in Charon, and the planet where it rained glass shards."

"That was more just really cool. You have to admit, it was pretty spectacular."

He turned to give her his full attention.

"I'm hearing you say—*once again*—that there are artifacts in this system that are critical to future investigation," Sagale said. He seemed weary, and vaguely disappointed. "Just like the big crystal flower."

Elvi went through it for him, and as she said it, Fayez's theory seemed more and more plausible. Sagale stared at her through half-closed eyes as

she spoke. When she told him that the diamond outside might actually house every piece of information the gate network builders had ever had, a muscle in his cheek twitched, but that was his only sign of surprise.

“That is interesting. Please write up that theory and include it with the data dump when we send everything back to Laconia during the transit. I apologize for lumping this in with the flowers and glass rain. This actually does seem impressive.”

His grudging admission stung a little, but she let it go.

“Sir,” Elvi said. “Met, this might be everything the high consul sent us on this mission to find. This might be it.”

“It is not,” Sagale said, but she pushed on.

“I strongly encourage you to send word back to the admiralty asking for more time. There are a thousand more tests we can be running while we wait for additional personnel and ships to join us. Leaving now gains us nothing.”

“And you believe you will be able to access this data if I give you that time?” Sagale said.

Elvi almost lied, hungry for the chance to stay a little while longer and learn a little bit more, but . . .

“No. I can’t say that. In fact, it will almost certainly be the work of decades, maybe centuries, to solve this problem. If it even is solvable. But this is our best shot. Nothing we find in Tecoma will be as important as this. I feel pretty safe guaranteeing that.”

“Then we’ll keep to our schedule, and see whether you’re right,” Sagale said, already turning away. “Get secured. We burn for Tecoma in eighty minutes.”

Seventy-eight minutes later, Elvi lay in her crash couch, waiting to drown.

The problem with space travel had always—from the very beginning—been the fragility of human bodies. In spite of these limitations, humanity had done itself pretty proud even before Laconia. Now they were improving by leaps and bounds. The *Falcon* could make the travel time from one system to another almost trivial by comparison to the standard science

vessels and freighters of the civilian fleet. A journey of weeks could be accomplished in days. The *Falcon* would even give most of Duarte's military ships a run for their money. But the price of all that acceleration was the full-submersion crash couch. A diabolical device that completely surrounded the human body in shock-absorbing gel, and filled the lungs with highly oxygenated fluid to make the chest cavity as incompressible as possible. For days.

"I don't understand what he wants," she said.

"He is a complicated man," Fayez said from the couch next to hers.

"It's like he doesn't want us to find anything interesting. Every time we do, he gets grumpy."

"You took your preflight meds?"

"Yes," she said, even though she wasn't sure she'd actually remembered to. They weren't critical. "I feel like he's got some other agenda he's not telling us."

"Almost certainly because he's got some other agenda he isn't telling us," Fayez said. "That can't be surprising, Els."

"It can't be something more important than this," she said. "What would be more important than this?"

"To him? I don't know. Maybe he just hates learning. Traumatized by a science fair when he was young. Ten seconds. I love you, Els."

"I love you too," she said. "I remember when juice was something they injected you with, not something you breathed. I remember I didn't like it at the time."

"Price of progress."

She was looking for something clever to say back, but then the fluid poured in the way it always did and silenced her.

Chapter Six: Alex

The *Gathering Storm* was the absolute state of the art in Laconian naval technology. The first ship of her class to be fielded, she was intended to be the prototype of an entire fleet of fast attack destroyers that could patrol the many systems of the gate network and project Laconian power to every corner of the empire. She had a keel-mounted rail gun capable of firing a three-and-a-half-kilo slug every five seconds at velocities that would punch a hole through smaller moons. She had two separate batteries of torpedo launchers with four rails on each and a fast reload system that could have another eight fish in the tubes and ready to fire less than seventy seconds after the first barrage was let loose. She was defended on all sides by a network of twelve rapid-fire point-defense cannons, and every angle of approach on the ship was covered by at least four of them. She was, as Alex's copilot Caspar liked to quip, a couple thousand tons of fuck-up-your-day stuffed into a five-kilo sack.

Nestled inside the massive cargo hold of the *Pendulum*, she was also defenseless.

Sitting in the pilot's couch, waiting for the go signal, and knowing that if someone realized they were there and started firing he wouldn't even be able to see it on radar made Alex's scalp itch. The *Pendulum* fed them her scopes, so they weren't completely blind, but she was a lumbering heavy freighter. Her threat detection was mostly so she didn't run into a stray hunk of rock. The low-res radar and grainy telescope shots he had to look at did little to calm his nerves.

"So you and the boss go way back, right?" Caspar said.

He sat second couch on the *Storm*, behind and to the right of Alex's chair. Caspar Asoau was a short, skinny kid with a motion tattoo of a running cheetah on one shoulder and the wispiest hint of a goatee. In spite of looking way too young for the job, he was a hell of a good pilot. Quick to obey an order and perfectly charming company. Alex had rapidly discovered that they had nothing in common outside of a love of flying, so other than a casual greeting, the only time they ever seemed to talk was sitting at the *Storm's* controls.

Alex didn't hold it against the kid. He remembered being a young pilot and trying his hardest to hide his nervousness by chatting up the older officers.

"Yeah. The gunny and I have known each other for a long damn time."

"See, that's funny. She's the captain of this ship, but you guys all call her Gunny. That was a rank or something, right? Back on Mars?"

"Something like that," Alex replied. "She'll always be Gunny to me."

Caspar was running the preflight as he talked, fingers tapping softly on the screens. On Alex's monitor the checklist rolled past, each system verified and reporting green before Caspar moved on to the next, with Alex giving the final okay to his work. His copilot was thorough and efficient. He took his job seriously. It kind of made Alex wish the kid were thirty years older so they could be friends.

"She give you any hint on what this op is about?" Caspar asked, then threw the weapon stores inventory to Alex's screen for his double check.

"I show two hundred slugs in the rail-gun mag, eighty fish in the pipes, all PDCs show green and full," Alex said, sliding his finger down the inventory list as he went. "And no, she's an old operator. Keepin' your mouth shut gets drilled into those guys pretty hard."

"Copy, two hundred in the rail gun, eighty torpedoes, PDCs full and greens across the board, verified," Caspar said. "Yeah, but I figured since you guys were friends, maybe she gave you some kinda heads-up."

"She did not. And I wouldn't ask. We'll know when we need to know, and that's good enough for me," Alex said, then, with the preflight complete, spun his couch around to face Caspar. "It's okay to be nervous."

Caspar nodded. He didn't look embarrassed at all to be discussing his fear. Alex felt another little rush of affection for him. He was a good kid. Alex hoped he'd make it through to the other side of the Laconia business, but the odds on that were pretty short for all of them.

"I knew a guy on Pallas," Caspar said. "It wasn't like we were tight. We never seriously dated or anything. But when I'd go through the station on cargo runs, we'd hook up. Ben Yi. I liked him." A tear formed at the corner of his eye and then failed to be pulled down his cheek in the gentle quartering burn of the *Pendulum's* drive.

"He didn't make the evacuation?"

"Nope," Caspar said, then wiped his eyes. "They say that the *Tempest* turned the station into rubble so fast no one would even have seen the actual attack coming. I guess, if you have to go, that's not the worst."

"I'm sorry," Alex said. Everyone on the *Storm* had their reason to hate the Laconians. Everyone had a story. The only answer for most of them was *I'm sorry*. It felt pretty limp.

"If this op gets blown up," Caspar said, turning his attention back to his screens and going through his checklists one more time, "I want you to know. You don't have to worry about me. If that big bastard *Tempest* comes after us, the only thing I'll be thinking is how can I make a hole in it."

"I know, man," Alex said, then patted the kid's knee before turning around. "No doubts."

"Kamal?" said Bobbie's voice in his ear, where the comm bud was inserted. Bobbie only called him Kamal when they were on an op and other ears were listening. It meant go time.

"Kamal copies from the flight deck, Cap," he replied, sitting up straight in his couch. From the hiss of the gimbals behind him, he knew Caspar was doing the same. Even the crash couches on the *Storm* sounded slick.

"I need a go, no-go for deployment," Bobbie said. "*Pendulum* cuts us loose on your word."

"We are all greens up here on the flight deck, go on your command."

"Outstanding," Bobbie said. "Okay, kids, word came down, and here's the op. Listen close, because I don't have time to repeat myself."

Alex hated flying ballistic. No drive meant he had maneuvering thrusters at most. No active sensors was like piloting with his eyes half-closed.

The *Storm* had a tiny radar profile for such a large ship. Something about the hull materials just absorbed or bounced off at an angle almost any radar that hit it. She could also dump all her waste heat into internal heat sinks for several hours and run liquid hydrogen through capillaries in her skin, keeping the hull temperature pretty close to zero. Unless someone was really looking for her, she'd just show up as a slightly warmer spot in space with a radar profile not much bigger than a bunk bed. Alex could remember when a destroyer with similar technology had killed his old ship the *Canterbury*. How terrifying it had been when a gunship seemed to materialize out of the dark of space and started firing torpedoes. Apparently that came standard now. Still, he could relate to what their intended targets were about to experience.

"One minute," Caspar said. There was no time for sympathy.

"Copy that, one minute," Alex replied, then switched channels over to Bobbie. "Cap, we're go in sixty seconds. Your team ready?"

"Kids are belted in and ready for a roller-coaster ride," she replied.

"Copy that," Alex said, then watched the countdown timer on his screen drop toward zero. "Three . . . two . . . one . . . mark."

"Mark," Caspar said, and the *Storm* flared to life around them. The screens switched to active sensors and telescope shots of their target: a fat Transport Union freighter, escorted by two Laconian frigates. Behind the freighter lay Jupiter's vast bulk.

And that was, according to Bobbie's pre-mission brief, the reason for all the secrecy beforehand. Whether or not they could make their attack run depended on the resistance partisans on the freighter's crew getting the signal out on the ship's course and date of entry into the Sol system, all while working around a Laconian political officer who had been stashed on board. Because for the attack to work, it had to all happen while Jupiter

blocked line of sight to Earth and the *Magnetar*-class battleship parked there.

It was a lot of moving parts, any one of which could have failed out at a moment's notice, and launching the attack meant burning some spies in the union. If things hadn't panned out, the *Storm* would have just climbed back into her berth on the *Pendulum* and flown away, her crew none the wiser and the spies on the freighter undiscovered.

But the prize was worth the risk. A ship directly from Laconia with highly sensitive cargo attached to some secret Laconian project and replacement parts for the *Tempest* itself. Hopefully also some of the weird fuel pellets the Laconian ships used that couldn't be manufactured anywhere else, and which the *Storm* was getting dangerously low on. Ammunition for the *Storm*'s weapons and for the power armor suits Bobbie's team wore. Taking the freighter meant keeping the underground's best weapon armed and operational, possibly for years.

And—best of all—the political officer. Taking them alive would be a huge intelligence win.

If Alex could take care of two escort frigates and deliver Bobbie's dropship to the freighter.

"They've spotted us," Caspar said. No surprise there. With the *Storm* pinging away with active radar, she was lit up like a Christmas tree.

"Jammers on," Alex said, and the *Storm* drowned the little fleet in static, cutting them off from each other and from any outside help. The three ships didn't change course, apparently deciding the smartest move was to try to get around Jupiter. It was their best strategy. Alex would have done the same.

Which was why he'd prepared for it.

"Cap, launching you now. Make sure you come back," Alex said, and hit the button that hurled the strike team's high-speed breaching pod at the freighter. Bobbie and her boarding party throwing themselves at the enemy ship like pirates. While the pod burned hard toward the Transport Union ship, Alex fired two precisely angled shots from the rail gun past it and through the freighter's drive cone. The shots covered the thousands of

kilometers separating the ships in a handful of seconds, and the freighter's drive winked out.

"Get ready, they'll be coming for us now," Alex told Caspar, and almost as if on cue the *Storm* buzzed an angry target lock warning at them.

"PDCs hot," Caspar said. Alex was surprised at how calm his tone was. For all the sadness and fear the kid had expressed in the moments before the fight, now that the battle was on, he'd become almost machine-like. "Ready for incoming. Tubes two and four are locked."

"We should close a bit, cut off their options," Alex said. The two frigates were not a trivial threat, but the *Storm* massively outclassed them in tonnage and firepower, and he didn't worry too much about flying straight at them fangs out and trying to end the fight quickly.

"Copy that, one and three loaded and locked if we need them."

Acceleration pressed Alex back into his couch as he closed the gap. In the distance, Bobbie's pod had reached the crippled freighter and was firing grapples to lock the two ships together. The frigates couldn't talk to each other, but their crews had some emergency plans already on the books, because they split up and flew away from the freighter in opposite directions as if they'd coordinated the maneuver.

"They're trying to get on both sides of us," Alex said, but Caspar was already on it. He was tasking half their PDCs with one ship and half with the other. Didn't matter if they came from both directions at once, the *Storm*'s flak screen could handle it.

Down at the freighter, Bobbie's pod suddenly flared to life in a massive deceleration burn. Alex had crippled the freighter's drive, but the ship was still hurtling along with whatever velocity it'd had before the engine went out. Bobbie's pod was programmed to push back against that speed on a vector that would keep the freighter safely hidden behind Jupiter. Part boarding pod, part secondary, aftermarket temporary braking thruster.

"We're on board," Bobbie said, her voice phase shifted into a robotic screech as it cut through the static from their jamming.

"We have fast movers," Caspar said at the same moment the alerts showed up on Alex's threat board. The two frigates unloaded their tubes.

Alex ignored them, waiting for the missiles to get into PDC range so the *Storm* could chew them up.

“Let’s go ahead and start shooting back,” Alex said, and a moment later the *Storm* shuddered as if with pleasure as she fired four torpedoes of her own.

Before the rapidly closing missiles could even pass each other, two of the incoming torpedoes veered off in a wide turn.

“Worry about the two that are still coming at us,” Alex said to Caspar, and then stopped thinking about that. The other two Laconian torpedoes were now winging in a wide arc toward the freighter. And the two frigates had also flipped and started a hard burn back toward their former charge.

They hadn’t been able to draw the *Storm* away or shoot it down. Their plan B appeared to be scuttling the freighter. Bloodthirsty, but not unexpected. Alex threw the throttle down to catch the swiftly slowing freighter as quickly as possible, shifting from attacking their prey to protecting it. For a moment, everything was falling toward a central point in space defined by the crippled ship. The *Storm*, eight torpedoes on wide looping courses to find their targets, the two frigates burning back. On the threat board, it looked like the freighter had turned into a black hole, and its gravity was sucking everything, large and small, into its event horizon. In its way, it was beautiful.

Then everyone was shooting.

Caspar’s PDCs cut down all four of the Laconian torpedoes in an instant, even as two of the *Storm*’s impacted on the nose of one of the frigates and the plasma warheads turned the front half of the ship into glowing slag. The other frigate spun and slewed sideways and shot down the torpedoes chasing it, then continued its rotation and gave the freighter and Bobbie’s attached breaching pod a full broadside from its PDC array. The freighter was riddled with holes, and plumes of escaping atmosphere jetted out, looking a bloody pink in the reddish light coming off Jupiter. Or maybe there was some actual blood mixed in there. As many holes as the freighter had taken, it defied belief that no one on board had been hit.

“Splash that one,” Alex ordered, but Caspar was already saying, “I got that motherfucker.”

The frigate killed its rotation with a massive blast from its maneuvering thrusters, then kicked on its drive. Even though it only slowed down, it seemed to leap straight at the approaching *Storm*. The two ships passed at high speed, every PDC blazing.

The much smaller frigate was hit by half a dozen of the *Storm*’s cannons all at once, and seemed to just come apart into a cloud of chaff as it passed by. But it unleashed a barrage of its own before it died that cut along the *Storm*’s flank.

Suddenly the ship was a cacophony of alarms, sirens, and alerts from the control panel.

“Damage!” Alex yelled over the din. The noise was getting gradually quieter, which meant at least the flight deck was in the process of losing its atmosphere. He grabbed his helmet from under his couch and locked it into place. He could see Caspar doing the same.

“Damage!” he yelled again, but heard only static on his suit’s speakers. He banged his fist on the side of the helmet in frustration, then spun around. Caspar was pointing at his mouth and ears, signaling that his suit radio seemed not to be working either.

Alex flipped through the pages of damage reports popping up on his screen and found the culprit. A PDC round had cut through the computer nexus that controlled all intraship and intership communications, and for whatever reason the backup wasn’t taking over. Maybe it was fucked too. It looked like there were a lot of flashing red lights on the engineering panel.

But the *Storm* would heal the hull breaches, just like it always did. And damage control teams were already on the move to bring their other systems back online. The *Storm* would survive, Alex had no doubt.

But the freighter with Bobbie and her strike team on it was tumbling through space, out of control and empty of atmosphere, and with the radio down, there was no way for him to know if anyone on it was still alive.

Chapter Seven: Bobbie

C ap, launching you now. Make sure you come back,” Alex said. The breaching pod shook as the *Storm* cut it loose. The drive came on a moment later, slamming Bobbie back into her couch and leaving her with nothing to do while the battle raged around her.

The *Storm*’s breaching pod was a little more high-tech than the Martian version Bobbie had trained on, but there was only so much you could do with something so simple. The basic concept was a small troop carrier with an engine on one end and an airlock that could blow holes into enemy ships on the other. The interior was a close-walled metal box fitted with crash couches. The “flying coffin” joke Marines had been making for centuries would have made perfect sense even to the ancient soldiers who rolled into battle in armored personnel carriers with wheels: If you die before you get to the fight, you’re already boxed up for eternal rest.

People always claimed that waiting for the fight was the hardest part of fighting. Bobbie had said it herself, as a younger woman. When the fight is coming, when it’s inevitable, let’s just fucking get to it. Once the battle starts, things happen too fast to worry about. The fear is all instinctual, not intellectual. Somehow, that used to feel better.

Age had changed that. Bobbie had learned to see the quiet moment before the fight as a blessing. A gift. Very few people who were headed toward death even knew it was happening, much less had time to sit and reflect on their life. What they’d done that mattered. Whether it would be a good death.

Bobbie’s father had already been a legendary Marine in the MMC before she was born. When his family started to grow, he left the front lines

and became an even more legendary training sergeant. An entire generation had learned what it meant to be a Martian Marine under Sergeant Major Draper at Hecate base. A giant of a man, with a face that looked like it had been cut from flint, he had always seemed invincible. An immutable fact of nature, like the avatar of Olympus Mons, come to life and walking among the mortals.

When he'd died, he'd been a tiny shriveled husk. Lying in his bed, hooked to the tubes and monitors that only prolonged the inevitable, he'd held her hand and said, "I'm ready. I've done this a dozen times before."

She hadn't understood at the time, but now she thought he was talking about sitting right where she was now. In the transport, heading toward battle, examining his life as he rushed toward its possible end. Who am I? Did the things I accomplished matter? Will I leave the universe a better place than I found it? If I don't come back, what are my regrets? What are my victories?

It was a thing maybe only a warrior could understand. Only those who made the choice to run toward the fire, instead of away from it. That made it feel sacred to her. "This far, and no farther," she whispered. Her litany to the tyrants and bullies and despots. *This far, and no farther. If my life means anything after I'm gone, she thought, I hope it meant that.*

"What's that, boss?" Jillian asked. Her number two was strapped into the crash couch directly across the pod from her.

"Just talking to myself," Bobbie said. Then she started to sing. "Anything you can do I can do better. I can do anything better than you."

"Never heard that one," Jillian said, then sang along, trying to catch the tune. "That new? Sounds Belter."

Bobbie laughed. "No idea. My mother used to sing it. My brothers were older, and I hated losing to them at anything. I'd burst into tears when they'd win, and she'd sing that song to me. Just one of those things you pick up when you're a kid and never put back down."

"I like it," Jillian said, then closed her eyes and started mumbling to herself. It looked like she was praying. Bobbie knew she wasn't. She was running through the mission in her mind, over and over. *Two meters*

through the breached hull to the first junction. Turn left. Twelve meters to the engineering hatch. Breach and clear. Three meters to the right is the master console. The other warrior's litany.

There are people I love. There are people who have loved me. I fought for what I believed, protected those I could, and stood my ground against the encroaching darkness.

Good enough.

The pod screeched a short-lived collision alarm at them. The *Storm* had sent her pair of rail-gun shots past the hull close enough that Bobbie could have reached out and swatted them as they went by.

"Brace for impact," she said, using her sergeant voice. As forceful as it could be without quite being a shout. This was her job now. To seem an immutable fact of nature. The avatar of Olympus Mons come to life and striding through the battlefield. God of war now. Shriveled husk later. Maybe. If she wasn't lucky.

All around her, her squad of six handpicked strike team members locked and inflated their couches. All of them wore Laconian Marine power armor, though the blue color scheme had been repainted black. They were, as her father would have said, the pick of the litter. Jillian from Freehold and five of the Belters.

The Belters were old-school OPA, grizzled veterans of the endless insurgent war with the inner planets before Laconia came and made that irrelevant. Old men and women well practiced in conflict. Her total force on the *Storm* numbered forty, and included warriors from nearly every one of the old factions. But for a high-speed snatch-and-grab boarding action, you couldn't find better fighters than Belters.

"Battle mode," Bobbie said, and her armor woke up, humming with impatience for the fight. The HUD flashed an ammunition inventory at her, then minimized it into one corner of her field of view. A wireframe layout of the interior of the freighter they were about to board appeared and moved to a different corner. The list of six names and the green dot showing they were alive and undamaged scrolled down the left side of her view and

remained. Getting everyone back with a green dot instead of a black one was always a mission priority, even if it was never the top.

A flashing message appeared in the center of her field of view: FREE FIRE AUTHORIZATION.

“Free fire, alpha team, Captain Roberta Draper,” she said. Through the suit radio she heard the distant clicks as six suits of armor activated their weapons. She’d never needed to do that as a fire team sergeant back in her Martian Marine Corps days. The Corps issued weapons to people and assumed they would use them correctly and according to their training. The Laconians were much more top-down. Winston Duarte had founded Laconia by betraying Mars and looting the navy. It wasn’t a great surprise that distrust of the people in his chain of command was institutional.

The HUD flashed a new diagram at her. The relative position of the breaching pod and the freighter, along with a rapidly decreasing distance to target.

“Ready,” she growled at her team. “Go in five!”

The breaching pod shuddered as it fired grapples and grabbed the freighter. There was a quick sideways jerk, and then the two ships slammed together. The impact with the freighter was significant, but wrapped as she was in the soft gel interior of her high-tech armor and resting on the inflated padding of her crash couch, it just felt like a sudden pressure on her chest that vanished almost instantly as the pod lost its acceleration and went into free fall. That was a good sign. It meant Alex had hit his target with the rail-gun shots, and the freighter was on the drift.

“Get ready for the burn!” she said, the last word almost lost in the sudden roar of the pod firing its massive braking thrusters to keep the freighter hidden behind Jupiter. Her couch automatically unlocked and swung the other direction, putting her back to the thrust. A new pressure mounted in her chest as the g forces piled on.

When the burn started to ease up, she yelled, “Go go go,” but it wasn’t really necessary. Her fire team was up and out of their couches the second the thrust stopped. Jillian hit the wall panel next to the airlock and extended the breaching sleeve. It made an airtight seal with the freighter, the deck

vibrating with the impact. Two seconds later, shaped charges inside the sleeve cut a hole through both hulls of the Transport Union freighter, and the airlock door slid open.

Jillian was inside first, dropping through the glowing red hole into the freighter. She hit the bulkhead at the first corridor she reached and launched herself to the left, heading toward engineering. Hernandez and Orm followed her.

“We’re on board,” Bobbie said on the command channel, back to Alex on the *Storm*. Their Laconian gear was modulating the signal to match the jamming, which would hopefully let their radio cut through, but Bobbie wasn’t entirely confident in the system. It didn’t really matter yet. Alex would be busy fighting the two frigates no matter what her team was doing. Any messages back and forth before the *Storm* had secured the freighter’s flight-space were perfunctory.

She followed into the breach, the other three members of the strike team close behind her. When Bobbie hit the corridor wall, she turned right, toward the command deck. The hallway they were in was actually the central lift of the ship, and closed hatches marked each deck they passed. Most of them would lead to cargo space. A few to the crew’s living quarters. One would lead to the ops deck, and that was the only one Bobbie cared about.

Jillian and her team would take control of the drive and life support down in engineering. Bobbie would take the ops deck and cut off communication with the outside world. If the political officer wasn’t in ops when she arrived, it wouldn’t matter. They’d control the ship and search at their leisure. For values of *leisure* up to maybe five or ten whole minutes.

“Watch those hatches,” she told her team as she skimmed along the bulkhead toward ops. It felt redundant. Their suits were scanning every square centimeter around them for heat, radiation, even the unique electromagnetic signature generated by a beating human heart. It was pretty tough to get the drop on someone wearing Laconian armor. But saying something reminded the team you were there, that you were in charge, and that keeping everyone safe was on your mind.

“Copy that,” Takeshi said. “Most of these aren’t warm. Guessing the cargo is in vacuum.”

“Guy in a vac suit coming at us from behind is low probability,” she agreed, “but low ain’t zero.”

Bobbie’s HUD flashed an overlay over a door one deck ahead. “That one,” she said, and her team fanned out and took positions around it. In the microgravity of the disabled freighter, they stood on bulkheads around the hatch, weapons ready. No matter what the orientation of the ship was under thrust, for purposes of the breach the ops deck was down.

“Remember,” Bobbie said, “there are potential friendlies in there.”

As she said it, a rotating 3-D profile of two women appeared on all their HUDs.

“Protect them first, take prisoners second. Copy?”

There came a rumble of assent. Bobbie slapped the wall panel next to the hatch, and her armor ran the breaching protocol that cut through the electronic security in a fraction of a second. The hatch slid open.

After that, everyone was shooting.

It was a fact of the human brain in close quarters combat that while everything was generally happening all at once, the mind insisted on trying to stitch it into a linear narrative when remembering it later.

In the moment, Bobbie threw herself through the hatch and into the ops deck, her team at her back. Incoming bullets lit up her HUD with bright trails so she’d know the direction of fire. Some of the bullets hit her, or her team. The armor thought the odds of taking real damage were trivial, and ignored it. Seven people in the compartment, wearing light protective armor. Her suit tagged one as a friendly. One of the two resistance partisans. Five with guns shooting at her. One doing his best to hide behind a crash couch. The political officer, if she had to guess.

Her arm moved without her thinking about it, and the gun mounted at her wrist spun up briefly, cutting two of the armed crew in half. The other three were turning into red spray and body parts under the barrage of fire from her team. The whole fight couldn’t have lasted more than two seconds,

though when she remembered it later and her brain turned it into a narrative, it would seem much longer.

Less than thirty seconds after she'd opened the hatch, two of her strike team were protectively flanking the partisan, and Takeshi had the political officer shoved up against a bulkhead and was zip-tying his hands. Bobbie examined the deck. No hull breaches, her armor assured her. The Laconian antipersonnel rounds for shipboard use were pretty good tech. Lethal against lightly armored opponents, but they just fragmented into powder when they hit bulkheads.

"Ops is ours," Bobbie said.

"Engineering is ours," Jillian immediately replied. "We have one of the two spies. You got the other?"

"Copy. Our people are secure, and we have the package."

"Oh goody," Jillian said. "Can't wait to see his face when he realizes his life just went down the recycler."

"Jillian, escort the friendly up here," Bobbie said. "Let's get everyone into emergency suits and prep them for the ride over to the *Storm*. The rest of you, fan out and get an eyeball inventory. When the *Storm* arrives we're going to want to take all the best stuff with us, and we won't have much time. Get to it."

"Copy that," Jillian said.

"I think we win," Bobbie said to Takeshi. He grinned back at her.

"Easy peas—" he started to say and then blew apart.

Bobbie knew intellectually that they must have taken a raking pass from someone's PDCs. But from inside the ship it looked like the bulkheads on either side of the compartment decided to explode in several dozen places all at once. The room was full of glowing shrapnel bouncing off walls and panels, and the gray smoke of vaporized metal. Takeshi was a tangle of technology-wrapped body parts floating in a nebula of blood globes.

It didn't look like anyone else was directly hit, but before Bobbie could even start to issue an order, the air in the room was just *gone*. Too many holes on both sides. One moment they were in a pressurized cabin, the next

they were in vacuum. It happened so fast it barely ruffled the political officer's Laconian blue suit jacket.

"Get them in suits!" she yelled, but it was already too late. She was a Martian. She'd started doing vacuum drills in grade school. Fifteen seconds and you lose consciousness. Anything that you needed to do had to happen in that first fifteen seconds or it didn't happen at all. Any vacuum suit that is more than fifteen seconds away is a lifetime away.

All she could do was watch the partisan who'd helped them take the ship gasp out a cloud of mist that was her very last breath ever. The political officer, their whole reason for coming, died a moment later with a look of profound puzzlement on his face. A thousand facts and secrets that could have meant the difference between the underground thriving and all of them dying in a gulag evaporated as the man's cells gave up.

Every panel on the ops deck that still worked was flashing red. The ship was dead too.

"*Storm*, this is strike team," Bobbie said, opening the command channel. She heard only dead air and the faint hiss of background radiation. "*Storm*, come in."

Nothing.

"Shit," Jillian said. She came into the ops deck dragging their dead ally from the engineering deck with her. "Did we lose the *Storm* too?"

"Chama," Bobbie said, pointing at one of her people. "Get outside and see if you can spot the *Storm*. Maybe line-of-sight comms will work. The rest of you, mission hasn't changed. Get me that inventory. Get it ready for rapid transfer once we find the ship."

"Or," Jillian said, "get ready to fall into Jupiter and die because we're way under orbital speed now and don't have an engine."

"Or that," Bobbie agreed, surprised at how much she wanted to push across the room and punch Jillian in the face. "But until we do, we'll stay on mission. Get the fuck out of here and make yourself useful packing cargo."

On the radio, one of Jillian's squad mates said, "Lots of stuff here, boss. Ammo, fuel, it's the mother lode. Primary mission is fucked, but secondary

is a win.”

“A moral victory, I guess,” Bobbie sighed.

“You know who talks about moral victories?” Jillian asked as she floated out of the room. “The team that lost.”

Chapter Eight: Naomi

Communication was a problem.

The ring gates created interference that made trading messages across them difficult and tightbeam between systems essentially impossible. Laconia controlled the repeaters on either side of the gates, and Medina Station in the center of everything, the guard at the great crossroads of the empire. They had eyes and ears in every system and pattern-matching algorithms combing through every frequency on the spectrum. Saba had been able to carve out a few holes here and there—tightbeam antennas with outdated or compromised security code that could drop incoming records out of the logs, newsfeeds that could be altered to carry messages hidden in the flux of the image signal. The same old tricks the OPA had been using since before either she or Saba had been born, but updated for the new circumstances. The danger was twofold: first that Laconian forces would intercept and understand their messages, and second that they'd track the signal back to its origin.

The first problem wasn't trivial, but there were ways of making it difficult. Self-scrambling encryption, interference signatures, context-shifting linguistic encoding. Nothing was perfect, and even with the forensic work that Bobbie and her crew had done on the *Gathering Storm*, the full extent of Laconian military signal processing was three parts guesswork and one part hope for the underground. But Naomi was confident enough in it that she didn't lose sleep.

The second problem—not having the signal traced back—was easier because of the bottles.

Naomi had never actually seen an ocean except through a camera, but language held on to things that were long gone. Tight-beams still had “lines” even though the physical wire that *line* referred to had been light for generations. Sol was still “the sun” even though there were thirteen hundred more like it, shining down on human heads. *Message in a bottle* held a whole host of nuances and expectations for Earthers that she could only inherit thirdhand—through jokes and cartoons and entertainment feeds. The actual bottles she used were the torpedoes that she kept in her container, each of them carrying a burst transmitter and an explosive payload large enough to turn the equipment into bright dust. She’d written the code herself, and she knew it was solid.

To get information in *from* Saba and the underground, all she had to do was listen. It was all there, screaming through the void and amplified on the networks, since she knew which feeds to look at. The gossip and the newsfeeds and the empty, fluting static where the notes had been tucked in. Even Laconian propaganda. Even, sometimes, the rebroadcast messages Duarte made Jim send out to her.

No matter what ship she was on, the information came in, passive and untraceable. She fed it into the local system in her couch and her hand terminal—more raw information than she could have read in a lifetime, and updating constantly. And the system filtered out the reports and information for her to work from.

She made her analysis, her recommendations, her arguments for what the forces opposing these new inners should do and how. And when she was ready—when time was short or she felt like she’d come to a natural break point—she would transfer the information into one of the missiles and signal her shipboard contact. Once the missile was dropped out an airlock, her code would kick in.

A randomized direction, a randomized number of turn-and-burns, a randomized length and power of thrust, and a randomized time before delivery. Sometimes she’d drop it off a day or two before she left the system, or after the shell-ship she’d come in on had moved on. Sometimes

she wouldn't. Patterns were the enemy, even patterns that were meant to cover her tracks.

When the time came, the bottle screamed out everything she'd told it in a single burst. Somewhere in the system, Saba would have an antenna listening just the way she did. Quietly, passively, undetectably. It was an act of cosmic ventriloquism, and it was how the underground passed information back and forth—slowly and imperfectly—while the enemy could send its own messages anywhere it chose to at the speed of light.

That was what being the underdog meant.

The hardest part was the time between sending the bottle out and when it detonated. Hours or days or, rarely, weeks of second-guessing herself. Poring over her own plans and suggestions, certain that she'd made a mistake she couldn't stop before it rippled out through the systems. Listening to all the new information coming in that would have changed one aspect or another of what she'd already said and couldn't take back.

It was what she was doing now.

Her box had left the *Mosley* for another ship, almost its twin, called the *Bhikaji Cama*. They were on a quarter-g burn for Auberon with mining equipment salvaged on the cheap from Mars. The hum of the drives was familiar enough by now that she didn't hear it unless they were making some adjustment to speed or trajectory, and then it was only when the vibrations hit a harmonic and made something ring. The rations she'd gotten as a farewell gift from the *Mosley* were Earth-made. Rice and vegetable protein and curry sauce that might almost have been Belter food, except for the added raisins. She set her system to local, not tying into the *Cama's* computers at all unless there was something she could only get there. She had music—soft mambo cereseano like she'd danced to when she was a girl—and as many newsfeeds as she could stand. She'd arranged her space so that there was room to stretch and exercise, and she made herself keep to a schedule religiously, pushing herself to a sweat twice a day. She slept to schedule too, dimming the lights for eight hours, no more and no less, never sleeping in. Never taking naps. Routine was what kept the darkness at bay, when anything did.

And in between, she studied her data again and waited for her most recent bottle to break.

The monitor showed a schematic of Bara Gaon Complex with both the existing settlement and the newly proposed expansion. Bara Gaon was one of the most successful of the new human systems, with three planets already boasting self-sustaining cities, an independent mining cooperative surveying a particularly rich asteroid belt, and bases on two moons of the system's only gas giant. The map of humanity's presence in the system looked like the first growth of a leaf: pale, elegant, thin, and promising a greater strength still to come. The initial waves had been led by an agricultural corporation based on Ganymede and a progressive Muslim community out of the Greater Terai Shared Interest Zone. The two had managed a functional partnership that drew five more waves of settlement in under two decades.

It was a fraction of Sol system, but it wouldn't be for long. The expansion plan had been trapped in negotiations for years before Laconia had rolled through, and now Duarte's will was kicking it forward.

Five new cities had been proposed, two each on the planets nearer to their sun, one on the cooler outlier. A high-end sensor network that would be able to map the system over the course of the next six years. Eighteen new exploratory missions. An increased civil infrastructure rolled out in two-year increments, with an emphasis on scientific and cultural support. If it worked, Bara Gaon would eclipse Sol system in under a century. It was as ambitious as any plan Naomi had ever seen, and it might even be possible.

That ambition was also the underground's best hope. *Her* best hope.

She flicked through the lists of project proposals. She'd been over all of them a hundred times. Every phase had its own requirements. The sensor network alone was slated to hire a hundred and thirty engineers and subject specialists. And while the network's primary function was mapping, it didn't take a genius to see its potential as system surveillance. It would make the underground's covert operations in Bara Gaon Complex easier if between 10 and 20 percent of those engineers and specialists also answered to Saba.

She'd put together her own map of the project. Not impeding the expansion, but taking control of it from within. The Personnel Directorate of Bara Gaon was her first target. They were already putting out requests for applications, beefing up the bureaucracy that would be evaluating new hires. Naomi had identified seven critical positions and built candidate profiles that Saba could use to flood the job openings with his allies. It was important that the people not be false identities, but actual people with real histories and qualifications. If they managed to get two of the seven positions now, it would be enough to give them an edge on later ones. Three, and they'd be able to cover their own tracks well enough that prying them out would be difficult even if Laconia became suspicious. Five, and Saba would effectively control the Bara Gaon Complex expansion.

She'd also identified problem issues. The chief administrator of Zehanat province on Bara Gaon-6—the planet they called Al-Halub—was a close friend of Carrie Fisk and openly supportive of Laconian rule. It was important that the projects based there be deprioritized and his personal influence undermined. Labor unions on the gas giant's moons had ties to an old inner planets hate group and still fought against everything the Transport Union did with the zeal of the self-proclaimed oppressed. Saba would need to create other allies there. The local government had a communitarian faction that was growing more vocal about armed resistance against Laconia that would bring more scrutiny without gaining any useful ground if it wasn't reined in.

You can't fight a shooting war armed with paper clips, Bobbie said in Naomi's imagination.

"Watch me," Naomi answered. Her voice echoed with the music in the container. A pinch of annoyance bothered her. She closed down her files and pushed the monitor aside. In the time since she'd left Sol system, she'd hoped that their last conversation would have lost some of its power, but like a splinter under her skin, it bit a little every time she touched it.

When two people get in a fight, and only one has a gun and the will to use it? That's a short damned fight.

Only it wasn't Bobbie's voice that said it this time. It was Amos'. A few decades flying the same ship together had built little versions of her family in her head. Made some part of them a part of her, even when she didn't particularly want them to be. Even when the little mirrors of them only told her that their conversation wasn't finished.

She hauled herself up out of the couch, the gimbals hissing as she shifted. She turned the music to a brighter selection with a clearer, faster beat. Something to push her. It was early in her day for a workout, but she needed to move. As if working the long muscles of her arms and legs and back could relieve a tension between her and people not present.

"It's never a short fight," she said as she hooked resistance bands to the top of her container. The fasteners had been painted gray when she'd first stepped into her little box. They were bright raw steel now. "Last time I fought it, it was generations old before I even stepped in the ring. We can't shoot our way to peace."

Peace isn't the only good victory condition. How about just shooting our way to freedom or justice?

Naomi sank her feet into the floor loops, braced herself, locked the bands in place, and pulled. It was hard work. It hurt a little, but hurting a little was the point. The voice in her imagination wasn't Amos' now, but Jim's.

That's the thing about autocracy. It looks pretty decent while it still looks pretty decent. Survivable, anyway. And it keeps looking like that right up until it doesn't. That's how you find out it's too late.

"I am fighting," she said, then grunted and pulled down hard again. "The quiet work's still a fight. It's a better one. It's one we can win."

Not in our lifetimes, Bobbie said. And that was the point, really. That was the deep, true thought that Naomi was working her own way through with all the beloved voices in her head.

Sweat was pooling at her hairline, the quarter g not quite enough to pull it down her face. Her arms were trembling with every pull. She made herself go slowly, watching her form. It made the work harder, which she

liked. And it made her less likely to injure herself, which was critical. Slow, careful, focused. Avoiding damage.

Feels like it ought to be a metaphor for something, Jim's voice said, and she laughed at his joke.

Growing older was a falling away of everything that didn't matter. And a deepening appreciation of all the parts that were important enough to stay.

She had unhooked the bands and started repositioning them to work her back when the alert came, chirping on her couch monitor and her hand terminal at the same moment. She wound the bands up and put them away. She'd finish later. The monitor had a single notification up. The *Cama* had picked up an encrypted message that matched her confirmation signature. Out in the depths below Auberón's ecliptic, the bottle had broken and its data had all spilled out. She grabbed a copy out of the ship buffer and had her system run a comparison. There would be some degradation. There always was. But there was also repetition in the signal and checksums along the way. It would take terrible luck or a very high-radiation event to swamp her work past the point of recovery. She only made sure because it was the right thing.

All the files and reports opened from the copy as they had from the original files. The system's final verdict popped up with a click like someone snapping their fingers. NO UNRECOVERABLE LOSS.

So that was done. Another round of analysis, a new set of orders and recommendations released to the wild. She had, of course, already started on the next one. She enjoyed the sense of accomplishment all the same.

She shifted to the newsfeeds, purging the unflagged copies local to her couch and replacing them again like dipping a cup into a fountain that never ran dry. Tapping her finger against the screen, she paged through the items the system thought most likely to pertain to her. A minor election on Sanaang had gone unexpectedly to the second-ranked candidate, a move she had recommended in her bottle before last. A code farm on Mars had partnered with Medina Station to build a new security infrastructure, which wasn't what she'd wanted, but had been on her list of acceptable fallbacks.

A security alert had gone out in Sol system. A red flag, but without the details to say what it was.

Except that whatever it turned out to be, she knew what it was. Bobbie's war. The one with guns.

Somewhere out there, far enough away that even lightspeed meant hours, Bobbie and Alex were risking their lives. Maybe losing them. There was nothing she could do. Frustration washed over her. Or maybe she just became aware of what was always there.

She'd chosen her role. She'd picked her place, helped with designing the little dried shell-game pea that she lived in. There had been a dozen other ways she could have worked with the underground. Thousands of ways she could have made a new life without them. She was here because she had chosen to be here. The container had felt like solitude, not isolation. A refuge where she could wait for the mud in her heart to settle and her mind to become clear.

It had seemed like a good plan at the time. It had seemed to work. Now, her fingertips hovering over the security alert, she wasn't sure it did anymore.

With a tap like she was killing an insect, she shut the newsfeeds. Her data analysis was still up behind it, cheerfully reporting NO UNRECOVERABLE LOSS.

"Seems like that should be a metaphor for something," she said, and imagined Jim's laughter beside her. Trading the same joke back and forth between them like they had in better days.

Then, a moment later, "God damn, but I have to get out of this fucking box."

Chapter Nine: Teresa

Carrie Fisk was the president of the Association of Worlds. It was, Teresa knew, a measure of how important she was that President Fisk was allowed to meet with her father over breakfast. Teresa sat at her father's right at the little table, and Fisk sat opposite him, so Teresa felt a little like she was watching table tennis listening to them talk.

"A trade compact between Auberon and the five-world group does have some real advantages," Fisk said. "By picking a handful of systems to really focus on, we can make progress quickly. Auberon or Bara Gaon can bring another three to five systems up to self-sufficiency in seven to ten years, then each of those systems can take on clients. The geometric growth model brings all the systems up much faster than having every individual colony be an equal priority."

Her father nodded slowly. It was a gesture she recognized. He glanced over to her and raised an eyebrow. A little gesture of complicity. Teresa could feel Fisk squirming a little. The woman was so anxious for her father's approval it was a little embarrassing. Teresa shrugged. Just a few millimeters of movement that meant *Do you want me to ask?* Her father nodded.

"What about corruption?" Teresa said.

Fisk laughed. "Auberon's reputation precedes it. Governor Rittenaur assures me that it's under control. There were a few bad apples, but that's to be expected in an unregulated colony. Now that it's under Laconian supervision, the problem is being addressed."

Teresa nodded, then leaned back to see how her father responded. He was slower. Teresa took another bite of her eggs. The yolk was runny, the

way she liked, and she sopped it up with a bit of toast. Kelly—her father’s personal valet—brought Fisk another coffee. When her father sighed, the defeat was clear in Fisk’s eyes. Just for a moment, and then covered over, but Teresa had seen it.

“The architecture is good,” he said. “I’m not certain these five are the right worlds to lead with. Let me review this and get back to you next week.”

“Yes, sir,” Fisk said. “Of course.”

After the breakfast meeting was done, Fisk left and Teresa stayed. As Kelly cleared away the dishes, her father stood, stretched, and turned to her.

“What did you notice?” he asked.

“She was nervous,” Teresa said.

“She always is,” her father said. “That’s part of why I chose her. When people get too comfortable, they get loose. Sloppy. What else?”

“She knew that the corruption question was coming. And she focused it on Auberon instead of how the five worlds were selected.”

“Was she trying to cover something up?”

“I don’t think so,” Teresa said. “It looked to me more like she knew Auberon had a bad reputation, and she was just reaching for the obvious thing. When you focused on the world selection she seemed . . . relieved?”

“I agree. All right. That was interesting. I have a military briefing from Trejo in Sol system. Any interest in reviewing it?”

The answer was no. It was peer class day, which meant seeing Connor. More than sneaking out to see Timothy, more than playing with Muskrat, more even than being with her father, she wanted to go to class. But she also felt guilty about her desires. She didn’t want to make her father feel like he wasn’t important to her, especially when it was a little bit true . . .

“If you want,” she said, making her voice bright and carefree.

He chuckled and tousled her hair. “I don’t need it. You can go work with Colonel Ilich. If Trejo has something critical, I’ll let you know.”

“All right,” she said. And then, because she could tell he knew what she’d been thinking, “Thank you.”

“Always,” he said, and waved her on.

She knew as soon as she stepped into the classroom that something was wrong. Usually the others were spread in clumps, lounging on the sofas and chairs of the common area, with half a dozen conversations going on among them. They would notice when she walked into the room, but they didn't make an effort not to stare at her. Today, they had scattered to the edges of the room, leaning against walls or against the pillars like little prey animals that knew a predator was close. Connor was by himself, frowning at a handheld like it had insulted him and he was trying to keep his temper. The others all glanced at her and then away again, but Connor didn't see her with an energy and focus that felt deliberate.

"I'll be right back," Colonel Ilich said, touching her on the shoulder. "I just need to get one thing before we start."

She nodded, dismissing him. Her attention was on Muriel Cowper. She was a year older than Teresa, with dusty brown hair, a chipped front tooth, and a talent for drawing that meant she did all the face painting at the large-group events. She approached Teresa now, and it looked like she was trembling. It reminded Teresa of Carrie Fisk.

"Teresa," the other girl said. "Can I . . . could we talk for a minute?"

Teresa felt a little prick of dread, but she nodded. Muriel took a couple steps toward the door to the courtyard, then stopped and looked back the way Muskrat did sometimes, to be sure Teresa was following. In the courtyard, Muriel held her hands in front of her belly like a child being disciplined. Teresa wanted to take them, push them back down to her sides, make her act normal. Muriel's anxiety was like heat from a fire, and it made Teresa feel anxious too.

"What's going on?" Teresa asked.

Muriel licked her lips, took a deep breath, and looked up, her eyes locked on Teresa's. "There was a camping trip with the school last week, and all of us went, and it was overnight so a bunch of us snuck out to the water when we were supposed to be asleep and Connor kissed me."

Teresa felt something. She didn't know what it was, but it lived in her abdomen, just below her navel, and in deep enough that she knew it couldn't be muscular. The implications clicked over in her mind like dominoes. Connor had kissed Muriel. Not just that, but Connor had *wanted* to kiss Muriel. Not just that, but Muriel had known that Teresa would care. And so had everyone else.

Oh God, and so had Connor.

"I can break up with him," Muriel said softly. "If you want me to."

"I don't care what either of you do," Teresa said. "If you and Connor want to go into the woods and kiss, it doesn't mean anything to me."

"Thank you," Muriel said, and went back into the common room, almost skipping. Teresa followed her, trying not to let anything that was happening in her body show on her face. Colonel Ilich arrived as she did, smiling warmly. He had a round black-and-white ball the size of a decapitated head under his arm.

"Today," he said to all of them, "we're going to be learning some new football drills. The rain's made the east lawn a little damp for the process, so if you fine ladies and gentlemen will please follow me to the gymnasium, you can change into more appropriate clothes . . ."

The middle of the day was filled with echoing shouts and the burn of her legs and back. She kicked too hard and missed more of the shots than she made, and through all of it, she felt the attention of the class on her. Of Muriel. Of Connor. Even Colonel Ilich noticed that she was off her game, but apart from a gentle question about how she was feeling, he didn't follow up on it. When the time came to shower and change back into her regular clothes, she didn't go to the locker rooms with the others. She had her own apartments. She didn't need to be with them anymore. Not any of them.

As she left, she looked to see if Connor was with Muriel. If they were holding hands. If they were kissing. As it happened, they weren't—Connor was at a brushed steel drinking fountain with Khalid Marks and Muriel was pretending that she'd died and had to be carried off the floor by Anneke Douby and Michael Li. Teresa thought it should make her feel better, but it didn't.

In the privacy of her rooms, she let herself cry. She felt stupid for having to. Connor wasn't anything to her but the boy she'd thought about more than other boys. She'd never kissed him or tried to hold his hand. Until today, she'd have said that he didn't even know that she felt different about him. That no one knew. Except now he was sneaking out of his tent with Muriel fucking Cowper in the middle of the night. Who was even in charge of the camping trips that they let things like that happen? Someone could have been drowned or mistaken for prey by a local animal. They were incompetent. That was the problem. That—improbable as it was—was why she was sobbing.

Muskrat forced a thick, prickly nose under her arm, pushing up. The concern in the old dog's eyes was unmistakable. Her thick tail wagged uncertainly.

"I'm stupid," Teresa said, and her voice sounded exhausted even to her. "I'm just really stupid."

Muskrat coughed out something less than a bark and hopped on her front legs. An unambiguous invitation. *Let's forget this and go play.* Teresa threw herself down on her bed, hoping that sleep would come or that the bed would open up like in the movies and let her escape to a different dimension where no one had ever heard of her. Muskrat huffed again. Then barked.

"Fine," Teresa said. "Just let me put some clothes on that don't stink like sweat. Idiotic dog."

Muskrat wagged harder. More sincerely.

The morning clouds had gone, but the landscape was still soaking from the rain. The water cycle was something that all the worlds in the empire shared. Any world with life had rainstorms and mud puddles. She walked down the colonnaded paths, tending away from the more inhabited parts of the State Building. She didn't want to have any company but her dog and her self-pity.

She wondered what she could have done differently. If she'd told Muriel no, that she had to break things off with Connor. She could have done that. She still could, a little. If she went to Colonel Ilich and said she didn't feel

comfortable with Muriel anymore, she could have the girl kicked out of the peer interaction activities. Even request that Connor spend more time at the State Building if she wanted to, and it would just happen.

But everyone would know why she was doing it, and so she couldn't. Instead, she walked across the gray-green of the back gardens, looked out at the low, green rise of the mountain beyond the State Building's grounds, and wished she could leave or die or turn time backward.

Muskrat alerted, dark, floppy ears pointing forward with excitement. The dog barked once in what sounded like excitement and then bounded away faster than an animal on old worn-out hips should have been able to. Despite herself, Teresa laughed.

"Muskrat!" she shouted, but the dog was onto something and wouldn't be turned away. The thick, wagging tail disappeared behind a hedge of lilacs imported from Earth, and Teresa trotted after.

She half expected to find Muskrat worrying a skitter or ash-cat or other local animal that had wandered onto the grounds. The dog did that sometimes, even though the local animals made her sick when she ate them. Teresa always worried that one of the larger native predators would sneak in someday. But when she made her way around the hedge, the only thing besides Muskrat was a human figure, sitting on the grass and looking out toward the horizon. Graying, close-cropped hair. Laconian uniform without an insignia of rank. An amiable, empty smile.

James Holden, and Muskrat sprawling on the grass beside him, wriggling to scratch her back. Teresa stopped short. Holden reached out idly and rubbed her dog's belly. Muskrat hopped to her feet and barked to Teresa. *Come on!* Almost against her will, Teresa found herself walking toward the most famous prisoner in the empire.

She didn't like Holden. Didn't trust him. But whenever they spoke, he was polite and unthreatening. Even a little amused by everything in a vague, philosophical kind of way that made it easy to be polite back.

"Hey," he said, not looking up at her.

"Hello."

“You know what’s weird?” he said. “The rain smells the same, but the wet ground doesn’t.”

Teresa didn’t say anything. Muskrat looked from the prisoner to her and back again, as if she expected something she was looking forward to. After a moment, Holden went on.

“I grew up on Earth. When I was your age—you’re fourteen, right? When I was your age, I was living on a ranch in Montana with eight parents and a lot of animals. Rain smelled like this. I think it’s the ozone. You know, from the electrical charges? But the ground after a storm had this deep smell. It was like . . . I don’t know. It smelled good. Here, it smells minty. It’s weird.”

“I’ve been around wet soil before,” she said, almost defensive. “That smell’s called petrichor. It’s actinomycete spores.”

“I didn’t know that,” Holden said. “It’s a good smell. I miss it.”

“That’s my dog.” The implied *so get away from her* was lost on him.

“Muskrat,” Holden said, and Muskrat thumped her tail, pleased to be included in the conversation. “That’s an interesting name. Did you pick it?”

“Yes,” Teresa said.

“Ever seen a real muskrat?”

“Of course not.”

“So why the name?” The way he asked seemed weirdly open. Almost innocent. Like she was the grown-up and he was the kid.

“There was a character named that in a picture book my father used to read to me.”

“And was the character a muskrat?”

“I guess so,” Teresa said.

“Well, there you have it,” Holden said. “Mystery solved. You don’t have to be afraid of me, you know. She’s not.”

Teresa shifted her weight. The ground under her was still soft from the rain, and he was right. It smelled like mint. A half dozen possible responses came to mind, from turning and walking away to telling him that she wasn’t scared of him and he was stupid to think she was. If she hadn’t already been feeling humiliated and angry, she probably would have laughed it off. But it

turned out she was spoiling for a fight, and he'd handed her one. He was one of the few people it was perfectly safe to bite at.

"You're a terrorist," she said. "You killed people."

An expression crossed his face almost too quickly to see, then he smiled again. "I guess I was. But I'm not anymore."

"I don't know why my father doesn't keep you in prison," she said.

"Oh, I know the answer to that one. I'm his dancing bear," Holden said, and lay back on the grass and looked up at the sky. High white clouds against the blue, and the glittering lights of the construction platforms beyond them. Teresa understood the game. He was pulling her into conversation. The thing about the rain and the soil. How Muskrat got her name. Now this mysterious dancing bear comment. All of them were invitations, but it was up to her whether to play along.

"Dancing bear?" she said.

"Old kings used to have dangerous animals in their courts. Lions. Panthers. Bears. They'd teach them to do tricks or at least not to eat too many of the guests. It's a way to show power. Everyone knows a bear is a killer, but the king is so powerful that a bear's just a plaything for him. If Duarte kept me in a cell, people might think he was afraid of me. Or that I might be a threat if I got out. If he lets me out, lets me roam around with what sort of looks like freedom, it tells everyone that comes to the palace that he's cut my nuts off." He didn't sound angry at all. Or resigned. If anything, he was almost amused by it.

"You're getting your back wet, lying down like that."

"I know."

The moment stretched, and she felt the silence pushing at her. "How many people did you kill?"

"Depends on how you count it. I tried not to get anyone killed when I could help it. The thing is? I *am* in prison. Right now, I'm pretty sure there are at least two very well-trained snipers ready to open up my brainpan if I try to hurt you. So not only am I not inclined to hurt you, I literally couldn't, even if I thought it was a good idea. That's the point of a dancing bear. It's the least dangerous thing at the court, because everyone's aware of

it. The ones you trust are always the most dangerous. A lot more kings and princesses got poisoned by their friends than eaten by bears.”

Her handheld chimed. Colonel Ilich asking to speak with her. She sent an acknowledgment, but didn’t open a connection. Holden grinned up at her.

“Duty calls?” he asked.

Teresa didn’t answer him except to tap her leg. Muskrat hauled herself up to her feet and trundled over, as pleased to leave as to stay. Teresa turned back toward the State Building. When Holden called back after her, there was a buzz in his voice. Like he was trying to fit more meaning into the words than the syllables could hold.

“If you’re worried, you should keep an eye on me.”

She looked back. He was sitting up. As she’d warned, his back was dark with wet, but he didn’t seem to care.

“They’re watching me all the time,” he said. “Even when it seems like they aren’t. *You should keep an eye on me.*”

She frowned. “All right,” she said, then walked away.

As she headed back toward her rooms and the colonel, Muskrat huffing contentedly at her side, Teresa tried to decide what she was feeling. The sting of Connor and Muriel was still there, and the shame at feeling stung. But they weren’t as immediate as they had been. And along with them was an uneasiness she couldn’t quite fit her mind around, only that it had to do with the fact that Muskrat liked stumbling across James Holden and she didn’t.

She found Colonel Ilich in the common area. The couches and sofas felt very different with all the other students gone. The walls themselves felt like they’d taken a step back and left a fraction more room for the emptiness. Her footsteps echoed, and so did Muskrat’s claws tapping against the tile. Ilich was going through something on his handheld, but he stood up as soon as she came near.

“Thank you,” he said. “I hope I wasn’t interrupting anything?”

“Nothing important,” she said. “I was just walking.”

“That’s excellent. Your father asked me to see whether you were available.”

“An incident?”

“Piracy in Sol system,” Ilich said. Then, a moment later, “Piracy with some unfortunate security implications. There may need to be an escalated response.”

“Did something important go missing?”

“Yes. But before we go to your father?” Ilich’s expression softened. For a moment, he had the same expression she’d just seen on James Holden. It was eerie. “I don’t want to intrude, but I had the feeling that there was something bothering you at the peer seminar today.”

This was her moment. All she had to say was that she didn’t feel comfortable with Muriel anymore, and the girl would never be welcome at the State Building again. Or that she wanted to go on the next camping overnight that the school took. Then she could sneak out at night and kiss a boy down by the water. She could feel the words in her mouth, solid and hard as candy. But then Ilich would know. He knew already.

The ones you trust are always the most dangerous.

“Teresa?” Ilich said. “Is something wrong?”

“No,” she said. “Everything’s fine.”

Chapter Ten: Elvi

Something was wrong. She didn't know what it was, only that she had an overwhelming sense of threat and dislocation. She was coughing and vomiting breathable liquid, and Fayez was already gone. His couch looked empty and dry. He'd been out of it awhile. Her mind slowly came back. She was on the *Falcon*. They'd been burning hard to the Tecoma system. She'd been in a high-g crash couch. And something had gone wrong.

She tried to say *What happened?*, but all that came out was, "Wa appa."

"Don't try to speak yet," her med tech said. A likable young ensign named Calvin with dark skin and features that made Elvi think his ancestors might have come from the same region of West Africa as her own. She'd never asked, because he almost certainly wouldn't know. Laconians did not share the Earther interest in ethnic origins. His face seemed to swim in and out of focus, and her mind felt weirdly disconnected from her body.

"Wa—" she said, ignoring his advice, and then she vomited again.

"Stop it," Calvin said more forcefully. "You had a reaction to the sedative mix while you were under. We had to run some tests and a procedure before we revived you to make sure we didn't do any damage."

Calvin pulled a medical cuff off her arm that she hadn't even noticed was there. The needles stung as they retracted. Several tubes ran from the cuff to a drug-dispensing monitor nearby. Elvi tried to read the screen to see what they'd been pumping into her, but her eyes couldn't focus. The words remained a mysterious blur.

"What—" she managed to get out without vomiting, but before she could finish, Fayez burst into the room.

“You woke her? Why didn’t anyone call me!” he yelled at Calvin. “Let me see her chart!”

Fayez grabbed her hand and squeezed a little too hard. Up close, she could see that his eyes were a little red and puffy. Had he been crying?

“Sir,” Calvin said. “She woke because the procedure had finished. All her scans are clean. No brain damage. There should be no loss of function.”

“Brain damage?” Elvi croaked out. “Were we thinking brain damage?”

Her throat felt raw. Fayez grabbed a plastic bottle of water with a straw and held it up to her lips. She drank greedily. Apparently she was thirsty. Good to know.

“There was some concern that your breathing had been depressed,” Fayez said as she gulped down the water. “We just wanted to be sure.”

“It was unlikely,” Calvin added. “But we wanted to take every precaution.”

“What happened?” Elvi finally managed to say once her thirst was quenched.

“You didn’t tell her?” Fayez shot at Calvin. “Els, honey, you had a reaction to—”

“No,” she cut him off. “I know that. Where are we? I feel gravity. Are we through the transit?”

As she spoke, Calvin began putting his instruments away. It looked like whatever had happened to her, the treatment for it was over.

“Yes,” Fayez said. “We’re in Tecoma right now. We’re finishing our deceleration burn.”

“I’ve been out that long?”

“I was scared to death, Els. I’m getting a full battery of tests run to make sure this doesn’t happen again.”

“Sagale’s schedule won’t—”

“Sagale agreed with me. I was surprised too. I think the prospect of losing Duarte’s pet biologist had him pissing his uniform.”

Calvin snorted at that. “I’m done here. Do you need anything else?”

“No,” Elvi said. “Yes. When can I go back to work?”

“Now, if you feel up to it.”

“Thank you, Calvin,” Elvi said.

Calvin gave her a salute and a smile. “My pleasure, Major,” he said, then left the compartment.

“Maybe you should rest,” Fayez said. He was frowning at her. Elvi laughed. He almost never frowned, and with his baby face it made him look like a petulant child.

“I’m fine,” she said. And then, “Okay, I’m not fine. I’ll be fine. It’s just travel.”

“I don’t like it,” Fayez said. She took his hand. Her skin felt sticky. She was going to need a real shower.

“So, Tecoma system,” she said. “The probes said it was a neutron star?” She tried sitting up. Her head swam a little, so she stopped there.

“It is,” Fayez agreed, putting a hand on her back to help steady her. “But, you know, weirder.”

The dizziness passed, and her eyes were focusing better as well. The text on the screens around her became actual letters and numbers.

“Help me up,” she said, then dropped her feet to the floor. Fayez put an arm around her waist as she tried standing. Her legs were a little weak, but the gravity felt like they were only burning at a quarter g or so, so it was easy to stay upright. Fayez gave her a look, then took his arm away, waiting close by to grab her if she fell. She didn’t.

“I’ll need some clothes,” she said. Fayez nodded and opened a nearby storage locker. “Weirder how?”

“Emptied,” Fayez said, then tossed her uniform and some clean underclothes on the couch. “Massive rapidly spinning neutron star, no planets, planetoids, asteroids, nothing.”

Elvi pulled off the thin smock she wore in the submersion couch and headed to the shower. Fayez followed her in, carrying a towel. The blast of hot water made her dizzy again, but one hand on the wall and some deep-breathing exercises cleared it up in a few seconds. Fayez watched closely, but once he was sure she was all right, he relaxed. As she washed the last of the goop off her body, Elvi said, “They cleared everything out to make a diamond backup drive too.”

“This is more than that. I don’t mean no planetary bodies. I mean no nothing. No micrometeors. No dust. No spare protons floating around. The vacuum here is as hard as it can get.”

“That’s . . . Okay. Weirder.” Elvi turned the water off, and Fayez tossed her the towel. “I mean, is that even possible?”

“No. Not unless there’s something keeping it clean. We’re still in the Milky Way. There should be some spare crap floating through now and then. So not only is the system cleaned out, something’s actively keeping it cleaned out. And—get this—the gate is five times farther out from the star than any of the other gates. And it’s above the plane of the ecliptic. Ninety degrees. Don’t even get me started on the star.”

“What’s going on with the star?”

“It’s massive. I mean, like, spit-on-it-and-it’ll-start-to-collapse-into-a-black-hole-level massive.”

“Good that there’s no spit around, then.”

“Right? It turns out neutron stars aren’t much to look at. Unless you can see magnetic fields, they’re just . . . underwhelming. I mean the densest matter possible, forces so powerful as to break space-time? Sure. Bright as hell, you bet. But I was expecting a light show or something. It just looks like another sun, but smaller and kind of angry about it. This one is spinning fast enough to land in the pulsar range. We’re far enough away to avoid the worst of the magnetic disturbance.”

She took a deep breath. She could hear the anxiety in his words. She knew what they meant.

“I’m *fine*,” she said.

“You aren’t. You could have died.”

“I didn’t, though. And now, I’ll be fine.”

“Okay.”

Elvi finished drying off and stuffed the towel into the recycler. Fayez pulled a jar of scalp cream out of a cabinet and began rubbing it into her short, tight curls with his fingertips. It felt wonderful to have him massaging her head. When you find a man who takes pleasure in helping you avoid dry scalp, Elvi thought, you keep him.

“You can do that all day if you want,” she said.

“If we had all day, my attentions would begin moving south,” he replied with a grin. “But we’re killing our burn in about two hours, and I don’t believe that you’re going to wait one more second to start working.”

He closed up the cream jar and put it away while she started pulling on her clothes.

“So what were they thinking?” Elvi said.

“Hmm?”

“Making a neutron star so big it’s hovering on the edge of collapse, and then clearing everything out of the system so that it doesn’t. Moving the ring out of the ecliptic.”

“You think they made a neutron star? Seems more likely they just built a gate to a dud system.”

“How? There had to be life here for them to hijack, or the gate wouldn’t have been built. This was a living system like Sol that got turned into . . .” She waved her hand.

“Yeah,” Fayez agreed. “I don’t know. Honestly, this miracles-and-wonders thing feels like drinking from a fire hose sometimes.”

Elvi finished with her uniform, then brushed her teeth as Fayez waited and watched her. She gave herself one last critical look in the mirror, then said, “Let’s go see the boss.”

Fayez grabbed her and undid her careful uniform straightening with a hug. “Thanks for not dying, Els.”

Forty-eight hours later, they’d gone through the drill. The ship’s system had analyzed the telescopic data. Elvi had gone to pay her respects to the catalyst the way she always did, and then performed the experiment. The protomolecule reached out, and the data streamed in. The *Falcon* searching for any change, any effect. This time, Elvi actually let herself sleep in between. Near-death experiences wore her out, apparently, even if she

hadn't been aware of them at the time. In addition to which, this time, there wasn't much to see.

When they'd finished their analysis, Sagale came to the bridge and braced himself on one hand-hold and one foot-hold. His eyes shifted from one screen to the next, taking in the data streams with an air of pleasure.

"Mehmet," Elvi said.

"Major Okoye," Sagale said, and nodded toward the main monitor. Magnified so that it filled the screen, the tiny but massive star was the only object within nearly two light-years of the Tecoma gate. "Tell me that *this* system is the most important scientific discovery of all time."

"No," Elvi replied. "Pretty sure the big green diamond still wins that prize. But it is amazing."

The neutron star on the screen was too hot to radiate much energy as visible light, but the screen still had to dim it down to keep it from blinding everyone in the room.

"More than three stellar masses stuffed into a ball half the size of Rhode Island," Jen said.

"What's a road island?" Travon asked. He'd been a Martian, back before they were all Laconians.

"Major Okoye," Sagale said, ignoring the banter. "Am I correct that this is exactly what it looks like? A single unusable star in a system devoid of other artifacts or exploitable planets?"

Something in his tone caught Elvi's attention. It had a stiff formality to it. As though he were asking her questions under oath. She felt like they were engaging in some sort of ritual that he understood and she didn't.

"That's what it looks like," she said carefully. "Yes."

Sagale nodded his massive head at her. The pleasure seemed to radiate from him. "Come to my office in five minutes."

He pulled himself away, disappearing down the corridor. Faye met her gaze and lifted an eyebrow.

"Makes me nervous too," she said.

She checked the data one last time like she was going over her class notes before a test. She had a sense that there was something in it she'd

overlooked. It wasn't a feeling she liked.

"Coffee?" Sagale asked when she arrived. He was floating next to the beverage machine inset in one of the bulkheads of his office. Two drinking bulbs drifted next to him. It was the first time he'd ever offered her anything in hospitality. It made her nervous.

"Sure," she said so that he wouldn't notice.

The machine hissed as it injected cups of coffee into the bulbs, one at a time. "Sweetener? Whitener?" Sagale asked, still fussing with the machine.

"No."

Sagale turned to her and gently pushed one of the bulbs in her direction. She caught it and depressed the bubble on the lid that opened the flow to the drinking tube, then took a sip. The coffee was just right, hot but not scalding, bitter and strong and vaguely nutty.

"Thank you," she said, waiting for the other shoe to drop.

"I want to extend the thanks of the Laconian Empire for your work on this project. Now that we have identified a system of no utility, we are moving to the military phase of the operation," Sagale said after a short pause while he sipped at his coffee.

"The what?"

"Two ships are entering this system as we speak," he said. "They are both uncrewed, and controlled remotely from this vessel. Both are large freighters. One is empty. The other has a payload."

"A payload?"

"The high consul has been able to use the construction platforms over Laconia to isolate and contain antimatter. The second ship is carrying slightly over twenty kilograms in a magnetic containment device."

Elvi felt light-headed again. Maybe she was still recovering from her near-death experience. Maybe it was her superior officer telling her that he had enough explosive power to glass the surface of a planet. Probably it was both. She took a moment to get her breath back.

"And why?" she asked.

"The high consul's directive for this expedition was twofold," Sagale said. "The first was the mission you were briefed about. You and your team

have done all that could be asked in this effort, and my reports back to naval command reflect this.”

“Okay. Thanks. What was the second thing?” Elvi asked.

“The second aspect of this mission is outside your expertise, which is why it was kept on a need-to-know basis. We were to find a gate-connected system with minimal value. Such as this one.”

She let go of the coffee bulb, and it began gently floating away. “Am I allowed to know what phase two is? Because if I don’t need to know, it seems sort of mean to have this conversation.”

“You are. In fact you are essential to it, and I have every confidence that you will continue to excel as our mission changes, though you will no longer have operational command,” Sagale said. There was something like sympathy in his eyes. For the very first time, Elvi got the sense that Sagale liked her. Or at least respected her. “The high consul’s first priority is to find a way to defend humanity against whatever destroyed the gate builders.” He paused for a moment like he didn’t quite believe what he was about to say. Like he’d been waiting for a long time to say it. “The test we are about to perform is the beginning of that process.”

He tapped at his desk, and a map of the Tecoma system appeared above it. The neutron star at its center, the distant gate, the *Falcon* floating at the midway point, and the two new freighters drifting near the entry point.

“We are going to monitor this system with every instrument at our disposal, just as we always have,” Sagale said. “But this time, out in the hub network, traffic control is running ships through the gates until the energy transfer load reaches the critical state. When the critical level is reached, we are going to transit the empty freighter from this system.”

“You’re going to deliberately ditch a ship?”

“We are. When it vanishes, and while the energy transfer load is still high enough to make transits impossible, I will set the trigger on the antimatter containment field and transit the second ship. It too should vanish, but it will have a timer set to detonate the load.”

Elvi felt her stomach cramp up like he’d punched her in the solar plexus. It was suddenly hard to breathe.

“Why would you—”

“Because one of two things is true,” Sagale said. “Either there is an intelligence that lies beyond those gates that is making the choice to destroy our ships, or there is some natural effect of the gate system itself that does it. This is how we will determine that.”

Elvi reached for a handhold in the bulkhead behind her, and pulled herself to the wall. Her heart was going faster.

“You think you can kill them?”

“That isn’t the issue. Whether something on the other side dies or doesn’t die, what matters is that it is punished. After this experiment, some time later we will run the energy up to the point of another dutchman and see if the ship is taken. If the ship survives transit, we will know the bomb convinced our opponent to change their stance toward us.”

“That’s a terrible plan.”

“If it does change, we’ll know the enemy is capable of change. That it’s intentional, and possibly intelligent. If not, we’ll repeat the test until we’re reasonably certain that no change will be forthcoming. I take it from your expression that you have some thoughts on the mission you’d like to share.”

Elvi’s voice sounded outraged, even to her. “The last time we made them angry, they turned off every consciousness in the Sol system and there was a massive surge in virtual particle activity. They fired a bullet that broke spooky interactions in ways we’re still trying to make sense of. Every one of those things defies our understanding of how reality works. So we’re going to throw a *bomb* at them?”

Sagale nodded, agreeing and dismissing her at the same time. “If we could send a sternly worded letter, we’d try that. But this is how you negotiate with something that you can’t speak to. When it does something we don’t like, we hurt it. Every time it does something we don’t like, we hurt it again. Only once. If it can understand cause and effect, it will get our message.”

“Jesus.”

“We aren’t the aggressor here. We didn’t hit anyone first. We just haven’t hit anyone back until now.”

She could hear Winston Duarte in the word choices. Even in the cadence Sagale delivered them with. It made Elvi want to throw her coffee bulb at his face. Fortunately, it had drifted several meters away, saving her from a court-martial.

“Thanks to you, we’ve found a sample system. This is the safest place in the empire for humanity to conduct these tests.”

“This is a bad, bad idea. I don’t think you’re hearing what I’m saying.”

“When humans first began experimenting with fission bombs,” Sagale said, as if she hadn’t spoken, “they used empty islands for their tests. Consider this our Bikini Atoll.”

Elvi laughed at him, but there was no humor in it.

“My God, you people really are this dumb,” she said. Sagale frowned at that, but she powered on anyway. “First of all, the Bikini Atoll *wasn’t* empty. The people that lived there had their homes stolen and were sent away. And the islands were filled with plant and animal life that was annihilated.”

“We have established that this system has nothing that—”

Elvi didn’t let him finish. “But putting that aside for a moment, I just said whatever lives inside those gates has a very different understanding of physics than we do. Is it limited to taking its anger out on only one solar system? *You don’t know that.* You *can’t* know that.”

“Passivity didn’t save the gate builders. It won’t save us. The high consul has considered the risks and judged a proactive, direct path to be the best option available.”

He spread his hands. *What can be done?* As if Duarte’s word were a force of nature, inescapable and unquestionable. It was like talking to a recording.

“You are about to run an n-equals-one experiment where one is the number of universes we can break trying to satisfy Duarte’s curiosity.”

Chapter Eleven: Alex

The shipyards on Callisto were a perfect example of the old idea that ships and buildings keep learning even after they're built. History took whatever it found and used it for what was happening at the time, remaking the spaces into whatever worked well enough to get by at the moment, until history itself became a kind of architect.

Callisto had been a divided base once. Pretty much the same way medieval villages had been built just outside castle walls, civilian shipyards had grown up around the older MCRN base until the military and commercial concerns were almost the same size. The Free Navy had raided the Martian side even before the Free Navy really existed, pounding that half of the base into dust and bodies. Then, in the aftermath of the great defection that became the seeds of Laconia, the rebuilding of the Martian shipyards had been left incomplete. During the starving years, it had been abandoned. But the real estate was there, and as the need grew again, what had been military structures were taken over again. Nothing died without becoming the foundation for what came after.

They had been on Callisto for eight days so far, and it wasn't certain when they'd ship back out. There were several of the big cargo ships in Sol system that might be able to smuggle the *Storm*, if that was what the underground decided to do next. Or maybe they'd stay in Sol. For all Laconia's ambitions, there were still more people, stations, and ships in the Sol system than outside it. That was changing, though. Someday within Alex's lifetime, they'd cross the threshold, and Sol really would be just one system among many. The oldest, most human system in the empire, sure. But not home. There would be a thousand homes, and if history was a

guide, in a generation or two, everyone would think wherever they were was the most important one.

The restaurant Caspar had taken him to, for example, was in a reinforced dome that had clearly been Martian military construction. A supply depot, probably. Now all the fail-closed locks were gone, and the reinforced walls were hung with batiked cloth and the kind of tapestry that interior decorators churned out by the square meter. The menu billed itself as Moroccan, but the couscous was made with mushrooms and the beef all had the overly consistent grain that meant it had grown in a vat. The recipes might have had their roots on Earth, but Alex knew Belter food when he tasted it.

He and Caspar and the rest of the crew wore printed flight suits with a triangle-and-curve logo that implied they worked for a gas-mining cooperative called Három Állam that worked the Jovian moons. The *Gathering Storm* was hidden in a generations-old mine that was marked on the surveys as having been lost to collapse fifteen years before. It had been an OPA smuggling base, and the plan was to leave it there for a few weeks while the Laconian security forces were on high alert. Which meant, in the meantime, the crew could take a little time off the ship, drink, visit brothels, play golgo and handball and two-court football. Or fold up their legs on soft, woven cushions, listen to flute and drum music from hidden speakers, and scoop up little bits of fungus pretending to be wheat flour and cubes of spiced beef that had never been a cow.

Another advantage was that a little time on Callisto with civilians meant they could take the temperature of the system. See how everyone was reacting to the news of the underground's attack. It turned out the response wasn't what Alex had expected.

"Nothing?" Caspar said.

Alex cycled through the newsfeeds again. Food production on Earth and Ganymede were up this quarter, easily matching the established projections. A group in the Krasnoyarsk-Sakha Shared Interest Zone was petitioning for trade autonomy. The settlement on Navnan Ghar was reporting the discovery of a massive underground crystal network, and a special scientific

commission was being assembled to determine whether it was another alien artifact or something that had occurred naturally on the planet. The lead singer of Tuva T.U.V.A. had sent nude photos of himself to an underage fan, and the authorities were investigating. The Laconian Science Directorate was reporting a potential breakthrough in the survey of dead systems: a massive green diamond that experts suspected might contain records that, if decoded, would spell out the history of the species that had created the ring gates.

That two Laconian frigates and a freighter carrying a critically important political officer had been destroyed in Sol system was listed precisely nowhere.

Or at least nowhere he could see without searching the news-feed indexes. And since Saba had it on good authority that Laconia was keeping a close eye on search terms, Alex was stuck browsing and hoping for something. Anything. But . . .

“Nope,” he agreed. “Nothing.”

Caspar took bit of bread and scooped up a bite of his tagine. “I don’t know if that’s a good thing or a bad one.”

“When I was your age,” Alex said, “it would have been on every feed. Earth and Mars would have had official responses, and there would’ve been eighteen different mainline feeds analyzing every word they said from different perspectives. The Belt would have had a thousand different pirate broadcasts with at least a dozen of them taking credit for it personally, and at least one saying it was all a Jesuit conspiracy.”

Caspar grinned. One of his eyeteeth was a little yellowed. Alex had never noticed that before. “Sounds like you miss it, grandpa.”

Alex looked up, questioning. Caspar put on a comic frown and an exaggerated drawl. “When I was your age, we had to make our own water from scratch every morning and dinosaurs roamed Mariner Valley.”

Alex felt a little stab of annoyance, but he pushed it back and laughed. “There was some variety at least.” He gestured toward the feeds spooling through on the tabletop monitor. “Everything on this feels like it’s been vetted by the same bureaucrat on Luna. It’s all got the same voice.”

“Probably was.”

“Yeah,” Alex said, shutting it off. “It probably was.”

Caspar stretched like a cat waking up from a nap, then tapped the monitor. The newsfeeds vanished and the restaurant’s interface popped up.

“We can split this,” Alex said.

“You buy next time,” Caspar said. “Anyway. Not like it’s real money, right?”

All the *Storm* crew on Callisto had false identities generated by the underground and slipped into the systems. Including biometrics and bank accounts. It was an uncomfortable way to live, knowing that everything was brittle. Alex’s fake records could all be exposed if the Laconian security system raised a red flag. He could spend tonight and then the rest of his life in a jail cell. Everything could fall apart at any moment.

Which, to be fair, had always been true. It was just harder to forget now.

“I’m meeting some of the engineering crew down on the third level. There’s a bar that has open mic comedy and half-price whiskey. Enough karaoke, and a pretty boy like me might even find someone to take him home tonight.”

“Drink one for me, and don’t make any mistakes you can’t regret the next morning,” Alex said, rising from his cushion. “I’ve got some things of my own to do.”

“Fair enough,” Caspar said. “See you when I see you.”

They parted in the corridor. Caspar headed for the passage leading deeper below the moon’s surface, Alex off to the left and toward the docks and the coffin apartments for people on shore leave. People like him. He walked with his hands stuck deep in the flight suit pockets, his eyes on the ground ahead of him. Avoiding eye contact with the people walking in the same halls. The passage came to a Y intersection with a brushed steel sculpture that didn’t seem to know if it was a human or a transport shuttle. Above it, the ships and their berths were all listed. All but his.

When Alex had been a boy back on Mars, his great-uncle Narendra had come to stay with his family for a week once while his group home in Innis Shallows had been renovated. Alex still remembered his great-uncle

walking through the corridors of Bunker Hill with a calm, bemused expression while he and Johnny Zhou explained the fine points of the game they had been playing. Alex felt the same expression on his own face now.

Maybe it was something that happened with every generation, this sense of displacement. It might be an artifact of the way human minds seemed to peg “normal” to whatever they’d experienced first and then bristled at everything afterward that failed to match it closely enough. Or maybe the change that Laconia’s conquest was ushering in was different in kind from what had come before. Either way, the Callisto shipyard didn’t feel like Sol system anymore, or at least not the one Alex knew. It felt like the first days of Laconian rule. The sense of fear and fragility like a ringing in his ears that never went away. Amos used to say that everywhere was Baltimore. That wasn’t true anymore. Now everywhere was Medina.

His coffin apartment was near the docks. It was one of the larger models, a little over a meter high so that he could sit up in it. The mattress was old, recycled crash couch gel, and the walls and ceiling were layered glass and mesh with lights embedded in them to create the illusion of space going out beyond the surface. Alex crawled in, closed the access door, and made himself comfortable. He had a couple new entertainment feeds he’d been thinking about checking out. Over the years, he’d made himself an expert on neo-noir crime thrillers, and there had been work coming out of Ceres even before the Laconian takeover that used Pilkey montage to do some interesting things. He wondered, though, if signing in through the coffin’s system would compromise him. If Laconia knew enough about Alex Kamal to put together the kind of movies he liked, the kind of food he ate, the way he walked, and whatever other data he’d left behind him to pierce the mask that Saba had given him. If he was too much himself, would it send security officers to his door? Did it make more sense to watch something popular and generic and stay at the center of the herd?

He pulled up his profile on the coffin system. A red icon showed a private connection from the *Storm*. There was a certain irony in the fact that he was more worried that Laconia would catch him out because he watched a certain kind of entertainment feed than he was that actual encrypted

communications from the underground would give him away. But there it was. He'd made the decision to trust Saba's old OPA techs when he got into this business. Didn't make sense to start second-guessing them now. He opened the message, and his son looked back at him from the screen.

"Hey, Da," Kit said with a grin that reminded him of Giselle. Kit looked more like his mother than like him. Thank God. "Weird to hear from you again so soon. Are you in-system? I mean, don't tell me. I know we're all hush-hush. But hey. Things are great this semester. I'm pulling top marks in three of my sections, and"—the smile turned rueful—"I've got a good tutor for the other two. And . . . ah . . . yeah. So I'm dating this girl, and I think it's starting to look kind of serious. Her name's Rohani. I haven't told her about . . . um . . . *you*. But if there ever gets to be a chance for you to come meet her? Mom is talking to her family, and I think she may be your daughter-in-law pretty soon here. So it would be good, yeah?"

There was more to the message, and Alex listened to it with a warmth in his chest, and a sorrow. He wasn't going to meet the girl. He wasn't going to attend the wedding if there was one. Rohani would go on the list with Amos and Holden and Clarissa. Another loss. It was just another loss. He'd live with it. He had to.

His hand terminal chimed, and an alert popped up from the false ID that Saba used for high-priority messages. With dread in his gut, he opened it.

BE ADVISED THAT THE TEMPEST HAS BROKEN ORBIT AND IS MOVING TOWARD JUPITER.

"Well," Alex said to himself. "Shit."

"My little man's getting married?" Bobbie said, but she kept looking at the supply crates while she said it. "Girl will be lucky if I don't swoop in and carry him off first."

The warehouse was on the edge of the complex. It didn't use the station's power grid, and the environmental system was a retrofit from an old rock hopper. It left condensation on the walls and ceilings, water

discoloration like leopard spots. The larger gear, like torpedoes, was still on the *Storm*. But the smaller salvage from the Laconian freighter had been transferred onto four wide rows of pallets and moved to the warehouse. Bobbie had unpacked them, scattering the storage crates through the space as she did her own private inventory. Scorch marks darkened some of the boxes. The chalky smell of ceramic that had been heated until it flaked hung in the air.

“You’re taking the news that the largest battleship in the empire is heading toward us very calmly,” Alex said.

She took a deep breath, and kept her voice patient. “Jillian’s getting word to everyone. The *Tempest* is days out, and this work needs to be done one way or the other. I’m hoping by the time I’m done with it, I’ll have a plan.”

“How’s that working for you?”

“Nothing so far. I’ll let you know.”

Alex sat on one of the boxes. He felt heavier than the gentle gravity of the moon could explain. “Bobbie, what are we doing here?”

She paused, looked over at him. She had a lot of different expressions, and he’d come to know most of them. He knew when he was talking to his friend and when she was the captain. Right now, she was listening to him as the woman he’d been on the *Roci* with, back in the day. The one who had known him since before Io.

“Fighting the enemy,” she said. “Degrading their ability to bring force and influence to bear. Denying them the use of resources.”

“Sure,” Alex said. “But to what end? I mean, are we trying to get back to the Transport Union running things? Or are we trying to make it so that every planet is calling its own shots, and then seeing if it all works out?”

Bobbie crossed her arms and leaned against a stack of boxes. The work lights were harsh, and Alex could see all the roughness in her face and arms that decades of hard work and radiation had left. Age looked good on her. It looked right.

“I’m hearing you ask whether authoritarianism is necessarily bad,” she said. “Did I get that right? Because yeah, it is.”

“That’s not what I mean. It’s just . . . I don’t know what it is. I’m feeling overwhelmed. And maybe a little demoralized.”

“Yes,” Bobbie said. “Yes, we are.”

“You too?”

“We lost the target. That political officer might have given us something that could break these fuckers back to the Stone Age. I mean maybe not, but I’m not going to know now. So yeah, I’m a little grumpy. But I’m guessing that’s not exactly what’s biting you?”

“I don’t know what the win looks like.”

“Well, for me, it looks like dying with the knowledge that humanity’s a little bit better off than it would have been if I’d never been born. A little freer. A little kinder. A little smarter. That the bullies and bastards and sadists got their teeth into a few less people because of me. That’s got to be enough.”

“Yeah,” Alex said, but she kept going.

“I’m not a grand strategy girl. That’s for the eggheads. I’m a ground pounder, and I always will be. These people want every planet to be a prison where they get to pick who’s the guard and who’s the inmate.”

“And we’re against that,” Alex said. He heard the exhaustion and agreement in his own voice. “You ever think Naomi’s right? Maybe it’s better to try getting inside the system. Changing it that way?”

“She is right,” Bobbie said, turning back to her inventory. “It’s just I’m right too. Naomi wants there to be one way to fix this, and she wants it to be the one where there’s no blood.”

“But there’s two ways,” Alex said, thinking that he was agreeing.

“There’s no way,” Bobbie said. “There’s just pushing back with everything we’ve got and hoping we can outlast the bastards.”

“You know we’re on the clock here,” Alex said. “I’m thinking about Takeshi.”

“I sent a message to his people,” Bobbie said. “It’s always hard losing someone, and we’d been very lucky up to that point. It couldn’t last.”

“I’m thinking that he was one of your best, and he was damn near sixty. Jillian, Caspar, and a few others aside, our resistance is made up of old

Belters. Old OPA.”

“Agreed,” Bobbie said. “And thank God for that. Most of them have a clue what they’re doing.”

“Behind them is a whole new generation who were never in the OPA. Never fought the inner planets for independence. Who grew up fat and rich on Transport Union freighters, with respect and important jobs. Kids like Kit. How are you going to convince them to give up everything they’ve got and join this fight?”

Bobbie stopped and turned to look at him.

“Alex, where is this coming from?”

“I think we have a resistance right now because we have a lot of old guys who grew up resisting an enemy too strong to ever beat. They’ve been inoculated against fear of failure. But when they’re gone, I think we’re done. As a movement. As a force in history. Because we’re not going to convince anyone born after the Transport Union was formed to fight an unwinnable fight. And maybe, in the long run, Naomi’s plan to win politically is all we’ll have left.”

He saw Bobbie’s eyes go flat. “Unwinnable fight?” she said.

“Well,” Alex said. “Isn’t it?”

Chapter Twelve: Bobbie

In *unwinnable* fight.

Alex was gone, heading back to the *Storm* to figure what exactly their evac options looked like. If they had any. What he'd said stayed after him.

The temporary warehouse their OPA friends had found for them smelled like burnt ceramics and old ice. Bobbie had been working in it long enough now that the smell didn't trigger a gag reflex, so that was sort of a win.

She ticked off an entry on her supply list: twelve crates of Laconian fuel pellets. They'd been intended for the *Tempest*, but they'd work in the *Storm* too. And because the Laconian reactors seemed to want to use only their own brand of pellet, it meant her ship would get to keep flying for a while. Unless the *Tempest* shot them all into atoms. But the *Storm* didn't have a lot of storage space. They'd need to make some decisions soon about how much of their stolen loot to carry with them and how much to hide or sell. Fuel, bullets, or food. The hierarchy of needs, wartime edition. And now, with a *Magnetar*-class dreadnought heading in their direction, the importance of every decision was even greater.

An unwinnable fight.

Bobbie had been at Medina Station when the *Tempest* came through the Laconia gate for the very first time. She'd watched it use its primary weapon on the rail-gun defenses, and turn them into spaghettified atoms in a single shot. And while she hadn't been part of the defense of Sol system when the *Magnetar*-class battle cruiser made its attack, she'd read the reports. The combined might of the Earth-Mars Coalition hadn't even been

able to slow the *Tempest* down. She had no illusions that their one destroyer stood a chance. Run and hide was their only option now.

Alex had been a navy boy for twenty years before he'd become the pilot of the *Rocinante*. He'd always been reliable under pressure. But something had happened when they met with Naomi this last time. Or maybe it was the idea of his kid getting married. Or maybe it was that he was a little smarter than she was, or a little less angry, or a little more realistic. Maybe it was that he'd seen a little sooner than she had why the fight was unwinnable. The underground was held together with spit and baling wire even at the best of times. Saba did what he could to help the old OPA fighters keep the Laconians uncomfortable where they could, but the simple truth was that the *Storm* was their only meaningful asset. The ship, and by extension her strike team, were the resistance's only real weapon against Laconia. The Transport Union didn't have gunships, and the void cities had been disarmed as part of the treaty negotiations. The Earth-Mars Coalition fleets couldn't help even if they wanted to now that they all had Laconian flag officers on them reporting directly to Admiral Trejo.

If Alex was losing heart, Bobbie didn't believe for a second he was alone. The failure to capture the political officer combined with the looming threat of the battleship might be enough to get her crew wondering why they were still risking their necks fighting an unbeatable foe.

And as much as she disliked it, Alex was right.

The old-guard OPA attitude of resistance for resistance's sake would only keep them going so long. Part of what she should be doing was training up the next generation of fighters. Only so far, they weren't waiting in the wings to step in. Duarte and his people were smart. They kept things from getting bad too quickly. They made the right speeches about respect and autonomy. They let people believe that government by a king would never go wrong. And by the time it did, and things got bad enough to inspire a younger resistance, she and Alex and the old-school OPA would be off the board. Then who would be left to fight? Why would they think there was any hope in it?

Recruitment wasn't her job. It belonged to Saba or Naomi or one of the other secret leaders of the underground, but she couldn't stop thinking about it. Alex had opened the issue. Now it itched.

Bobbie finished her check of the fuel cell crates and moved on to something the manifest listed as sensor components. The team had grabbed it off the freighter because any repairs the *Storm* needed were done in-house and on the fly. Spare parts were always at a premium.

Inside the crate was a sealed gray ceramic box about the size of a toaster with seven input ports on its side. Bobbie used her terminal to look up the serial number on the case. It was listed as an active sensor array control node—the little processing station that coordinated data coming in from the radar and ladar sensors, did first-level analysis, and acted as the hindbrain between the main computer and the sensors themselves. An expert pattern-matching system about as smart as a pigeon. If they were sending a new one to the *Tempest*, it might mean that they'd lost one in the fight for Sol. It was a nice idea, anyway. That the big dreadnought had taken some damage in the fight it couldn't just heal for itself. And it made sense. The weird hulls and reactors and engines of the ships might heal like the ship was a living thing, but they were protomolecule technology. The sensors and computers on the Laconian ships were human tech. Anything built by humans had to be hand repaired or replaced. It was one of the few weaknesses of the hybrid ships.

And if she had the replacement parts, it might mean there was a hole in the *Tempest's* sensor package. If they could figure out where it existed, maybe they could get close to the big ship before detection. They could . . . fire one meaningless torpedo before the big bastard swung around and ripped them into atoms. Paint something rude on the hull. Pee on it. Jillian's crack about moral victories was annoying, but that didn't make her wrong.

Bobbie put the sensor node back into its case and marked the box as one to definitely keep for themselves. An hour later, she'd finished going through the pallet of spare parts and tagged them all as keepers. Her terminal was playing a little three-dimensional game of "fit all the loot." Every time she marked a crate, the program shuffled everything in the

Storm's storage compartments looking for a place to put it. At some point, they'd have to start storing things in the staterooms and hallways, and that point wasn't far off.

She opened a crate of protein flavorings for the galley food processor and marked it DO NOT KEEP. She started to close it, then sighed and changed it to KEEP. The terminal played its little space-shuffling game. An army marches on its stomach, the ancient saying went, and people who were risking their lives for the cause should probably be able to have a tasty meal every now and then.

It was interesting, though, that the *Tempest* was coming after them. It felt good to know she'd hit the enemy hard enough to sting. Maybe it was just pride. Admiral Trejo angry that a pirate would dare act in his solar system. Or maybe the political officer had been close enough to someone high in command that this was a personal vendetta now. Or maybe they just really wanted their protein flavoring back. Whatever it was about the raid that made Laconia jump, she hoped they were as bothered and itchy as she was.

She reached the end of her row of pallets, which meant her work was half-done. A few more hours digging through boxes, and she could sneak off to one of those old bars at the port and drink her troubles away. Or at least distill them down to nausea and a hangover. And maybe she'd get a steak. She felt like Saba and the resistance could afford to buy her a steak. Her stomach rumbled at the thought. So maybe she called it a day now, and came back to finish tomorrow.

A small pile of high-impact crates had been set off to the side, away from the main rows of pallets. They had a variety of warning labels on them, so her crew had put some space between them and the rest of the supplies. All right. Go through the dangerous stuff now, *then* call it a day.

The top crate in the pile had a caustic chemical warning, and was filled with spray cans of degreaser. Not exactly a threat to life and limb. She moved the crate over to the regular supplies. Beneath it was a crate marked HIGH EXPLOSIVE that had reloads for the rocket launchers the Laconian

power armor could attach. She marked that one as definitely keep and set it aside.

Under that was a large metal crate. The label said MAGNETIC CONTAINMENT EXPLOSIVE DANGER. That was odd. None of those words seemed to go together in a way that made sense to her. She checked the serial number on the side of the crate with her terminal, and it came back ID not found.

Curiouser and curiouser.

Nothing on the crate indicated that opening the latches was hazardous, so Bobbie popped them and lifted the lid. It was much heavier than it looked. Lead lined, maybe. Inside, cradled by enough foam to keep a robin's egg intact during high-g maneuvers, were four metallic spheres about the size of Bobbie's two fists held together. All four had cables running to a massive power cell that gave off a low hum of high electricity. The power cell's indicator showed that it was at 83 percent charge. Each sphere had its own indicator where a cable from the power cell connected to it. They all showed 100 percent.

Bobbie very carefully lifted her hands away from the box and took a step back. Nothing in the box itself looked all that dangerous. Just four big metal balls and a high-capacity battery. But every hair on her body was standing straight up. It was all she could do to stop herself from running away.

Bobbie knelt back down next to the crate and very gingerly lifted one of the metal balls out, making sure to keep the cable connected to the power supply. Once it was out of its foam cradle, warning text could be seen. ENSURE MAGNETIC CONTAINMENT SYSTEM REMAINS CHARGED—DANGER OF EXPLOSION, it said. Another, smaller warning read, DO NOT RUN ON INTERNAL POWER SUPPLY FOR MORE THAN TWENTY MINUTES. The labels on it were from the Laconian Science Directorate. Not military, except in that everything Laconian was military. Not usual ordnance, anyway. Nothing familiar.

Bobbie returned the sphere to its place in the foam. And sat back. Something in the spheres exploded when it wasn't magnetically restrained.

Fusion reactors worked that way. The magnetic bottle held the fusion reaction suspended because nothing material could handle the heat of the core. These little spheres weren't reactors, though. A fusion reactor was huge. It required extensive support mechanisms to inject fuel pellets, compress and fuse those pellets, and turn the fusion reaction into electricity. The Laconians were advanced, but it didn't seem plausible that they were so advanced that they'd created fusion reactors a little bigger than a softball. And these things were using power, not generating it.

She pulled out her terminal and called Rini Glaudin. She was an old Belter on the *Storm*. A high-energy physics PhD from way back in the day at Ceres Polytech who'd gotten radicalized in college and spent a couple of decades in a UN prison after she started helping the Voltaire Collective build bombs. Now she was the chief engineer and resident gearhead on the *Storm*.

"Boss," Rini said after a couple moments. She sounded sleepy, or drunk.

"Catch you at a bad time?"

"You can leave now," Rini said, but her voice was muffled, like she'd covered the mic with her hand. A minute later, "What is it?"

"I have a weird question, but if you had company," Bobbie said.

"He's gone. He was pretty enough, but postcoital conversation was not his strong suit. What's going on?"

"I'm going through the loot we pulled off that freighter," Bobbie said. "And I found this crate of stuff I'm having a hard time identifying. Thought maybe you could help."

"You're at that warehouse by the surface? Let me pull on some clothes and I'll get right down there."

"No," Bobbie said. "Don't do that. I think this might be dangerous and I don't want anyone in here until I figure it out. Hold on, let me send you some video."

Bobbie passed her terminal across the crate, giving Rini a good look at the power cell and the spheres. Then she propped the terminal up against the edge so she could use both hands to pick up a sphere and show the warning text to the camera. When she was done, she said, "Any ideas?"

There was a long pause. Bobbie felt the unease rising in her like an illness.

“Fuck me,” Rini said at last.

“What do you think it is?”

“So the big question about the *Magnetar*-class ships has always been power,” Rini said. There was a lot of background noise as she spoke, drawers opening and closing. Clothes being pulled on. She was dressing in a hurry. “The stars the ships are named after have incredible magnetic fields, but they’re rapidly rotating neutron stars, so how do you get that beam effect the ships have without, you know, spinning up a neutron star?”

“Okay,” Bobbie said. Her knowledge of astrophysics was pretty thin. “How do they?”

“No one knows!” Rini said. “But it would take way more power than a typical fusion reactor puts out. Everyone just sort of assumed that meant the Laconians had much better reactors than us. But we have the *Storm*, and our reactor is good, but its design is nothing paradigm shifting.”

“I’m sitting right next to this thing while you talk,” Bobbie said, “so go faster maybe.”

“Antimatter results in a one hundred percent conversion of matter into energy. Nothing else even comes close. If the Laconians power their beam with antimatter, that actually makes sense.”

Bobbie laughed. There was only a little mirth in it. “Am I sitting next to four bottles of antimatter, Rini?”

“Maybe? I mean, the only way to contain it would be a magnetic field. If it touched anything, boom. So, sure? Maybe.”

“How much of that stuff do you think is in here?”

“I don’t know. A kilo? A gram of it would be a bomb big enough to level a city. Based on the size of those orbs, you’ve probably got enough there to punch a hole in this moon. I mean, if that’s what’s in there.”

“All right,” Bobbie said. “Thanks. I’ll be in touch.”

“Fuck that, I’m on my way down there,” Rini said, then killed the connection. At least Bobbie understood now why the *Tempest* was treating

this as high priority. Looking at the metal balls in their case was making Bobbie's scalp crawl.

And then, all at once, it wasn't.

The fight had just changed. And she knew how to win.

Chapter Thirteen: Naomi

The question is,” Saba said on Naomi’s monitor, “why did they have a political officer in the first place, que no?”

The *Bhikaji Cama* was on the float, and still half a week from a gentle quarter-g braking burn that would take weeks before they reached the transfer station at Auberon. With the drives on the ship, they could have done a full g the whole way, but efficiency and speed weren’t always the same thing. Carrying the reaction mass to accelerate and brake that hard would have meant giving up more of the cargo space. Maybe someday the Laconian technology would overcome the constraints of inertia—the protomolecule had been doing so since Eros—but for now that mystery was still a mystery, like so many others. Where did the ships that went dutchman end up? What would draw the attention and anger of the thing that had destroyed the protomolecule engineers?

Or, on a smaller level, why had a Laconian political officer been riding on a Transport Union freighter?

News of the failure had been slow coming to her. The first report had been sketchy and brief, and said little more than that the raid had gone pear-shaped. Political officer, the informants on the freighter, and one member of the assault team lost. The next thirty-four hours had been a thin slice of hell as she waited for the full after-action report, certain beyond doubt that Bobbie had been the one who’d died.

Only it hadn’t been her. One of her crew was dead, and her mission objective had slipped through her fingers, but Bobbie and Alex and the *Gathering Storm* lived to fight another day. The death of the political officer was just one of the stupid, random tragedies that happened anywhere,

anytime, but significantly more often during battle. If he'd lived, they'd know much more about what he'd been doing. As it was, they were down to educated guesses.

"We have confirmation that he was on his way to the Transport Union's transfer station at Earth," Saba said. "But whether that was a permanent placement or a stop along a longer path . . ." He shrugged eloquently.

Naomi stretched. She liked the freedom of free fall even though it meant doubling up her exercise routine. Or maybe because it meant that. More hours in the resistance band meant at least doing something physical. Feeling her body. And also there was a sense of being where she belonged. From the recording, she could tell that Saba was someplace with a steady gravity. The last four communications from him had all been the same, so a spin station or a mass large enough to hold him down. No one was on a steady burn for that long.

It wasn't really a surprise that something was happening on Earth important enough to warrant a dedicated representative at the transfer station. Apart from Sol's permanent role as humanity's original home, it was still the largest population center in the gate network. And Earth had the largest population of any planet. Even with settlements like Auberon and Bara Gaon Complex growing, there would never be enough ships or shipping to make a dent in the billions still left on Earth. But what exactly was on Winston Duarte's mind about Sol system was an important question. And one that they could have answered, if luck had broken their way just a little bit more.

She considered, rubbed her eyes, and hit Record. She'd edit her response down before she committed it to a torpedo, but just saying the words helped her think. And she could pretend she wasn't quite as isolated and alone as she was.

"The loss of our informants on the ship is going to be important," she said. "Without them, we wouldn't have known that the political officer was there in the first place. And if they hadn't spoken up, they'd still be alive. Not the best argument for working with us. Their families need to be taken

care of, and by us. Not Duarte's people. Otherwise we'll see fewer of these tips in the future."

It's always about relationships, Jim said in her imagination.

"It's always about relationships," she said. "And we have to hold up our end of the bargain. Take care of our own. To the other point, if we're going to find what Duarte's doing there, we need to get one of ours on the transfer station. Either find someone already on staff sympathetic enough to feed us information or someone who can be inserted into the administration. Trying to get the *Storm* to intercept another freighter is too high a risk."

But she thought it was possible that someone from the *Storm* could act as an agent of the underground on TSL-5. She wondered if Bobbie would go. Part of her thought she would. It was the dangerous assignment, after all. But Naomi also couldn't quite imagine her giving up command of the *Storm*, even for something important.

But she was getting ahead of herself.

"Before we take any direct action, we should finish a full inventory of what was on the freighter. If there were any supplies or equipment on it that were out of the ordinary, that might—"

Her system threw out an alert, and Naomi's heart leaped despite her better judgment.

It was a new message from Jim.

Duarte had been doing this almost since Jim had been taken to Laconia. Not quite public announcements, though there had been some of those too. Broadcasts sent out and picked up on passive with an old, compromised encryption scheme. Someone would have to want to know what was in them, anyway. The security wasn't the issue so much as a signature. An address. Here was a message that Laconia could spread through every system in the gate network, but only she could watch it. Or only she and the *Roci*. Or someone else who'd taken the time to crack the *Roci*'s old codes.

It was a private message, then, between Jim and her and every high-end government censor on Laconia. She had a vague memory about nobility on old Earth having witnesses on important wedding nights to watch the newlyweds fuck. This felt about as dignified.

And still, there was nothing under any sun that would keep her from playing it.

The message began with the blue wing-shaped crest of the Laconian Empire, a test tone, and then there he was. Jim looking into the camera with a mild amusement that most people wouldn't recognize as a variety of rage. He had on a collarless shirt, and his hair was combed enough to show where his hairline was starting to pull back a little. Anti-aging regimens had pushed human life from the three-to four-decade range of prehistory to four times that, but wear and tear still counted for something. Jim had suffered more than his fair share of punishing life experiences. And then the fake grin ended and he really smiled, and the decades fell away. Even before he spoke, she heard him. The mix of sorrow and amusement in his eyes, like a guest at a party that had gone so wrong that the travesty had lapped itself and become a little bit fun again.

She stopped the playback as he opened his lips and took the moment with him. Even just the picture of him. Then, steeling herself, she started the message.

"Hey there, Knuckles. Sorry it's been so long this time, but things got a little busy over here. I'm guessing you heard about Avasarala? The funeral brought in a lot of other guests to the palace."

Using the nickname Knuckles, which he never had when they were together, was the signal that he knew they were still hunting her. She also heard the ghost of sarcasm in the way he said *guests*, but the censors hadn't. There were real challenges to controlling communication between two people who'd been intimate for as long as she and Jim had been. The private language between them couldn't be perceived by bureaucrats, and what couldn't be seen couldn't be stopped. The story of her life, these days.

"There's still not much I can say. You know how it is. Uh. I met the guys who actually review this before it goes out. So hey, Mark. Hey, Kahno. Hope you guys are having a good day too. But yeah, things are fine here. Some rain in the afternoon, and Laconia's getting on toward what passes for midsummer. They're letting me have a lot of access to the grounds and I'm catching up on my reading. Mark and Kahno say I can't talk about what I'm

reading in particular, but it's nice to have access. I'm also watching the newsfeeds, and the things that Duarte . . . They want me to call him High Consul Duarte, but really it seems pretentious. Anyway, the work he's doing about figuring out the gates and what happened to the protomolecule engineers is actually pretty impressive. We disagree on other things, but he's on the job with that. Which, you know. Hopefully . . .

"But I hope you're okay. Give the kids my fond regards, and I'll send you another message as soon as Mark and Kahno have an open slot in their schedule. They're good guys. You'd like them. I love you."

The image cut to blue, and Naomi let out her breath. It always hurt to see him. And *the kids* meant Alex and Bobbie and Amos. He had no way to know Amos was lost to them, probably killed on the same planet where Jim was being held prisoner. Or that Bobbie and Alex were off leading the fight on the front lines as pirates and revolutionaries. But even with all of that, hearing him always made her feel a little better too. It was as near to proof of life as she'd get. He didn't look sick. He didn't sound like he was under duress—

The image changed again, and a new face appeared. A man with dark eyes, acne-scarred skin, and a calm in his expression that landed him directly in the uncanny valley. Naomi found herself pulling back from the screen even before she realized who she was looking at. High Consul Winston Duarte, emperor of thirteen hundred worlds, smiled as if he'd seen her reaction and sympathized with it.

"Naomi Nagata," he said, and his voice was pleasant and reedy. "I know I don't usually insert myself in these messages, and I hope you'll forgive me this rudeness. I don't mean to intrude, but I think we should talk, you and I. I want to extend an invitation to you. Contact any of my security people on any station or base or city, and I will have you brought safely here. I understand that you and your fellow partisans don't see eye to eye with me about the shape that humanity should take moving forward. Come talk to me. Convince me. I'm not an unreasonable man, and I'm not a cruel one. The truth is, over the last few years Captain Holden and I've found we have much in common."

Naomi chuckled despite herself. *Sure you did.*

“You’ve seen how Holden is treated. If you come as my guest, you’ll have all the same courtesies and comforts, and you’ll have access that will let you advocate for the changes you want without the violence and death. I know we haven’t met, but everything Holden has told me says you’re more than some old-fashioned anti-government extremist. He believes in you, and he has convinced me to believe in you too. Accept my offer, and you and Holden can be eating breakfast together before you know it. He’ll tell you himself I’m a decent host.”

He made a self-deprecating smile. *Carrot done*, Naomi thought. *Now stick.*

“If you choose not to, that is your right. But as an enemy of the state, the consequences will be less pleasant. It’s going to be better for you and for me and—excuse me if this sounds grandiose—for the whole of humanity if you come as a guest. Please at least consider the option. Thank you.”

The message ended. Naomi shook her head once, tightly, and held on to her anger like it was a vaccine against something worse. Whether Duarte said it or not, the offer included trading all she knew of Saba and the underground. In return, she would be waking up next to Jim, living in a prison a thousand times larger than the one she’d imposed on herself. That was all obvious. The poison was the rest of it—access, influence, the emperor’s ear. It was exactly the path she’d argued for. Working within the system to make a revolution without starvation and hatred and dead kids. He was offering it to her on a plate, and it was possible—just possible—that he was even sincere.

Everything Saba had learned through his sources said that Jim really was being treated well. A guest as much as a prisoner. That was the cheese in the mousetrap. It was cunning almost to the point of wisdom. If she believed in her heart that Duarte would break his word, it would have been a thousand times easier to reject him. But all the stories about the devil making a deal and then cheating missed the point. The real horror was that

once the bargain was struck, the devil didn't cheat. He gave you exactly and explicitly all that had been promised.

And the price was your soul.

The knock startled her. It was like something from a different world. A moment ago, she'd been on Laconia. Eden, complete with a snake. And now she was back in her box, floating a few centimeters above the gel of her couch, the straps drifting around her like seaweed wrapping the drowned. She shifted her monitor to show the exterior of the container, half-afraid to see the *Bhikaji Cama*'s security chief ready to take her in, half-hoping.

The woman outside gripped a handhold and looked straight into the hidden camera. A black zippered duffel floated beside her. She was heavysset, with gray-streaked hair pulled back into a harsh bun and dark skin that got darker around her eye sockets like she'd cried too long and it had stained her. Naomi recognized her as Saba's agent on the ship, but didn't know her name.

Naomi pushed off from the crash couch, drifting fast toward the far end. She landed feetfirst, absorbing her momentum with her knees, and tapped her security code into the mechanism. The mag bolts clacked. In the silence, they sounded like gunshots. Before Naomi could open the door, the other woman did. She slid through, pulling the black bag with her, then shut the door behind her and glanced around the container as if there might be something unexpected in it.

"What's the matter?" Naomi asked.

"Captain got a call middle of last shift," the woman said in a clipped accent that sounded European to Naomi. "Took me longer than it should have to get a copy. That's on me."

She shoved the bag at Naomi. Even without opening it, the shape of mag boots and the hiss of a flight suit were unmistakable. Naomi didn't wait. She slid the zipper open and started pulling the uniform on over her own clothes while the woman talked.

"Laconian destroyer burning in for a rendezvous. Should be here in eighteen hours. Say they're going to make a full inspection, so alles la—"

She gestured at Naomi's things. The home she'd made for herself. "Yeah, we're going to have to get clever about making that match the manifest."

"Inspection?"

"Full," the woman said. "This is all supposed to be bacterial samples. They see this . . ."

If they saw the false container, they'd know how the underground was staying hidden. And that some fraction of the Transport Union was in on the scheme. It might not be the end of the shell game, but it would be a data point too clear for Laconia to overlook for long. And it would be the end for her.

"Is it only us?" Naomi asked.

"Does it need to be more? Us is our problem. Focus on—"

"No," Naomi snapped. "I got an offer of amnesty if I turned myself in. This just after that? Are they coming for other ships, or do they already know I'm here?"

The woman's face went gray. "Don't know. I can find out."

"Do it fast. And get me a loader. I'll try to find a way to cover this over."

"Yeah," the woman said. "And crew manifest. I got to put you in somehow—"

"Not the priority," Naomi said.

"But . . .," the woman said. Then, "Right. All right."

Naomi looked around her container. It seemed sadder now that she had to leave it. She'd have to wipe the system, just in case she was taken. All her belongings would have to go too. She'd be starting over from nothing again.

Or she could go to the security office, announce herself, and spend the rest of her life waking up next to Jim. Eating real food. Maybe even talking Duarte into a better, kinder, less authoritarian future for all of humanity. If it was a trap, it was a good one. Offer her an out, make the threat, and then tighten the screws. If she'd been younger, it might have been enough to panic her. Convince her to announce herself. Sign the deal. It would be easy, and she could even tell herself that she was protecting the

underground and the people like the woman before her. She'd only tell Duarte things that wouldn't compromise Saba and their network. That wouldn't threaten Bobbie and Alex and the *Storm*.

She could imagine the version of herself that would have been able to do it. Not so different from who she was now. Younger. That was all.

"Emma," the other woman said. "We're going to pass you for crew, you'll need to know names. I'm Emma Zomorodi."

"You can call me Naomi."

"I know who you are," Emma said. "Find me someone who doesn't."

The woman—Emma—looked at her again, more closely, then turned away, shaking her head. The fear in her expression was thick enough to see. *It's okay*, Naomi wanted to say. *I know what to do. It'll be all right*. It would have been a lie.

"Come on," Naomi said. "We don't have time."

Chapter Fourteen: Teresa

Yes,” Teresa said. “I know. Okay. Let me get ready.”

Muskrat barked once as if she’d understood the words. Probably she had. Dogs could have broad functional vocabularies. It was a point Dr. Cortázar often made. The fact that humans were not the only conscious animals seemed very important to him. It had always seemed obvious to her.

Teresa set her room to high privacy and sleep, dimming the lights and locking her doors. No one would disturb her now unless they were evacuating the State Building. Muskrat wagged hard enough that her back legs looked unsteady as Teresa changed into the same simple tunic and pants she normally used for gardening. They had no technology, so they weren’t connected to the palace network. She started up an entertainment feed on her system on low volume as if she were dozing and watching an old Caz Pratihari adventure.

Her window had a sensor in the frame that alerted a security officer when it was opened. So Teresa had opened it every now and then over the course of weeks, trying different ways to get around it. Was it electronic? She tried keeping the window and frame touching with a copper wire. Security still got their alert. Optical? She searched everywhere for anything resembling a pinhole camera or light sensor, but never found one. Motion activated? She tried opening the window very slowly over the course of days, but on the fifth day security got their alert. Not motion sensing, and it only went off when there was an eleven-millimeter gap between window and frame. Interesting.

It had turned out to be magnetic. A low-strength magnet in the window, when moved too far from a sensor in the frame, set off the alert. She'd solved this by using a plastic letter with a tiny magnet in it from her preschool alphabet set. Moving it a little bit every time she tried to open the window, until one time she opened it and no one showed up outside to make sure she was okay.

Now she slid her magnet to the correct spot, manually undid the window, and lifted Muskrat carefully out. She climbed out after, pulling the frame closed behind her. Muskrat chuffed and started off along the path to the edge of the palace, and Teresa followed behind.

It had been too long. It was time to go see Timothy.

She'd found the secret tunnel almost a year before. It was hidden by a rock in a group of ornamental trees. She'd initially thought it might have been dug out by some local animal. There was a kind of underground wasp that left holes that looked similar to it when they died and their hives collapsed. It had turned out to be part of a flood relief system to make sure the gardens never drowned in heavy rain. It led under the walls of the State Building compound and into a small field beyond. Intellectually, she knew that a normal girl might not have gone down the tunnel with the spearmint smell of broken ground and the thin coat of slime. She had pushed through easily, joyfully even, and a few dark moments later had found herself on the far side of the perimeter and free for literally the first time in her life.

She'd gone walking. Exploring. Discovering. Engaging in developmentally appropriate rebellion. And, most importantly, she'd made her first real friend.

Animals had made the path she and Muskrat followed through the forest. Bone-elk and ground pigs and pale, shovel-faced horses, none of which had any relationship to Sol system elk or pigs or horses. She walked down the path, her hands in her pockets. Muskrat bounded through the dappled shade, barking at sun-birds and smiling a wide tongue-lolling grin when they hissed back. It had been too long since she'd been to see Timothy, and she had too much she wanted to talk with him about. It wouldn't all fit in her head at the same time.

The forest at the edge of the State Building thickened at first, the gloom growing around her, and then the land began to rise. She started feeling her breath get deeper, and it felt good. Before long, the path led out of the trees entirely and into a clearing at the skirt of the mountain. She knew from her studies that the mountain wasn't natural but a kind of artifact of some long-forgotten alien project. Like a sandcastle, but tall enough that the top seemed to touch the clouds. Not that she'd ever been to the summit. Timothy's cave was much closer than that.

The entrance was in a little canyon not far from the clearing where she'd first come upon him. Muskrat knew the way better than she did. She walked down the pale sand along the path carved by water that had long since dried. Wide, fresh Labrador paw prints marked her way. By the time Teresa left the last scraggly trees behind, the dog was already at the bend that led there, barking and wagging her tail.

"I'm coming," Teresa said. "You're such a pain."

Muskrat shrugged off the insult, turned, and bounded ahead like a puppy. Teresa didn't see her again until she stepped under what looked like an overhanging shelf of sandstone and into the deeps of the cave. The natural stone gave way almost immediately to the soft glow of the cavern. Stalactites hung from the ceiling like bright icicles, and the walls were built with swirls and shapes in them like a seashell and a Euclidian proof had joined together and become an architect. Teresa always had the feeling that the walls changed to greet her, but of course she was only there when she was there, so she couldn't be certain.

A flock of tiny, glowing gnats flowed past her like a wave. Like she was underwater. The air smelled thick and astringent, and a coolness radiated from the walls.

Soft padding sounds came from ahead. Not human sounds, and not Muskrat either. The footsteps weren't even animal, not really. The repair drones were a little smaller than Muskrat, with dark, apologetic-looking eyes and multiply jointed legs. Totally alien, but they were the closest things to canine friends that Muskrat had, and the real dog ran around them, yipping excitedly and sniffing their rears as if there were anything doglike

to smell back there. Teresa shook her head and moved forward. The repair drones made their query tone, trying to intuit whether Muskrat wanted something. The drones were surprisingly good at judging at least the rough intentions of humans. Real dogs still seemed to baffle them.

The repair drones, the light gnats, the slow, creeping, wormlike stone diggers were all in the weird space between life and not-life. Designed by an intelligence that evolutionary forces had taken in a direction very different from humanity. They weren't exotic to her at all. As far as Teresa was concerned, they'd always been there, just like that.

"Hello!" Teresa called. "Are you here?"

The words echoed weirdly out of the deepness. "Hey, Tiny. I wondered when you were coming back."

Timothy's part of the cave was like another phase change. Nature to alien to human, if not exactly the kind of human residence she was used to. A backpack reactor leaned against the wall, thick yellow power cords going to a wooden rack of neat, well-maintained machines. She recognized the yeast incubator and the emergency recycler from her tours of the early settlements. Other decks she didn't know. All together, it was enough that Timothy could live like a monk and a wise man in his mountain for more than a human lifetime. His bed was a cot against one wall with a blanket of woven polycarbonate that seemed never to show wear. He didn't have a pillow.

The man himself sat next to a length of wood, a knife in his thick, callused hand. A pile of thin, curled slivers rested between his feet where they fell as he carved. He was bald and pale, with a thick, bushy white beard, wide shoulders, and arms with muscles like ropes.

She'd come across him months ago during one of her first excursions. She'd been trying to get high enough on the mountain to see the State Building, and there he'd been, eating his lunch and drinking from a scarred ceramic water purifier. He'd looked like nothing so much as an old cartoon of an enlightened guru meditating on a mountaintop. If there had been any threat in his smile, she might have been scared of him. But there wasn't, and she wasn't. And anyway Muskrat had liked him immediately.

“Sorry,” she said, sitting on the edge of his cot. “I’ve been busy. I have a bunch of new things I’m studying. What are you working on?”

Timothy considered the half-carved wood. “I was going for a marking gauge. I’ve got one already, but it’s a little big for the fine work.”

“And you can’t have too many tools,” Teresa said. The phrase was something of a joke between them, and Timothy grinned.

“Damned straight. So what’s up?”

Teresa leaned forward. Timothy frowned and put down the wood and the knife. She didn’t know where to start, so she started with her father’s plan to train her up.

He had a way of shifting his attention so that she felt like he was actually listening, not just preparing a reply in his head and waiting for her to stop talking. He focused on her the way he did on the wood he carved or the food he cooked. He didn’t judge her. He didn’t quiz her. She never worried that he would be disappointed with what she said.

It was the way she imagined her father would listen to her if he weren’t her father.

She wandered from topic to topic, telling Timothy about Connor and Muriel, the briefings and meetings her father was adding to her schedule, and all the day-to-day worries and thoughts that had built up without her even knowing, and ending with the unnerving conversation with Holden the dancing bear and the weird way he’d said *You should keep an eye on me* like it meant something more than it seemed . . .

When she ran out of words, Timothy leaned back and scratched his beard. Muskrat had curled up on the floor between the two of them. The dog snored softly, and one leg twitched as she dreamed. Two repair drones queried each other, their voices clicking in descending musical tones. Just telling the story left her feeling better.

“Yeah,” he said after a while, “well, for what it’s worth, you’re not the first person that felt like the captain was a splinter they couldn’t dig out. He has that effect on people. But if he says you ought to keep an eye on him, maybe you ought to keep an eye on him.”

Teresa leaned back against the wall and pulled her knees up. "I just wish I knew why he bothers me so much."

"He don't treat you like you're special."

"You don't treat me like I'm special. We're friends."

He considered that. "Maybe it's because he thinks your dad's an asshole."

"My dad's not an asshole. And Holden's a killer. He doesn't get to judge other people."

"Your dad's kind of an asshole," Timothy said, his expression philosophical, his voice matter-of-fact. "And he's killed a lot more people than Holden ever did."

"That's different. That's war. He had to do it or else no one would have been able to organize everyone. We'd just have stumbled into the next conflict unprepared. My dad's trying to save us."

Timothy held up a finger like she'd made his point for him. "Now you're telling me why it's *okay* he's an asshole."

"I don't—" Teresa started, then stopped. Timothy's comment made her think of a philosophy lesson, and Ilich talking about consequentialism. *Intention is irrelevant. Only outcomes matter.*

"I don't tell anyone how to live," Timothy was saying. "But if you're looking for moral perfection in your family? Prepare for disappointment."

Teresa chuckled. If anyone else had said the same thing to her, she would have bristled, but it was Timothy. That made it okay. She was glad she'd made the time to come out to see him.

"Why did you call him captain?"

"That's who he is. Captain Holden."

"He's not *your* captain."

A flash of surprise passed over Timothy, like it was a thought he'd never had. "I guess he ain't," Timothy said, and then a moment later, and more slowly, "I guess he ain't."

"Dad says he's afraid," Teresa said. "Holden is, I mean. Not Dad."

"They both are," Timothy said, picking his knife back up. "Guys like them always are. It's people like you and me that aren't scared."

“You’re never scared?”

“I haven’t been scared since I was younger than you, Tiny. I had a rough start.”

“Me too. My mom died when I was a baby. I think my father doesn’t like having women around me because it feels like replacing her. All my teachers have been men.”

“I never knew mine either,” Timothy said. “But I put something together later that I could sort of pretend was family. It wasn’t bad for someone that grew up on my street. While it lasted. I’ll tell you what, though, as fucked up as my childhood was? It’s got nothing on yours.”

“My life’s perfect,” Teresa said. “I can have anything I want. Anytime I want it. Everyone treats me well. My father’s making sure I have the training and education to govern billions of people on thousands of planets. No one has ever had the advantages and opportunities I have.” She paused, surprised by the hint of bitterness that had crept into her voice.

“Uh-huh,” Timothy said. “That’s why you’re always looking over your shoulder when you sneak out to see me, I guess.”

That night, back in her room, she couldn’t sleep. The small nighttime noises of the State Building took on a weird power to distract and startle her. Even the gentle ticking of the walls as they radiated away the day’s heat felt like someone knocking for her attention. She tried turning her pillow to press her cheek against the cool side and playing gentle, soothing music. It didn’t help. Every time she closed her eyes and willed herself down toward dream, she found herself five minutes later with her eyes open, halfway through an imaginary debate with Timothy or Holden or Ilich or Connor. It was past midnight when she gave up.

Muskrat rose with her, following her from bedroom to office, and then, when Teresa sat on one of her workbench stools, curled up at her feet and fell immediately to snoring. Nothing bothered her dog, or at least not for long. Teresa pulled up an old movie about a family living in a haunted

apartment on Luna, but her mind slid off the entertainment as quickly as it had off the pillow. She thought about going out and walking around the gardens, but that annoyed her too. When she realized what she actually wanted to do, she'd already known it for a while. Admitting it to herself felt like a surrender.

"Security log access," she said, and her room's system shifted from the haunted corridors of Luna to a businesslike user interface. Even as honored and important as she was, there were logs that she didn't have access to. No one except maybe her father and Dr. Cortázar could have access to the recordings from the pens, for instance. That was normal. And it didn't matter for what she needed. No one was worried about preserving Holden's privacy. She could have watched him sleep if she'd wanted to.

She set the system to generate a full track for Holden over the past week, then scrubbed through it. She knew that the State Building had ubiquitous surveillance built into it, but it was interesting to see where exactly the microlenses were and how much they could capture while staying invisible themselves. As she scrubbed through Holden's passage in the buildings and the gardens, she thought about all the other things she could watch on the feeds. Connor and Muriel, for instance.

On one of her screens, Holden sat on the grass, looking out at the same mountain where Timothy lived. The accelerated scrubbing made his casual gestures and adjustments seem spasmodic. Like he was vibrating. Then Muskrat was there with him. Then she was. She didn't like looking at herself on camera. She didn't look the way she felt like she did. In her mind, her hair was smoother and her posture was better. Without meaning to, she shifted on her stool to sit up straighter. Holden flopped to the grass and sat up with his back wet, and then she and Muskrat zipped out of the frame. She forgot her posture again and leaned forward.

Holden fidgeted on the screen, then rose and sped off. Her scrub was at twenty times faster than base. In under an hour, she could take in the shape of his whole day. Holden at his dinner reading something on a handheld. Holden walking through the same common area her class had been in, pausing to talk to a guard. Holden in the gymnasium, exercising on the old-

style machines that they used to use on ships. Holden sitting at a table on a veranda overlooking the city with Dr. Cortázar and a bottle of wine—

She tapped the feed, dropping back to normal speed, and found an audio track.

“—also jellyfish,” Cortázar said. “*Turritopsis dohrnii* is the classic example, but there are half a dozen more. An adult reverts to a polyp colony form under stress. Like an elderly man turning into a fetus. That’s not the model we’re using, but it means the organism has no set maximum life span.” He took a long sip from his wineglass.

“What model *are* you using?” Holden asked.

“The original inspirations for the work were corpses that the repair drones got hold of. Not really immortality at all, but the new organisms had some improvements. That’s where the breakthrough comes. That’s what we should really be focusing on, sacrifice or no. Healthy subject with a well-recorded baseline instead of this . . .”—his voice rang with contempt—“this *fieldwork*. How to achieve a more robust homeostasis. Just because it’s difficult to do doesn’t make the principal science unsolvable.”

“So not unnatural at all,” Holden said, tipping a little more wine from the bottle into the doctor’s glass.

“Meaningless term,” Cortázar said. “Humans arose inside nature. We’re natural. Everything we do is natural. The whole idea that we are different in category is either sentimental or religious. Irrelevant from a scientific perspective.”

“So if we get to a place that we can all live forever, that’s not unnatural?” Holden sounded genuinely curious.

Cortázar leaned in toward the prisoner, gesturing with his left hand while he swirled his glass in his right. “The only limits on us are what we can do. It’s perfectly natural to seek personal benefit. It’s perfectly natural to give advantages to your own offspring and withhold them from others. It’s perfectly natural to kill your enemies. That’s not even outlier behavior. That’s all in the middle of the bell curve all the time.”

Teresa rested her head in her hands. She was pretty sure Cortázar was drunk. She’d never been herself, but she’d seen some adults at state

functions get the same vague focus and sense of being a little off their own points.

“You’re right, though,” Cortázar said, “You’re exactly right. The foundation needs to be broad. That’s true.”

“Immortality is a high-stakes game,” Holden said, like he was agreeing.

“Yes. Plumbing the depths of the protomolecule and all the artifacts it opens up is the work of a hundred lifetimes. Making the researchers die and be replaced by other people with a less advanced understanding is clearly—*clearly*—a bad idea. But that’s policy. This is the way forward. So this is the way forward.”

“Because Duarte made it policy,” Holden said.

“Because we’re primates who hold valuable things for our own bloodlines at the expense of everyone else,” Cortázar said. “Only one person can ever be immortal. That was what he said. But then he changed the rules. She can be too because he’s found a justification for her. That she’s really just an extension of him. I’m not mad about that. That’s just the organism we are. I’m not mad. But it doesn’t matter.”

“That’s good,” Holden said.

“The important thing is that we get good data. One person. Lots of people. All the same. But bad experimental design? That’s what sin really is,” Cortázar slurred. “That’s not me either. Nature eats babies all the time.”

Holden shifted, looking directly up into the surveillance camera as if he knew exactly where the hidden lens was. As if he knew she would be watching. *You should keep an eye on me.* Teresa felt a crawling sensation coming up her neck and the feeling, even after he looked away, that he saw her as clearly as she saw him.

She shut down the feed, closed the logs, and went back to bed, but she still didn’t sleep.

Chapter Fifteen: Naomi

Getting what you want fucks you up. Naomi pushed the thought aside as she had a dozen times before.

The first part of breaking down her shelter was the easiest. She'd spent years on the float, sometimes running cargo herself, sometimes fighting smugglers for the OPA and the Transport Union. She knew all the tricks. Disassembling her crash couch and system into parts was the work of two hours. Everything she had was modular. Easy to take apart, easy to put into rotation as spare. Everything she'd had could dissolve back into the larger ship and not appear as anything more than a handful of off-by-one inventory miscounts.

The empty container was a little harder, but only a little. According to the manifest, her container was supposed to be filled with the same payload of Earth-farmed bacteria and microbes and starter soil as seventy other containers in the ship. Shifting the contents of just a dozen or so to a slightly less dense configuration left plenty of overage to fill the space that had been hers. By the time the supplies reached their destination, she'd be elsewhere. And even if Laconia backtracked the discrepancies, there wouldn't be much to suggest anything more than run-of-the-mill theft.

The real problem was time. Well, the *first* real problem.

The Laconian ship was already on a braking burn. Eighteen hours to rendezvous didn't leave her much time for everything she had to do. Emma was a help. The woman had more years working transport than Naomi did, and she could drive a loading mech like it was part of her body. Even so, they were cutting it close. And every hour of the mechs hissing and clacking, the smell of industrial lubricant, and the bone-deep ache of effort

was another chance for the regular crew to notice that something strange was happening. Toward the end, Naomi sent Emma away to see whether there was any information about the larger picture. If other ships were being stopped. If this was a coincidence, or if the destroyer knew that Naomi was there.

Until she knew, she had to assume there was hope. Another motto for her life these days.

Naomi moved the last pallets into the steel and ceramic that had been her home for months, closed the doors, sealed them, and slapped a customs inspection sticker over the seam. She still had to stow the loader mech and replace the stickers on all the containers she'd cracked, but that wouldn't take more than another few minutes. She had almost half a shift before the inspection. A little over four hours to reinvent herself and blend in with the ship's crew. That was the second real problem . . .

Getting what you want fucks you up.

They'd been in a bar on Pallas-Tycho not long after the two stations had become a single object. Clarissa had been in relatively good health then. Strong enough she could go drinking, anyway. Naomi didn't remember which bar they'd been in, except that it had gravity, so it had to have been in Tycho's old habitation ring. She did remember that Jim had been there. They'd been talking about how to address Alex's upcoming change in marital status. Whether he'd be bringing his new wife on the ship or taking a leave of absence to be with her or what. Every option had advantages, every one had drawbacks. Looking back, Naomi thought that on some level all of them knew that the relationship was doomed. Clarissa had leaned back in her chair, a glass of whiskey in her hand. Her voice was thoughtful. "Getting what you want fucks you up," she'd said.

"When I was in jail, there was nothing I wanted more than to be anywhere else. Then I got out."

"Into an apocalyptic hellscape," Naomi said.

"But even after that. When we got up to Luna and when we got on the *Roci*. It was hard. I knew what I was when I was in prison. It took me years to figure out who I was outside."

“We’re talking about marriage, aren’t we?”

“Getting what you want fucks you up,” Clarissa had said.

Naomi put her hand on the transport container. She’d put herself in prison in order to be safe, and her safety had turned her captive. All she wanted was to wake up next to Jim again. To have something like a pleasant, day-to-day life with him. And now that she couldn’t have it, all she wanted was her hermitage back.

Her hand terminal chimed. There was only one person it could be.

“Where do we stand?” she asked.

“I’ve got a plan,” Emma said. “Meet me in med bay three.”

“I don’t know where that is. Does the ship have a directory function? Because I don’t really think asking for directions is our best plan.”

“Shit. All right. Wait there. I’ll be down in ten. I can take you there.”

“Copy that,” Naomi said, and dropped the connection. It gave her time to reseal the containers.

Emma, on the float beside her, held the hypodermic needle between her finger and thumb like she was playing darts. Her technique aside, though, the plan was about as solid as Naomi could hope for at short notice. She stretched her chin up and Emma stabbed again, a quick pinch at her jawline at the right to match her already-swelling left.

“How’s that feel?” Emma asked.

“Itches,” Naomi said.

“Still up for the eyes?”

“Yeah.”

Inserting her into the ship’s roster wasn’t possible. Even if they could backdate all the paperwork to the *Bhikaji Cama*’s last port, Emma didn’t have the authorizations she’d need. And messing with the system immediately before an inspection was an invitation to disaster. Fail to shut down one logging system, and the last-minute change was a flashing pointer to whatever you most wanted hidden. So making Naomi into a

regular crewman wasn't possible, but making her not immediately match the biometrics for Naomi Nagata was in reach. All it took was a few well-placed needle sticks and some fluid that caused mild swelling. The only trick was changing the shape of her face in ways that made her look like someone else and not just herself, only puffy.

The med bay was old, but well put together. Nothing had the shine of the new. Everything was worn. But it was only worn, not neglected. Naomi had been around long enough to know the difference. She considered her new face in the hand terminal's camera. Emma's first move had been to shave her hair into an unflattering topiary that made her forehead seem wider and her eyes closer together. The swelling in her brow and jaw had thickened her features already. The system's match to her normal appearance was only 80 percent. Enough that even if they identified her, it could be written off as a false positive.

Unless they already knew she was there.

"I'm putting you in with the crew working the heat sink," Emma said. "Chief has them swapping out coolant exchanges."

"Joy," Naomi said.

"The stink'll give you a reason to be wearing a mask," Emma said. "And it's a mixed-shift crew. Any luck, everyone will think you're from the other one."

Emma drove the needle into the flesh under Naomi's eye. It only hurt a little. "How long do we have?"

Emma checked her terminal and spat out a low, grunting curse.

"We should go," she said, dropping the needle into Naomi's skin one last time. "They're already positioning for transfer."

"If they take me," Naomi said, "I will try to hold out until you can get away. But go quickly, and make sure Saba knows what happened."

Emma didn't meet her eyes, but she nodded. This had always been a risk. It was what they'd signed up for. As Emma gave her a mask and led her down to the engineering decks, Naomi wondered how Bobbie and Alex would find out about it if she was captured. And what Jim would hear. The

temptation was still there. If she did it—if she jumped instead of waiting for the push—she could control the fall.

The coolant lines on the *Bhikaji Cama* were an old design but in decent condition. She'd flushed lines like them back in her water hauler days, and the process wasn't that hard. Punishing and foul, but not hard. There were four others on the team. Five people on a three-shift boat. It wasn't much of a disguise.

The full process would run about four hours if nothing went wrong. She had to hope it was long enough for the Laconians to come, make their inspection and move on. All she would have to do was stay quiet and small until the danger passed. She fell into the work, taking orders from the foreman, doing her part with as little fuss as she could manage. She'd almost forgotten there was anything to worry about more pressing than not getting too much coolant in the air filters, when the interruption came.

"Make safe! Make safe! All you fucking bastards hold the work and make safe, yeah?"

The others all closed down the lines. Naomi did too. There wasn't much choice.

The man who pulled himself past the yellow work barrier was dressed in a chief engineer's uniform. Behind him, three soldiers in Laconian blues, one with a captain's bars. Naomi hooked her foot into a wall handhold. Her heart was going fast, and a hint of nausea plucked at her that had nothing to do with the stink of coolant. The chief engineer motioned for them to take off their masks. The others started to comply. If she hesitated now, it would only call attention where she didn't want it.

Naomi pulled off her mask.

"Was that discussed with senior staff?" the Laconian captain demanded, continuing whatever conversation they'd been having before they came in the room.

"No," the chief engineer said. He was a younger man, but with a rough, scarred face that made him ageless. "Why would it be? Captain says it. We do it. That's how it is. That a problem?"

One of the other Laconians held a hand terminal up to the face of her team foreman. The terminal chimed. Naomi felt a sick kind of peace descend over her.

“It’s an irregularity,” the Laconian captain said. “The political officer will want a full report when you reach the transfer station.”

“Political officer?” the chief engineer asked. Despite herself, Naomi’s ears pricked up. If this was related somehow to the mission in Sol—if Laconia was making a broad crackdown—maybe they weren’t here looking just for her. It was a thin hope, but it was something.

“New oversight regulations,” the Laconian captain said as the hand terminal tracked over Naomi’s face.

“Never heard of them.”

“You’re hearing about them right now,” the captain said.

The soldier frowned. “Sir? This one’s not on the crew list.”

I am Naomi Nagata. I would like to accept the invitation of High Consul Duarte. Please let him know. It was all she had to say. It would even be a relief, knowing that she’d done all that she could first. The chief engineer looked at her and shrugged. “Course she’s not. She’s on the apprentice program.”

The Laconian captain looked at her, uncertain. She kept the confusion off her face. No one on the ship but Emma was supposed to know she was there. *Play along*, she thought. *Just play along.*

“She’s old to be an apprentice,” the captain said.

“Had some trouble back home,” she said. “Trying to make something new.” The lie was easy.

“She needs to be on the crew rolls,” the Laconian captain said, turning away.

“Why?” the chief engineer asked. “She’s not crew. She’s an apprentice.”

“Apprentices are part of the crew,” the captain said, a note of exasperation in his voice.

“First I’ve heard of it,” the chief engineer said. “If I put her in, it starts counting her hours toward a benefits package like she was crew. That’s not how it works.”

“You can take that up with the political officer too,” the Laconian captain said. The last of the work crew was scanned and cleared.

As they left, the chief engineer looked back. His eyes met hers. There was a subterranean joy in them. “As you all were. Shit’s not going to maintain itself.”

“Yes, chief,” Naomi said, and put her mask back on.

They fell back into the familiar rhythms of labor, but Naomi’s mind was working on more than the lines. The others on the team didn’t seem to have noticed anything odd in the conversation. One of them—a thick-faced man called Kip—treated her a little worse, but that was probably just because he thought she was lower status now. Nothing odd about that. When the new exchange was in, the old one sealed, and the diagnostics all in optimal range, Naomi wanted nothing more than a shower and a meal. She didn’t have a cabin of her own, she didn’t know where the gang showers were, and she wouldn’t have a locker there. Even if she got to the right place, after she cleaned up, she’d have to put the same coolant-stinking jumpsuit back on. That seemed worse than not cleaning up in the first place.

She followed the others as they headed back to the crew decks. Lagging behind. She wanted to go to her container. The urge to check her incoming feeds itched as badly as her jawline where the swelling was just starting to go down. But it was gone. Months of habit had just become irrelevant, and she pulled herself along the off-white halls, moving from handhold to handhold with the feeling of having woken from a long dream to find herself in some foreign station where she didn’t belong.

The mess hall had six people in it, but it was built for thirty or more. She pulled herself to a dispenser, but couldn’t get food. It wanted an access code or ID match that she didn’t have. She went to a corner by herself, bracing on a wall-mounted foothold, and waited without knowing what exactly she was waiting for.

Her thoughts moved in the silence of other people’s conversations. When, after an hour or so, Emma appeared, Naomi was almost surprised to see her. The woman pulled a double share of food and brought it over.

“They’ve moved on,” Emma said quietly. “Docked, ran down the whole fucking ship stem to stern, told the captain that he’d need to talk to someone at the transfer station, and gone.”

“Political officer,” Naomi said. “I heard. We got word of one heading for the transfer station in Sol system too. Earth.”

“Well, looks like we have political officers now,” Emma said sourly.

Naomi nodded with one fist. The crackdown was broad, then. A tightening of control over the whole Transport Union. More than that, it might be a sign that Duarte and his machinery were starting to suspect the Transport Union’s role in smuggling the underground from system to system. Or had other plans that wanted loyal and trusted eyes beyond the governors and their staffs.

If they found the shell game, it could mean a serious retooling of their methods at best. At worst, the end of the underground. With Medina in control of the slow zone and their methods of transportation exposed, they were in real danger of becoming thirteen hundred fragmented, isolated movements, unable to support or help each other.

“No one checked you, though?” Emma said.

“Oh, they checked her,” a voice said behind them. The chief engineer floated over and took position beside them. “They caught her.”

Emma blanched. So apparently she hadn’t been behind that.

“I appreciate you covering for me,” Naomi said. “It might be better for you if we just kept it at that. I don’t want to get you in trouble.”

“Are you kidding?” the chief engineer said. “That was the best thing that’s happened to me since I signed up for this haul. Seriously, it was my pleasure.”

“I appreciate your enthusiasm, but—”

He handed her a card. “Override access to a private cabin and a commissary account,” he said. “It’s off the books, so even if there’s an audit, it’ll just come back as unused and overages.”

Naomi looked at it, then at him. Never look a gift horse in the mouth, they said. But it was bad advice. “I’m guessing there’s something you’ll

want in return? Because I think we're going to need to be very, very clear what that is."

"No," the chief engineer said. "Nothing. You've already paid me out. I'm just glad I get the chance to hand some back."

"Excuse me for being rude," Naomi said, "but I've never really trusted the whole kindness-of-strangers bit."

"You're not a stranger," the chief engineer said. "You're the reason I'm an engineer. My dad was a kid on Ceres when the Free Navy stripped it. You and your crew? You put your hands out in peace in the middle of a civil war. You built the Transport Union. As far as I'm concerned, we should kick the captain out of his quarters and give them to you. You more than earned them."

Naomi reached for her hair, trying to pluck it down over her face, but Emma's haircut didn't leave enough for that. "You know who I am, then."

The chief engineer coughed out a laugh. "Of course I do. Anyone in the Belt's going to know Naomi fucking Nagata. It's just these Laconian fucks who can't see what they're looking at. And again, it's a real honor."

"Chuck," Emma said, and her tone made the word a warning.

"I won't say it again," the chief engineer—Chuck—said, lifting a hand. "But don't either one of you worry. I'll get you shuttle access as soon as we're close to port. You're safe with me."

Naomi nodded her thanks, and Chuck beamed. She saw now how young he was. His delight with himself made her heart ache a little. He'd gotten away with something, and his pride was bright enough to read by. She even had a sense of what she must look like through his eyes—a demigod. A figure from myth appearing in his life. A celebrity. God knew she'd seen enough people look at Jim with that expression. This must be what it had been like for him all those times.

It was a feeling she could easily learn to hate.

Chapter Sixteen: Elvi

The ships were old transports that had been hauling people and supplies around Sol system's asteroid belt for a generation before the first gate opened. Elvi watched them being positioned near the surface of the Tecoma ring gate with the *Falcon's* highest-power optical telescopes, and the images were still fuzzy. Both vessels were at most a few dozen meters top to bottom, and they were almost a billion kilometers away. If the *Falcon's* sensor arrays hadn't been orders of magnitude more sensitive than her eyes, they wouldn't have been anything close to visible. But she could make out the mechs and drones crawling over them, making the automated checks and last-minute verifications. Maneuvering thrusters bloomed and vanished as they shifted along the plating and drive cones, checking and double-checking that nothing would go wrong. There was deep irony in that, but if she thought about it too much, she just got angry.

"Hey, sweetie," Fayez said from the doorway. "Can I get you anything?"

"Still no. Just like three minutes ago," she snapped. She grunted, regret jumping into her throat just behind the words. "Sorry. That was shitty."

"No, I see where you're coming from," her husband and intellectual companion of decades said. "I'm hovering. Look."

He let go of the handhold and floated free for a moment, grinning at his own physical pun. She laughed more at the grin than the joke.

"I'm fine," she said. "Really. Perfectly fine."

"Good. That's good. Because some people, when they almost die from being semidrowned in half-alien goo while under a sustained high-g burn, get a little rash. Or zits. Near death can really do terrible things for acne."

“I’m sorry I scared you,” she said. “I didn’t mean to. Really. But I’m fine now.”

Fayez pulled himself into the room, twisting ungracefully to hook his ankles around the wall footholds and absorb the momentum with his knees. He stood on the wall beside her, looking down at the images on her screen.

“I’m sorry,” he said, “that my deep existential panic at the prospect of your death hasn’t faded as quickly as yours.”

“It’s okay. I probably wouldn’t be as calm about it if it had been you. By the time I found out about it, I already wasn’t dead. Doesn’t really have the same punch when you miss all the will-she-or-won’t-she clinging-to-life thing.”

“Yeah,” Fayez said. “I didn’t love that part. I mean, in fairness, I don’t love this part either.”

She put up her hand, and he wrapped his fingers in hers. It was how they always were. Decades of habit shrouded what they meant in humor and wit, but she knew his distress was real. And that her resentment of it wasn’t really about him as much as the raw idiocy playing out near the transit ring. She took a long, deep breath and let it out slowly between her teeth.

“I feel stupid,” she said. “I really thought we were a scientific mission.”

“Aren’t we?”

She pointed one thumb toward the monitor. “That’s not science. ‘Light shit on fire and see what happens’ isn’t science. This is throwing dynamite into a pond to see if any fish float to the top.”

“So . . . natural philosophy?”

“Military bullshit. Solving every problem by trying to blow it up.”

“Yeah,” Fayez said. “Almost makes you wish you could quit, doesn’t it?”

Elvi pushed back from the monitor. In free fall, it was only a gesture that she was disengaging. Fayez’s dark eyes didn’t leave hers. “It wouldn’t be the first thing that made me think that.”

“But.”

“I know. If it wasn’t us,” she said, “it would be someone else. Someone who didn’t know as much as we do. It’s just . . .”

“You think whatever’s on the other side will hit back?”

“Yes. Maybe,” she said. “I don’t know. I don’t like things that can only happen once. You can’t make sense of something when there’s no pattern. One data point is the same as none.”

“Would you feel better if the big man committed to doing this again a few dozen times?”

A couple billion kilometers away, the drive lit up for a moment, flickered, and went out.

“I think he did.”

Elvi wasn’t sure what the atmosphere on the science deck really was. She wanted to think that everyone else was just as uncomfortable with Sagale’s plan and, like her, staying as quiet about it. But the truth was that Jen and Travon looked excited. Their screens showed the inputs from a dozen probes and arrays scattered through the local void and three countdown timers. The first timer showed the time—down to minutes now—when the first ship would pass through the gate and, hopefully, into oblivion. Trailing that by only a few seconds, the timer for the second ship—the bomb ship—that would follow it. And then with three full minutes more, the detonation clock.

They were too far away to disarm the antimatter bomb. Making sure the experiment failed safe if it failed would be up to Medina Station. If the bomb ship somehow actually made the transit into the gate network, Medina would shut it down without detonation. The *Falcon*, almost a light-hour away, was watching literal nothingness for signs that the thing beyond the gates—the thing *inside* them—had even noticed what they’d done.

“You know what would be funny?” Fayez said. “If this whole blowing-things-up plan broke the gate and we were all trapped here on this ship for the rest of our lives with no way home.”

Sagale glowered and cleared his throat.

“You’re right,” Fayez said. “Too soon.”

The first counter fell to zero, turned from blue time-to-transit to red time-since-transit. In an hour they would see it happen, hear the tech ship's report. In the vast emptiness, all they had was the assumption that the plan had actually gone forward.

"Everyone strap in," Sagale said. "If the enemy fires another of those void bullets at the system, we may lose consciousness for a time."

Jen and Travon put on their restraints. Elvi already had hers on. Twice before, she'd lived through the consciousness-breaking backlash of pissing off whatever had murdered the protomolecule. Once on Ilus with an army of alien bug-robots ready to cut her down, once sitting on a couch in a waiting room on Luna watching the newsfeeds as the *Tempest* prepared to annihilate Pallas Station. She was almost used to it at this point, or that was what she told herself. Still, she wasn't looking forward to doing it again. The second timer zeroed. The bomb ship was through the gate. Presumably it had gone dutchman too.

The seconds seemed to go slower as the last timer fell. On the screen two ships waited outside the gate, preparing to begin the first transit. It was like looking into the past, waiting for something to happen that had already happened. The light bouncing off those ships and streaking toward her was almost an hour old, from her frame of reference, anyway.

The last timer hit zero. Somewhere farther away than a mere normal light-hour, something very violent happened in whatever non-space the gates passed through. Elvi held her breath.

"Are we seeing anything?" Sagale asked, his voice tight and tense.

"Nothing yet," Jen said.

Elvi waited for the weird dilation of perception. The sense of being able to see atoms and waves, of experiencing herself and her environment in such detail that the border between them vanished, her body and the universe smearing together like a water-color painting under a faucet. One breath, then another. It kept not happening.

"All right," Sagale said. "Protocol says we will hold position and remain in safety restraints until—"

"Holy shit," Travon said. "Are you guys seeing this?"

On the screens, the space around them boiled. As Elvi watched, confirmation started rolling in from the outlying probes. One after the other, they all reported the same thing. An uptick in quantum particle annihilation. The underlying hum of the vacuum cranking up to a shriek.

“That,” Travon said, his voice low and breathy, “is beautiful. Just look at it.”

“Report,” Sagale said.

“It’s like what we saw in Sol system, sir,” Jen said. “Virtual particle activity has increased massively. I’d have to say they noticed us.”

“Check the time stamp,” Sagale said. “Have we lost consciousness? Did we stay awake the whole time?”

“We did,” Elvi said even before she checked the data. “I mean the second one. We didn’t lose consciousness. We stayed awake.”

“Yeah, our entanglement experiment didn’t break either,” Jen said. “They all failed in Sol system. Ours looks fine. Whatever this is, it’s different.”

Sagale chuckled, and a broad smile grew on his lips. Elvi thought it was the first time she’d seen the man showing anything like real pleasure. “Well now,” he said. “*That* is interesting.”

“God *damn*,” Travon said, “look at this. This is incredible.”

The rates of virtual particle creation and annihilation were swamping the sensors. All the readings pegged at shit-if-I-know-but-more-than-I-can-keep-track-of. Elvi pressed her fingertips to her lips. She’d been braced for the weird dive into broken consciousness. That it hadn’t come was somehow worse.

“Continue monitoring,” Sagale said. “High Consul Duarte will be pleased with this.”

“Why?” Elvi asked.

Sagale looked at her as if she’d made a joke he didn’t quite understand. “The behavior changed. It suggests the enemy can be negotiated with.”

“It doesn’t show change at all. You fired the magnetic field projector in Sol system and whatever this is responded with the bullet on the *Tempest*.

Then you came here and did something completely different, and it responded differently. There's literally no data we can take from that."

"We know now that when we send a punishment ship through, the enemy feels it," Sagale said. "All this? It isn't because a couple of ships vanished. Ships have been vanishing since we started using the gates. This tells us that the tool we've made can hurt them. That's very important. We won't know if it can teach them until we repeat the experiment."

And there it was. *Repeat the experiment.*

"Jen?" Travon said. He hadn't heard anything Sagale said. All his attention was on his screens. "Are you seeing this? There's precipitate."

Sagale's attention turned. "There's what? What are you seeing?"

"The virtual particles aren't all annihilating. It's generating some . . . looks like hydrogen ions? Basically just raw protons."

"Does it pose a threat?"

"No, this is trivial. Even in normal interstellar space, you have an atom or two per cubic centimeter. This is still way below that. If this system hadn't already been weirdly empty, I wouldn't have noticed this at all. I mean, I guess if it goes on for a few decades, it could get to be a problem? Maybe?"

Sagale looked over at Elvi. His plate-flat face was expressionless. It made him seem smug.

"Still," Jen said, "if it's the whole solar bubble, that is a shit-ton of energy. Not rigorously speaking, of course, but just a lot."

"Energy?" Fayez asked.

"Energy. Matter," Jen said. "Same thing. If they're creating actual matter, they're throwing a lot of energy at us to do it."

"Is it evenly distributed?" Fayez asked. Elvi heard something in his voice. A deep rasp that spoke of growing fear.

"Oh," Jen said. And then a breath later, "Oh shit."

"Kind of early to know that," Travon said, clearly behind the curve. "We've only got a couple dozen probes out there. Why?"

"So I know I'm just the geology guy here," Fayez said. "But aren't we a little less than two light-hours away from a neutron star? One that we were

all really impressed at how something had designed it to be right on the edge of collapse? And now something's putting more energy and mass into the system? Because that sounds like it could be a problem."

Elvi's gut tightened.

"Hold on," Jen said, her fingers dancing fast over her controls. The screen flickered as she generated energy curves against time and mass. A few seconds later, she made a little grunt like she'd been punched. "Well, shit."

"Let's not get ahead of ourselves," Sagale said. "Nothing has happened yet. The star looks stable."

"The star was stable two hours ago," Jen said. "But when a rapidly spinning neutron star collapses into a black hole, a gamma ray burst comes out of the poles. A few seconds of it releases as much energy as Sol would in its whole ten billion years. They're very rare."

Travon's face had gone ashy. Elvi felt a shifting sensation deep in her gut, pulling her between fear and awe.

"Commander Lively, are we about to experience one?" Sagale asked, but Jen was elbows deep in calculations before he said it.

"It won't have gone critical," Jen said. "Not yet. Assuming the precipitate generation rate is uniform, which I don't actually know. But we should get out of here as quickly as we can."

"As quickly as we can without killing Elvi," Fayez said. "We almost lost her once. We can't do a max burn."

"All of us dying isn't better," Sagale said. Despite everything, Elvi felt a bleak tug of amusement at how fast the man could change his opinions in the face of evidence.

The admiral pursed his lips. His eyes focused on something internal as he thought. Then, "Commander Lively, please send out your analysis to the tech ship and the team on Medina." He tapped his control board, and his voice echoed through the ship. "All hands make ready. Expect an extended high-g burn."

"We can't just shoot the ring gate, sir," Travon said. "We've got about a billion kilometers to get to the ring, and a million to slow down in on the

other side. Less if we go at an angle, and we still need to miss Medina and the central station so . . .”

“I’m aware of the issues,” Sagale said. “Please make ready. Major Okoye, I’m going to ask that you report to the med bay. My understanding is that we may be able to make this safer for you if we forgo sedation in the submersion couch. It will be unpleasant.”

“That’s okay,” Fayez said. “She’s okay with that. We’ll both go without. I will too.” He turned to her. “I’m sorry, sweetie. I just really need you not to die.”

“I understand, Admiral,” Elvi said. “I’ll go now.”

Sagale nodded once, tightly. Elvi undid the restraints, pushed gently off, floating in the cool air. Fayez had already launched himself down the corridor toward the couches. Elvi grabbed a handhold, stopping herself. She didn’t know if the feeling in her chest was rage or fear or a bitter kind of amusement. Whatever it was felt cold.

“Admiral . . .”

“Yes, Major Okoye?”

I told you so hovered in the air between them. She didn’t have to say it. She could see that he’d heard.

On the screen behind him, the first ship’s drive came to life, moving the ship toward the ring gate. The illusion that it could still stop—that they could undo what had already happened—was as powerful as it was wrong. The bomb ship’s drive cone flared a moment later as it moved to follow.

In a smaller window in the same screen, the neutron star at the heart of the dead system glowed tiny and bright.

Chapter Seventeen: Alex

Hiding a ship in space wasn't all that different from hiding on a school playground. Find something bigger than you, and put it between you and the person looking. Even without something to hide behind it wasn't impossible. Space was vast, and the things that floated through it were mostly cold and dark. If you could find a way not to radiate heat and light, it was possible to get lost in the mix.

Alex ran a map of the Jovian system forward in time, then back again. The moons spun around the gas giant, then reversed and spun back to their starting places. Possible paths shot through the imaginary space like threads of copper, tracing the complex interactions of thrust and temperature and the ever-changing invisible clockwork of interacting gravity. And as he manipulated the variables—what paths became open if they could add another half a degree to the ship, what closed down if they shortened the burn time—the paths blinked in and out of existence. A plan slowly began to form.

Finding an escape route to get the *Storm* off Callisto before the Laconian battleship came in range meant plotting a course off the moon that only included engine burns when the massive bulk of Jupiter was between them and the inner system, and then floating cold and dark when they were in the open. That narrowed the range down. But it was still a little more complicated than that.

Io, Europa, and Ganymede all had observation stations that might be in Laconian control and could pick up their launch and flag it as suspicious. He also needed to plan the launch for a time when Callisto had Jupiter between it, the sun, and the other three Galilean moons. Alex ran the orbital

simulation forward again. A solution existed. There was a window where Callisto was alone on the antisunward side of Jupiter, caught in its shadow long enough to get the *Storm* off the ground. It made for a tight window. Maybe too tight.

They did have a few advantages. The *Storm*'s skin returned an extremely low radar profile compared to other ships. Her internal heat sinks could store days of waste heat. And when necessary, capillary-like microtubules in the ship's skin could be flushed with liquid hydrogen to ensure that the hull's outer temperature remained only a few degrees warmer than space. It was a very stealthy ship when it was flying dark. If the Laconians were looking for a standard rock hopper or salvaged military ship, the *Storm* could look too small to fit the profile. He checked the hydrogen supply, adjusted the temperature variables in his search, and looked again. The window opened a crack wider.

They could take off from Callisto when the moon was behind Jupiter, then do one very hard burn with the planet blocking line of sight to the *Tempest* and any other inner-planet observation posts. It wouldn't keep other ships and minor posts from picking up the drive plume—there were just too many eyes in the system to evade all of them, no matter how complex his flight path. But between running cold and keeping the main observers blocked, he could get a decent delta-v for a few hours. Then they could kill the burn and float dark for as long as the heat sinks held up. Once they'd put a little distance between themselves and the Jovian system, cozied up to the gravitational low-energy paths that the Belters and salvage miners used, they could fade in their fake transponder, start a very gentle burn toward the ring, and hope they looked like just one of dozens of ships headed that way.

Once they were far enough away, put in a call to Saba and see if any of the union ships had room to scoop them up and get them the hell out of Sol system.

It was pretty damn thin, as escape plans went. But they were living in thin times.

Alex ran the simulation back and forth, adding in various launch and escape burn projections until he'd come up with a plan that the computer agreed gave them the best chance of success. If he hadn't overlooked anything. If the variables were weighted correctly. If the gods didn't just hate them that day.

He leaned back, and his skull throbbed like his brain had an appointment elsewhere. He stretched his neck. The muscles felt like he'd been punched. There had been a time he could go for hours fine-tuning a flight plan. And he still could, but the price was higher. He swatted the desk to shut down the holographic map display. The room lights came up on the small and dingy working space he was occupying during their stay on Callisto. A desk that fed directly to the *Storm's* system so that none of his queries would leak out to Callisto's larger data environment. A wall screen with access to a couple thousand different information and entertainment streams. A combination sink, toilet, and shower alcove in the corner that included a rank mildew smell free of charge. It even had a cot with a flat pillow and threadbare blanket if he decided not to head back to his coffin hotel. All the discomforts of a naval base bachelor pad. It didn't make him nostalgic.

He was stirring a chalky analgesic powder into a glass of water, the grains of medicine swirling like stars, when his terminal began playing the first few bars of his favorite Dust Runners song. "Accept connection," he yelled at it, then gulped down his medicine. The bitterness crawled up his tongue like a living thing, and he shuddered. "Yo, Bobbie, what's up?"

"Meet me at the dining room in twenty," she said, then closed the connection before he could ask a question.

Dining room was just a code phrase for a small storage compartment off a seldom-used side tunnel. It was one of half a dozen rooms they'd designated for secret meetings. They were swept every couple of days for listening devices, and members of Bobbie's strike team dressed in civilian clothes kept an eye on them to see if anyone else was going in or out.

Alex's time in the military had all been on board ships or on naval bases waiting for a shipboard assignment. He'd never been a spy or special forces

operator like Bobbie. He found the built-in paranoia that came with a secret mission lifestyle exhausting.

“I should probably pick up some food,” he said to his terminal. It beeped a recognition at him, then sent an order to a noodle shop in the lower medina. The owner of the shop was a resistance member who would send a pickup notification to Caspar. It was another code. He wasn’t even vaguely hungry, but if someone heard him or got a copy of the signal, it sounded innocuous. Nothing about his life was what it looked like anymore.

Ten minutes later Alex walked into the back room of the noodle shop and found Caspar waiting for him. When they weren’t using the space for secret meetings, it was the noodle shop’s dry goods pantry, and boxes of supplies were stacked up against most walls. The station’s heating ducts had been closed off, so the room stayed about ten degrees cooler than the shop itself, and Alex could just see his breath in the air.

“How long do you need?” the kid asked without preamble.

“Dunno. Give me two hours, then we’ll meet up at the casino. Blackjack. I’ll be at the five-dollar table.”

“Copy that,” Caspar said. He pulled off the heavy hooded jacket he was wearing and handed it to Alex. Alex put the jacket on and passed his terminal to Caspar. The kid would wander the station for a couple hours. Anyone who was tracking Alex by terminal location would be sent on a merry chase. It was unlikely that anyone was tracking any of them. The terminals were as stripped down and anonymized as it was possible to make them. If their false identities had been cracked, they would probably already have been picked up by security and interrogated by Laconian operatives. But Bobbie had laid down the operational security law, and they all followed her rules to the letter.

Caspar took the terminal and stuffed it into his jumpsuit pocket, then gave Alex a cheery little wave and headed for the door. “Wait,” Alex said.

“Everything okay?” Something in Alex’s tone had put a little worry line between the younger man’s eyes. *Nothing is okay*, Alex wanted to reply, but didn’t.

“Just be careful. Something happens to you, it doubles my workload.” He tried to make it a joke, but it fell flat. The line between Caspar’s eyes deepened.

“I don’t need you to daddy me, Alex. I know my job.”

“Yeah, sorry about that,” Alex said, then leaned against the wall and rubbed his eyes. His headache made him want to press his face against it. Only a thin layer of composites and insulation separated him from the natural tunnel. Maybe some ice that was as old as the solar system itself would be cool enough to numb the throb in his temples.

“It’s no big deal,” Caspar said. “But my father pulled up stakes when I was seven. I didn’t need one then, and I don’t now.”

“Fair enough. Truth is . . .”

Caspar waited. Alex heaved a sigh.

“Truth is I’m worried shitless about my own kid, and I’m just projecting onto you. Don’t take it as anything else, okay?”

Alex waited for Caspar to leave, but he didn’t. Instead he sat down on a stack of boxes labeled SOY NOODLES and crossed his arms. “You think the Laconians know it was us?”

“What? No, I didn’t mean—”

“Don’t fuck around, Alex. I have family too.”

“It’s not that,” Alex said. He spotted a small bag of dehydrated onion flakes and picked it up. It felt cold in his hand, and heavenly when he pressed it to his temple. Caspar sat on his boxes, staring and bouncing one knee impatiently.

“Then what is it?”

“He’s getting serious,” Alex said. “Maybe even married. Probably married. It’s just making me think about how much I don’t want to mess things up for him. You always think you’re going to leave things better for your kid than you found them for yourself. That’s not working out for me.”

Alex moved his bag of onions to the other side of his head, but it had started to warm up.

“Worrying feels like you’re at least doing something,” Caspar said. “I get it. When I started flying for the union, I worried about my mom so that I

wouldn't feel guilty for leaving her behind."

"You're too smart for your age," Alex said. "But yeah, that's probably it. Or close enough. I was a shit father long before I left my family to play revolutionary."

"I dunno," Caspar said, then stood up. "My father took off because my mother asked him to stop spending the rent money on pixie dust. You'd win father of the year if it was down to a two-man race."

"Thanks," Alex said, and surprised himself by laughing. "That's a hell of a compliment."

Alex's terminal buzzed in Caspar's pocket. The kid pulled it out, then said, "Cap wants to know where the fuck you are."

"On my way."

The dining room was an abandoned storage space about six meters square with spray foam insulation walls and a carbon fiber door that didn't even have a latch. Piping that entered through the walls and then just ended hinted at a past as a machine room, though what infrastructure used to occupy the space was lost to history. A tiny green chalk X had been placed on the lower left-hand corner of the door and was surrounded by other graffiti. The graffiti was mostly gang boasts and assertions of sexual prowess. The green X meant the room had been swept for surveillance less than thirty hours ago and found to be clean. If it had been red, the underground would have left the devices in place and abandoned the room.

Bobbie was waiting for him when he arrived. Impatience in the former Marine eluded most people. She didn't pace. She never bounced a knee or a foot. The only time he'd ever heard her crack her knuckles was before they sparred in the gym. But Alex knew something was up the moment he walked into the room. She was standing perfectly still, but she was stiff, as though she was half flexing every muscle in her body.

"You're late," she said.

“I got caught up talking to Caspar at the drop, and now you’re kind of scaring me.”

“We have the battleship that shrugged off the combined fleets of Earth, Mars, and the Transport Union cruising toward us because we killed a high-ranking Laconian officer. If you weren’t already scared, you’re fucking stupid, and I know you’re not fucking stupid, Alex,” Bobbie said.

“Copy that, Gunny. It’s a fair point,” Alex said, and raised his hands in mock surrender. The dining room was his least favorite place to meet, mostly because there was nothing in it to sit on. Instead he found a patch of wall without any pipes sticking out of it and leaned into the foam of the insulation. “Why don’t you get me up to speed?”

“Sorry,” Bobbie said. She clenched her hands into fists and jammed them into her pockets. “I’m pissed at you right now and it’s not your fault.”

“What can I stop not doin’ so it ain’t not my fault anymore?”

Bobbie chuckled at that and shot him a thin smile. It wasn’t a very funny joke, but he knew she appreciated his not taking her anger personally.

“Something’s been bothering me. You’re right. And Naomi’s right,” she said. “The timer’s running out on our little resistance, and what have we accomplished? We’ve annoyed the empire. Snatched a few ships, some supplies. Killed a few Laconians. And maybe I used to think it was enough to spit in my enemy’s eye while he strangles me. But I’ve been thinking about Jillian’s assessment of the objective value of moral victories, and she wasn’t wrong either.”

Bobbie went silent, like she was listening to the words she’d said. She probably hadn’t spoken these thoughts out loud until just now.

“Are we talking about what I think we’re talking about?”

“I don’t know what you think we’re talking about, Alex.”

“Because,” Alex said, “if we’re talking about packing it in, it’s a lot easier to get off Callisto if we’re not trying to take the *Storm* with us. I mean, I’ve got a plan either way, but—”

“No,” Bobbie said, “we’re not talking about that.”

Anger roughened her voice. He wanted to pull back from her. Retreat, but he’d known her long enough to see it was the wrong way with her.

Whatever she was thinking through, she needed someone to slam it up against. Placating her wasn't going to make either of them happy. Or safe. Even if she did scare him a little, she was still Bobbie Draper, his old friend and compatriot.

But she was also a creature of violence whose frustrations were coming out sideways.

"Copy that, Gunny," Alex said, trying not to sound like a hostage negotiator.

"I'm not giving up," Bobbie said. "I'm figuring out how to *win*. How can we take our present circumstance and find the orthogonal move, the surprise attack that snatches victory from defeat. How do we do more than just *survive*?"

"*Survive* is a pretty good start," Alex said. "I've worked up a launch plan to get the *Storm* off of Callisto, if that helps."

"Yeah, it does. But running away isn't going to solve our larger problem."

"Cap . . . Bobbie," Alex said. "There are three *Magnetar*-class ships in the universe, and the one that kicked the whole combined fleet's ass is steaming toward us right now. Pickin' a fight with her is like me pickin' a fight with you. Not being scared is fucking stupid, to use your own words."

Bobbie didn't answer. She pulled a terminal out of her pocket. It was one of the cheap ones that kiosks in the markets would spit out for a few bucks. Enough battery charge for a few hours, and then you just threw it away and bought another one. She tossed it to him. On the screen was a picture of a small metal ball with text printed on it, and some sort of cable running out of the top.

"The fuck is this?" Alex said.

"The report's linked."

Alex flicked the screen with his index finger, and it changed to an article about the theoretical uses of antimatter for high-energy reactors. Even so, it took him a minute to understand what she meant.

"No," he said.

“Oh yes,” Bobbie replied. “Rini is ninety-nine percent sure. She’s been looking them over and doing the research. We’ve been able to produce trace amounts of antimatter since the dark ages, but it’s never been practical. Now it is. The Laconians know how to produce and store it. I will bet you a week’s wages that it’s coming from the same construction platforms that made the *Storm* and the *Tempest*, and it’s part of the resupply for the battleship. That big cannon of theirs must burn it like crazy when it fires.”

“Laconia’s a hard target, but if you’re right and we could figure a way to knock out those platforms—”

“Yeah, taking out their resupply is great,” Bobbie said. “But that’s just a tactical victory. That’s my kind of target. It’s not yours. Or Naomi’s.”

“My kind of target?”

“If we blew out the Laconian construction platforms, Duarte and his admirals would know why it mattered. But Kit’s friends at university? They’re the ones we need to inspire, for them it has to be something they can see. We have to do something that shows Laconia’s not invincible. That there’s a chance for us to get a new generation on board.”

“You want to drop these on Laconia?” Alex asked, aghast. Sure, they were enemies, but the idea of killing a planet full of people was horrifying. Even in war, there were lines no one should cross.

“If we start carpet-bombing civilians, we’re worse than the enemy.”

Alex felt a rush of relief. He was still fighting for the good guys. “Okay, good. I didn’t think you’d—”

“I want to kill the *Tempest*,” she said. “We show Earth and Mars and everyone in the Belt and every other colony out past the gates that Laconia’s battleship isn’t invincible. Show them that we can win. We’ll create a whole new generation of people willing to fight by lighting the biggest god damn signal fire the human race has ever seen.”

“Bobbie,” Alex said. Something in her eyes was more frightening than her fists had been. A fervor he wasn’t used to seeing there. All the fear and desperation suddenly transformed into something verging on fanaticism. “This is crazy.”

“We’re fucked, and we’ve been playing not to lose. I’m going to start playing to *win*.”

“No, you’re not.”

Bobbie stared at him. Her jaw slid forward a fraction of a centimeter. Every fiber of his body told him to back off, except for the one little part of his brain that knew showing weakness now was a path to disaster.

“You aren’t,” he said. “You’re stung because we had a win in our hands and we lost it. And then Jillian twisted the knife because she was frustrated too, and she’s kind of an asshole. And we found this”—he held up the hand terminal with the antimatter information—“so it feels like the universe handed you a way to redeem the loss. But what you’re really doing is trying to win back what you’ve lost by going all in. It’s shitty poker, and even worse as a battle strategy.”

“Fuck you, Alex. I do this for a living.”

“And you’re really good at it. And you’re smart. And I’m just a glorified bus driver who takes you where you need to be so you can kill people. But you’re wrong about this one, and you know you’re wrong.”

“That’s not what I meant.”

“You want the big symbolic victory,” Alex said. “When has that ever been the smart move?”

For the first time, a shadow of doubt crossed Bobbie’s eyes. She crossed her arms, but she looked away from him. He leaned forward.

“You’re frustrated. And you feel trapped. And hitting back hard is what you do when you feel frustrated and trapped. But let me get us out of here. We’ll get these little balls of hell to Saba. And yeah, maybe he’ll send us back and we can take the *Tempest* down. Or maybe he’ll do something else. But let’s get more voices weighing in on this plan before we go all damn-the-torpedoes. Okay?”

“You think it’s an unwinnable fight. That’s what you just said.”

“I do,” Alex admitted. “But I’ve been divorced twice now. I wouldn’t take my word as gospel. I could be wrong about a lot of things. Yeah, your best soldiers are old shoe leather like you and me. But kids like Caspar are here too. Not as many as I want. Not as many as I think we’re going to

need. But some. I just don't think we should throw them away without a lot of consideration. Let's get out of Sol system. Let the big brains have a crack at the new info, and see what they think is the right strategy."

Bobbie took in a long slow breath and let it out through her teeth. "How long before dust-off? *If* we run?"

"We've got some time."

"All right," she said. "I'll think about it."

"Good," he said, and stood up, ready to give her the room.

"Alex?"

"Yeah, Gunny?"

"Don't take this wrong."

"All right?"

"If you really believe we can't win, you should think about whether you're coming with me if I go."

Chapter Eighteen: Naomi

It wasn't the first time Naomi had found herself the new addition to a crew. Even under the best circumstances, there was an unsettled period. Anyone coming into the webwork of established relationships, enmities, and personal loyalties that was a ship's crew needed time to find or create their own place. A time of isolation in the midst of a crowd.

In that sense, her appearance on the *Bhikaji Cama* was no different from other times. In the sense that she had appeared on the ship halfway through a run without stopping at a station or transferring over from another ship, it was a little weirder. And while they'd kept her identity hidden from Laconia, the small town's worth of crew on the ship was corrosive to secrets. Even as the command staff made a point of not noticing her existence, everyone knew who she was.

Her presence was equal parts embarrassment to the Transport Union, threat to the crew, and the most interesting thing that had happened in the long weeks of transit. Pulling herself down the corridors or getting meals from the commissary, she felt the attention in the way people didn't meet her eyes and the killing effect she had on conversations.

When they reached Auberon, she would need to vanish for a while and hope that her mysterious appearance was put down to rumor and myth. *I was serving on a ship last year, and when the ship was searched, Naomi Nagata just showed up in with the crew. Stayed with us for the rest of the run.* It was implausible enough that it might pass. Or it might be a problem. Either way, she had to touch base with Saba and see what her options were. The advantage of keeping the underground firewalled was that any single accident couldn't bring down everything. The disadvantage was that she

could never know what the big picture looked like. Even as one of Saba's top-tier strategists, she only knew what he asked her to know. And it was possible—likely even—that he chose to be ignorant of some operations himself.

The commissary was wide enough to seat fifty at a time, but she tried to come at off-hours when the three rotating shifts were in the middle of work or sleep cycles. The tables were bolted to the floor, but on the float, no one used them anyway. The food dispensers were old, gray machines that decanted a nutritive slurry in eight different flavors directly into recyclable bulbs. Even the worst rock hopper in the Belt was more pleasant. Someone had painted bright flowers—daisies in yellow and pink and pastel blue—on the walls to make the place seem welcoming. Oddly, the effort halfway worked. Naomi ate the yellow curry flavored gruel with her feet hooked into footholds in the wall. But afterward, there was coffee that was a thousand times better.

Three environment technicians floated in a clump on the far side of the room, talking through a problem with the water purification system. The temptation to insert herself into the conversation was huge, but she held back. Hearing normal human conversation but not being part of it was like a starving woman smelling fresh food but not able to put it on her tongue. She hadn't realized how badly she missed humans until she was among them again. And so when Emma pulled herself into the commissary, it was a relief to see her.

In the days of Naomi's internal exile, she'd learned that Emma's last name had been Pankara before she'd taken Zomorodi as a contract name with four other people. She had siblings on Europa in Sol system and Saraswati, one of the three habitable planets in Tridevi system. She'd been in private security before she joined up with the Transport Union. And she had a hookah designed to function anywhere between five gs and the float. She was also willing to talk to Naomi directly, which made her company more precious than gold. Now she pulled herself to a stop at the machines, took a bulb of something, and launched out to stop herself at Naomi's side and in her orientation.

“All well?” Naomi asked.

Emma shook a flat hand in a gesture that meant *yes and no*. “Captain Burnham won’t talk to me and Chuck won’t stop.”

“I made things hard for you,” Naomi said.

“I made things hard for myself,” Emma said, cracking the seal on her food bulb. “You’re just when it blew up on me.”

“Fair,” Naomi said. It was astounding how good it felt to speak to someone in person and without light delay. Even when the conversation was banal. Maybe especially when it was. “Chuck seems like a decent person. He’s underground?”

Emma chuckled. “He’s not cut out for it. He worries too much. The only reason he’s not sucking down euphorics now is that he figures that no one will say anything to this political officer at the transfer station. Half of the people on the ship have something they’d rather not be looked at too close, and the other half have to work with them.”

“Seems tenuous.”

“Because it is,” Emma said. “But we work with what we have. Besides, that’s what the fight’s all about, isn’t it?”

“How do you figure?” Naomi asked.

Emma took a long, thick pull on the bulb, then shrugged as she swallowed. “The first ship I served on after I ditched Pink-water, the XO had a thing for one of the mechanics. They were both babies. More hormones than blood. The company had a nofraternization policy, but what can you do about it? The XO, she started being where the mechanic was. Started using the ship system to keep track of where people were, on shift and off. Mechanic didn’t love that. Got to where they had a screaming fight in the middle of the med bay. XO started crying. Didn’t come out of her cabin for two days. Good XO otherwise. Mechanic knew his job too. But both of them got fired. Rules, you know.”

“That’s how you see the underground?” Naomi said through a real smile. “Making the union safe for romantic drama?”

“Easy to make rules,” Emma said. “Easy to make systems with a perfect logic and rigor. All you need to do is leave out the mercy, yeah? Then when

you put people into it and they get chewed to nothing, it's the person's fault. Not the rules. Everything we do that's worth shit, we've done with people. Flawed, stupid, lying, rules-breaking people. Laconians making the same mistake as ever. Our rules are good, and they'd work perfectly if it were only a different species."

"You sound like someone I know," Naomi said.

"I'll die for that," Emma said. "I'll die so that people can be fuckups and still find mercy. Not why you're here?"

Naomi considered the other woman. The anger in her jaw and the pain in her voice. She wondered whether Emma had been the XO. It probably didn't matter.

"We're all here for our own reasons," Naomi said. "What they are isn't as important as the fact that we came."

"True," Emma said.

Naomi laughed, and it was a hard, bitter sound. "Anyway, I spent too much time already with people telling me they'd shoot me if I didn't do what they said. That tank's empty for this lifetime."

"May it never refill," Emma said.

A flat-faced man in a command uniform pulled himself into the commissary, glanced at them, and did a fast double take. The environmental techs looked from him to Naomi, then pushed off, shoving their spent bulbs in the recycler as they left. The officer went to the dispenser, pulled a drink of some sort—coffee, tea, maté—and left again without looking back at them. His disapproval made the air feel cooler.

"You've got what you need?" Emma asked, as if the man hadn't been there at all.

The question had more weight than the words deserved. "I'm good," Naomi said. "When we get to port, though—"

"We'll get you out safe," Emma said. "After that . . ."

"I know," Naomi said. After that, she was still a criminal. Still a fugitive. Still a mouse looking for a safe hole. That would come. "Saba may have something for me."

“I’ll light you a candle. Meantime, if you need something, better me than Chuck, maybe,” Emma said, then sucked the last of the paste out of the bulb, smacked her lips, and launched for the door. Naomi floated alone in the commissary for a few minutes more. She felt a little guilty taking a bulb of tea back to her cabin, but only a little.

The *Bhikaji Cama* was a massive ship. Three quarters of a kilometer long and wide enough to look squat in the schematics. It had been built decades earlier to ferry enough people and supplies to one of the outlying worlds that a self-sustaining colony could arrive all at once. Buildings and recyclers and soil and reactors and fuel. Everything that humanity needed to make a toehold in an unfriendly alien ecosphere except a sense of fashion and guidelines on how to woo your mechanics. The halls were a drab green with hand-and footholds that hadn’t been scrubbed in a few too many weeks. The ship conserved water jealously, using passive radiators to shed heat instead of evaporative feeds, and it left the air hotter than she liked.

Her cabin was tiny. Not just smaller than her storage container had been, but smaller than some supply closets she’d had on the *Roci*. The crash couch was cheap, with gel that stank a little, and there wasn’t enough room for her to stretch her arms in it. The design was called *albluepartir* back in the Belt, because if your arm drifted off the edge in your sleep, a sudden deceleration could break it. Some previous tenant had illustrated the anti-spalling cloth with a complex and violent firefight between two sets of stick figures, one with colored-in circles for heads, and the other pale and empty. Naomi strapped herself into the couch, pulled up the system and the false record Chuck had given her, and got back to work.

The ironic thing was that, with the access she had now, she could actually reach more information than with the passive feeds she’d relied on before. She tried to be careful about it, not abuse her access in a way that would raise any more red flags than were already flying. But she had requests out to the union database mirror about political officers and changes to Laconian transfer point regulation. It was the sort of thing that anyone on a ship like the *Cama* might be—and probably was—looking

into. It was only her perspective on the information coming back that made it different.

Thinking that the political officer in Sol system had meant something specifically about Sol was the mistake she'd made. That they'd all made. There was also one on Auberon, and that changed the scope. Now that she knew to look for the pattern, it was there. Freighters diverted to Medina on their transits or held. Environmental audits on ships that were running close to their theoretical maximum load.

It still wasn't confirmation. Nothing so overt as that. But if there had been a massive wave of Laconian bureaucrats being quietly repositioned throughout the colony worlds—a new level of infrastructure being put in place without fanfare or warning—this was what it would look like. One political officer going to Earth was an opportunity. Two political officers being set in place in Sol and Auberon were a threat. A new Laconian mandarinat covertly set to keep eyes on the transfer points was an escalation. If Laconia continued the trend and put officers on the ships themselves, it was the end of the shell game.

She flicked through the data, looking for places where she might have been wrong. Where her interpretations could have been mistaken or where another interpretation could have fit the same data. She was reaching for hope the way a patient might by holding a doctor's hand and saying, *But it might not be terminal, right?*

Emma accepted her connection almost as soon as she requested it.

"I need to send a message," Naomi said.

"Where to?" Emma asked over the gabble of other voices.

"Upstairs," Naomi said. "Do you want me to say the name?" Emma was silent for a moment. Then, "Can you find your way to ops?"

"I'll meet you there," Naomi said, and dropped the call.

She moved through the ship faster when her mind was on something else. As if her body, freed from thinking about her place in the rhythms of the ship, found them automatically. She composed the message as the decks passed by her, what she could say to make the situation clear to Saba but

obscure to anyone intercepting the tightbeam either here or at the repeaters that bridged the interference through the gates.

She heard Emma's voice before she reached the ops deck. Her tone was high and rough as a decking saw. Naomi pulled herself onto the deck and grabbed a handhold to stop. Emma was on the float by the comms station, her arms folded and her jaw jutting out. A man with a salt-and-pepper beard longer than his close-cropped hair looked away from her long enough to recognize Naomi, then back at Emma in disgust. His uniform identified him as Captain Burnham. The comms tech was between them like a mouse at a catfight.

"The answer was no before," Burnham said, then pointed toward Naomi with his chin. "Now that *this* one is on my deck, the answer's go fuck yourself."

"It's nothing," Emma said. "Five-minute tightbeam to Medina? No one would even blink at it. It's trivial."

"It's already too much." He turned to look at Naomi. "Don't say anything, you. I know who you are, and I know what you are, and I have extended my unrequested hospitality to you out of grandmotherly fucking kindness."

"You have as much to hide as she does," Emma said. "Everyone knows about the sealed cabins."

The comms tech pulled himself down into the gel of his crash couch like he could disappear into it. Naomi considered the captain of the *Bhikaji Cama* with all the calm and dignity she could manage. "I appreciate that my presence puts you and yours at greater risk. I wouldn't have chosen this if there were a better way, but there isn't. If things had gone the way I hoped, you'd never have known I was here. That's not the way it happened, though. And now I need five minutes with your tightbeam."

Burnham lifted his hands to her, palms out. *Stop*. "Ma'am, I am not a partisan, but I know a lot of my crew are. I'm the kind of man that kens when to shut up and mind my own business. I'm not turning you over to the political officer, but don't mistake that for loyalty. I'm trying to get my ass out of a crack, and I'm getting more and more convinced that locking you

in a cabin and welding the door shut might be an easier path than the one I've chosen."

"It's important," Naomi said.

"It's my ship. The answer is no." His eyes were hard, but it was as much fear as anger. Naomi waited a moment, seeing what her gut said. Push or back down. Emma sighed, and the captain's beard shifted as his jaw went tighter.

"I understand," Naomi said. She met Emma's eyes for a fraction of a second, and then they moved to the bulkhead together. Emma fumed silently until they made the turn into the lift shaft.

"Sorry about that," Emma said. "He's an asshole."

"I did stow away on his ship and put him at risk of a Laconian interrogation room," Naomi said. "Expecting him to take orders from me along with it might be too much to ask. I'll find another way."

"I can help unbox some of those communication torpedoes," Emma said. Her tone made it an apology.

"I'd rather find another way to use the tightbeam. Time may be important. But Emma, you have to be more careful."

"He's not going to fold," Emma said. "I've shipped with that man long enough to tell when he's at his edge. There's a thing he does with his lips. I can clean him out playing poker too."

"That's not what I mean," Naomi said. "You said five minutes talking to Medina."

"They were going to know where the message was going anyway," Emma said. "They had to."

"I didn't know Saba was on Medina Station, and I do now," Naomi said. "Now if they catch me, it compromises him."

Emma pressed her lips tight. "Sorry. I assumed that . . . Sorry."

"We'll tell him. I'm sure he has plans to shift locations if he needs to."

Emma nodded, then muttered *fuck* under her breath. Even as she thought about other ways to get comm access, Naomi spared a moment to feel sympathy for her.

Emma's hand terminal sounded at the same moment that hers did. Another chime sounded from down a corridor. A ship-wide alert. Or something bigger. Naomi thumbed the notification open.

ALL UNION SHIPS: TOP PRIORITY. ALL TRAFFIC THROUGH ALL GATES IS SUSPENDED BY ORDER OF LACONIAN MILITARY COMMAND. NO SHIPS PERMITTED THROUGH ANY GATE UNTIL FURTHER NOTICE. ALL TRANSITS ARE ON HOLD. ALL SHIPS ON APPROACH ARE TO EVACUATE THE LANE TO .8 AU IMMEDIATELY.

Emma was moving through data fast, flipping from one interface to another, and so intent on her hand terminal that she didn't notice she was drifting. Naomi caught her elbow and pulled her to the wall.

"What happened?" Naomi asked.

"Don't know," Emma said, shaking her head. "Something big."

Chapter Nineteen: Elvi

The hard burn out of Tecoma system without sedation was a slice of hell. The crash couch felt close as a coffin around her. The breathable support fluid was thick in her throat. She tried to tell herself that it was like being in a dream where she could never drown, but every few minutes, she felt an animal panic in the back of her head. Throughout most of human evolutionary history, the watery inside-a-pipe-with-no-way-out view she had would have been the last thing someone saw before they died in pain. It was hard to convince her hindbrain that this time was different.

The monitor, weirdly, was crisper and easier to see than normal. Something about how the fluid did or didn't scatter light. Or evidence that she needed to look into vision correction, she didn't know which. But she could track the ship's progress on its mad dash for the ring and the data still streaming in from the probes. The fizz of miraculous protons kept coming into the system, and the spin of the Tecoma star and the magnetic fields it generated were pulling some of the new matter into a glowing accretion disk. It was almost beautiful except for the part where it could collapse into a black hole and generate the gamma ray burst that killed them as fast as a neuron could fire.

With the adjustable buoyancy in the tank, she felt the burn less as being pressed down and more as being squeezed in a massive and invisible fist. Red flight information data kept her aware of how tenuous her position was. Surviving a sustained thirty-g burn in a conventional crash couch would have been about as likely as living through a free fall drop from orbit onto a pile of knives.

When they hit the midpoint of the flight, the *Falcon* kicked off its drive, flipped the ship, and started its deceleration in less than a minute. All Elvi experienced was a moment's vertigo and a bloom of black spots in her vision that cleared away again quickly. The animal panic rose in her again, and she fought to keep it back.

I AM NOT LOVING THIS EXPERIENCE, she sent to Fayeze. She hated that she couldn't say it or hear his voice.

A moment later, a message came back. I KNOW. I CAN'T DECIDE IF I'M PANICKED OR BORED. V. CONFUSING. BEEN READING THE SAFETY GUIDELINES. TURNS OUT MALES ARE SPECIFICALLY DISCOURAGED FROM MASTURBATING IN THE GEL WHILE UNDER BURN. WONDER WHAT THAT TEST PROTOCOL LOOKED LIKE.

The fluid made it hard to laugh. Her husband might not have been a good match for anyone but her. But for her, he was perfect.

Hours later, they passed through the ring gate into what everyone still called the slow zone. The *Falcon* jounced as maneuvering thrusters took them off the mathematical line defined by the gate and the star. Under perfect circumstances, the couch would have cycled through three sets of progressively thinner fluid before it finally drained, but Elvi was done. She selected IMMEDIATE RELEASE from the system menu, approved the override, and heard the deep chunk-chunk-chunk of the pump as it drew the fluid away and injected oxygen-rich air in its place. She might choke and cough and feel like she was getting over bronchitis for a few hours, but she genuinely didn't care.

Admiral Sagale hadn't either, because the first thing she heard when her crash couch popped its seals and slid open was his phlegmy voice.

“—for immediate evacuation. We have data that the high consul specifically mandated.”

Elvi pulled herself up. Her muscles ached like someone had beaten her with a hammer. She floated to the bridge. Stopping herself on a handhold felt like it was going to bend the joints in her hand the wrong way. Sagale's couch was in its open configuration, but a film of fluid still clung to his hair

and arm. The smell of it was too complex for her mind. Her brain kept reaching for comparisons and then abandoning them—grape jelly, cinnamon, acetate, nutmeg—over and over. Behind her, Fayez groaned. Sagale looked over at them, scowling.

“You shouldn’t be out of your couch, Major Okoye,” he said, and before she could respond, the comm channel did.

“Your request is noted,” a familiar voice said. Elvi knew she should recognize it. The sustained high gs might have compromised her more than she’d thought. “I’ll do what I can.”

“Governor Song,” Sagale said. “The *Falcon* is on a scientific mission critical to the empire. If we busted our asses to get here so we can die waiting in line—”

The penny dropped for Elvi. Jae-Eun Song. Governor of Medina Station. She’d heard of the woman often, though they had never met.

“Admiral Sagale,” the woman said. It was strange to be close enough to another ship that the light delay made interrupting him possible. “I had no warning about this. I had sixty-four ships in the zone, including Medina Station and the *Typhoon*. I’ve gotten it down to twenty-eight, even with you screaming through my gate and screwing up my queue. You can give my team a minute to run the numbers.”

Sagale’s expression landed somewhere between annoyance and rage, but his voice was professional. “Understood, Governor. Didn’t mean to step on your toes.” He turned off his microphone with a gesture like a punch.

“What’s—” Elvi said, then braced herself and coughed up a thick wad of breathable fluid. Fayez appeared at her side with a towel. She spat into it. “What’s going on?”

Sagale put a volumetric display on the main monitor. The alien station hung exactly in the center of 1,373 gates evenly distributed around the surface of a sphere that had nothing outside it. Icons marked the repurposed generation ship that was the oldest station in the space between worlds and the *Magnetar*-class Laconian warship that was the newest. Along with them, a scattering of ships in a space barely smaller than the Earth’s sun. If

the icons had been to scale, they'd have been less than motes of dust. Fewer than a hundred bubbles of air in a space the volume of a million Earths.

"Governor Song is trying to evacuate the ring space per my recommendation," Sagale said. "She is also trying to move Medina Station further out of harm's way in case a gamma burst does come through Tecoma gate. But preparing the station is proving difficult, as it means stopping the spin drum and turning on drives that haven't been used in several decades. In that context, I have asked for a priority transit to Laconia."

"And?" Fayeze asked.

"And her team is crunching the numbers," Sagale said, biting each word off individually. He was scared. He was right to be. She was too.

"Where's Jen?" she asked. There was a sharp pain in her chest. More fluid coming loose.

"The others are sedated," Sagale said. "There was no reason to keep them awake."

"She could have monitored the data coming in from Tecoma," Fayeze said. "I mean, I can look at it, but Jen's the one that understands."

"I'd rather focus on keeping her alive so she can make sense of it later," Sagale said.

"It's going to hit the station, isn't it?" Elvi said. "The star, the gate, and that alien station that runs the ring space. They're all in a line."

"Yes," Sagale said.

Fayeze raised a hand over his head like a kid in a classroom. "Um. Point of clarification? Do we really want to make a transit right before that happens? Because if I recall correctly, the whole reason that we have a *Magnetar*-class ship here at all is because hitting that little ball there with a massive energy burst makes an exponentially larger plume of gamma radiation pop out of all the gates."

"We have been able to use that effect to guard all the gates simultaneously, yes," Sagale said. "The cannons-on-the-cliffs strategy."

"And don't we want to be on this side of those cannons when they go off?" Fayeze was talking too fast. Elvi took his hand, squeezing his fingers,

hoping it would calm him. “I’m just asking, because the thing where we rush through to safety just in time to get cooked by the aftermath seems unpleasant.”

“It’s a calculated risk,” Sagale said. “We aren’t certain that the station will survive the blast. Or what will happen if it doesn’t.”

She watched new vistas of catastrophe unfold in her husband’s eyes. The station might break. The slow zone might collapse. It had been unthinkable right up to the moment he thought it.

“Okay, yeah,” Fayez said. “That’s a fair point.”

Governor Song’s voice came over the comm channel. “Admiral Sagale?”

“Yes?” Sagale said, then remembered he’d turned off the mic. He enabled it again. “Yes, Governor. I’m here.”

“We have slotted the *Falcon* for priority transit through Laconia gate. I am sending you the traffic control data now. Do not rush your transit. We’re cutting it as close to the limit as we can here. I don’t want anyone going dutchman.”

Sagale’s head came back a degree, as if the thought had surprised him. His voice when he spoke was clear. “Understood. Thank you for this, Jae-Eun.”

“If we live through this, you owe me a drink,” the governor of Medina Station said. “The ship ahead of you is the *Plain of Jordan* through Castila gate. Please monitor that and match to your plan. Godspeed, Mehmet.”

Sagale turned his attention to the controls, and a moment later the gravity warning sounded. Not that anyone else on the ship would hear it. Elvi had to fight the urge to shout the emergency evacuation command and let all the other ships figure out how to be safe about it.

“How long do we have?” Elvi asked, and then laughed. It sounded like she was asking how long they had to live, and since she kind of was, it seemed funny. Sagale didn’t join in.

“We’re going to be at a quarter g for a while if you want to stretch your legs,” he said. “Then you have to be back in the couch. Once we make the

transit, I'm making a hard turn and burning perpendicular to the ring to get us away from it."

"In case of overspill," Fayez said.

"From an abundance of caution," Sagale said. He passed the back of his hand over his eyes, and Elvi realized that for all his stoic reserve, he was weeping. The drive kicked on, and she drifted to the deck. Fayez put a hand on her shoulder and drew her away.

"This is bad," he said softly.

"I know."

He nodded. "I just felt like I needed to say it out loud."

She took his hand and kissed it. It still smelled like breathable fluid. "If this is all we get . . . Well, then shit."

"With you on that one, sweetheart," he said, and folded his arms around her. "This whole thing really was a terrible idea, wasn't it?"

"Couldn't have seen it coming," she said. "I mean, unless . . ."

Something moved in the back of her head. Something about the *Magnetar*-class ships and the way the *Heart of the Tempest* had annihilated the rail guns on the alien station during Laconia's first incursion. The way it had killed Pallas Station. The way the enemy had reacted differently.

"You're thinking something," Fayez said. "I can hear the gears turning."

"I don't know what yet," she said. "But yeah. I am."

A new voice came from the bridge. The comm channel still open on Sagale's controls. *This is Plain of Jordan confirming transit in two minutes. We are go, no-go in ten seconds.*

Another voice answered. *Medina control here. You are go for transit.* Sagale was muttering something under his breath. It might have been profanity. It might have been prayer. The volumetric display showed a single red dot in the vastness moving toward the pinpoint white of a gate.

"We better get back in our cans," Fayez said.

"Yes," Elvi said, but she didn't move. Not yet. "It was designed, right? Tecoma system was designed. To . . . to do this?"

Fayez smoothed a hand across her head. The fluid was dry enough now to be tacky, but the touch felt good anyway. "Elvi, you are the light of my

heart. The woman I love and know better than I know anyone, and I can't get through the day without being dead wrong about what you're going to say or want. The protomolecule engineers were some kind of quantum-entangled high-energy physics hive mind thing. I don't know what they were thinking."

"No," Elvi said, shuffling back toward her couch in the gentle quarter g. "It was designed. There was an *intention*."

"Does that help us?" he asked. "Because that would be great, but I don't know that I see how that helps us."

This is the Plain of Jordan transferring our status now. We are on approach to—

The display stuttered and threw up an error readout. The lights went out and the gravity dropped away.

"Brace!" Sagale called out from the blackness.

Elvi reached out in the blackness, trying to find a wall and a handhold. "What happened?"

An emergency light stuttered on. "Sensor arrays overloaded," Sagale said. His voice was shaking. "They're resetting now. I have to get us stopped until we can . . ."

He didn't finish the thought. The handhold buzzed gently with the vibration of maneuvering thrusters, and the *Falcon* swung up around her, lifting her feet off the deck. Fayez helped her reorient as the gravity alert sounded again and up and down returned. The volumetric display came back up with a warning at the edge that said NO INPUT—ESTIMATED POSITIONS ONLY. Sagale gunned the drive for a few seconds, and the *Falcon* felt like an elevator lurching toward some upper floor. Then he killed it and Elvi drifted up again.

The three of them were silent for a long moment while the backup sensor arrays lurched to life. The comms clicked once, rattled with strange, fluting static, and filled with the gabble of panicked human voices. Sagale killed the channel and opened a private one.

"Medina Station, this is Admiral Sagale of the *Falcon*. Please report status."

Elvi pulled herself to Travon's station. She didn't know if it took the ship a fraction of a second longer than usual to recognize her and put her data on the monitor, or if it was just the adrenaline throwing her perceptions off. The main sensor arrays were dead. Burned out in a fraction of a second. Backup systems slowly hauled themselves to life. Cameras and telescopes all around the *Falcon* unpacked themselves from hardened compartments and deployed. More of them were damaged than she'd expected. But not all. She opened a window and fed the data from the *Falcon's* skin to her screen, and in the darkness, there was light.

"This is Governor Song, *Falcon*," the woman's voice came, trembling like a violin. "We have sustained some damage to the ship and crew. We are still assessing."

The space between the rings was filled with whiteness. The station at the center—the alien control station that seemed to carry the rings with it like the center of a dandelion surrounded by seeds—was brighter than a sun. And some nebula-thin gas or dust cloud caught that light and shimmered. It was everywhere. It was beautiful. It was terrifying.

"It's going to be all right, Governor," Sagale said in a tone that almost made it plausible. "I need to know the status of the *Plain of Jordan*. Did it make transit?"

"Mehmet, I don't—"

"It's important. Did the ship make it through?"

Since the first time she'd seen it—the first time anyone had seen it—the boundary of the ring space had been a dark and featureless sphere, like a black bubble seen from inside. Now there was a twisting rainbow of energy or matter on it, like an oil slick on water. The darkness of it had always let Elvi imagine it to be infinite before. A vast and starless sky. Now it felt close and finite. It made everything seem more fragile. A wave of nausea passed across the edge of her awareness like it belonged to some other body.

"No," Governor Song said. "They were too close to the gate to shift back when the blast came. The energy through Tecoma gate would have . . . They didn't make the transit."

“Please confirm, Medina. You’re saying the *Plain of Jordan* went dutchman.”

“Yes. We lost them.”

“Thank you, Medina. Please advise traffic control that all transits are suspended until further orders. No one comes into this space, and no one goes out. Not until I say so.”

To her left, Fayez was at Jen’s station, seeing—she assumed—all the same things. Feeling some version of the awe and terror and wonder that she felt.

“Understood,” Governor Song said. “I’ll see to it.”

“Thank you, Jae-Eun,” Sagale said. “We have some work to do. We’ll need reports from the other systems. I’m guessing that there’s been some damage from the far sides of the gates too. It may take some time to—”

“Gates moved,” Fayez said in the same tone he used for trivial information. Laundry’s dry. Dinner’s ready. Gates moved.

“What?” Sagale said.

“Yeah,” Fayez said. “Not much, but a little. And all of them. Look for yourself.”

Sagale shifted the main screen. The slow zone bloomed. And with it corrections on each of the gates. The ships were all in place, all matching their expected vectors and positions. But a little yellow error code hung at the gates to show where they were expected to be, and where they were instead. Sagale’s face was ashen. Elvi felt herself wondering how many more shocks the man could take. Or, for that matter, many how many she could.

“Yeah, so,” Fayez said. “Pretty sure I see what’s going on. They just reordered. Because there’s not as many of them now. Equal distance between them got a little bigger. Tecoma gate’s gone. And . . . Oh yeah. Look at that. Thanjavur gate was pretty much straight across from it. And it’s gone too. We just lost two gates, Admiral. And one of them had an entire world filled with people behind it.”

Chapter Twenty: Teresa

The science exposition was held in one of the public halls and on the grounds outside it. The vaulted ceiling gave the hall a sense of something that had been grown more than built, and the acoustic controls kept what could have been an overwhelming din of voices and noise calm and reassuring. A thousand children from five years old to sixteen ran and talked and made groups, associating for the most part with people they already knew and who attended the same schools they'd come from.

The open schools all had their own stations in the hall, each one showing what the students had been studying in the last year and how it would add to the overall work of the empire. Some, like the water cycle demonstration, were basic, meant for the youngest children. Others, like the forest of life that compared the different ecosystems of the new worlds, and the programmable matter station that showcased the most recent materials science from Bara Gaon, were sophisticated enough to be interesting for her.

And Connor was there.

As the days passed, she found the sting of remembering Connor and Muriel being involved with each other grew a little less raw for her. Not painless. The image of them kissing—which she had very clearly in her mind for something she'd never actually seen—still bothered her. So when Connor nodded to her when she walked by and tried a little smile, she didn't know what to make of it. Did he still like her? Was he trying to tell her that his connection with Muriel had been a mistake, or that he was glad that he and Teresa were still friends? She wasn't sure which option she was hoping for. Or if she was hoping for any of them. Connor was confusing.

Muriel and the others from her school had a booth about soil science and how to design microbes that could pass nutrients between organisms from different biomes, and Teresa was technically supposed to be with them. She didn't want to be there. And really, she could go wherever she wanted. It wasn't like someone was going to tell her she couldn't.

Instead, she went to the puzzle station where younger children worked with blocks trying to re-create shapes or argued over how to fit circles into a square or build a complex structure with only gravity and friction to hold it together. She'd done all the puzzles a thousand times over when she was younger. She moved through, giving encouragement and hints to the frustrated, and wondered if Connor would follow her there.

A young girl—maybe six years old—sat at one of the tables by herself, scowling. Teresa sat across from her because she could see the place where Connor would be from there.

The girl looked up at Teresa and seemed to gather herself. When she spoke, it was with the stilted formality of someone who had been coached in what to say and how to say it.

"Hello. My name is Elsa Singh. I'm pleased to meet you."

"I'm Teresa Duarte," Teresa said.

"Are you a teacher?" Elsa asked.

"No, I live here."

"No one will play with me," Elsa said, scowling at her.

"I could teach you something, if you want."

"All right," Elsa said, and seemed to settle deeper into her little wooden chair. Teresa glanced over toward the school display. Muriel and Connor were talking, but Muriel was doing most of it, her lips moving fast like she was fighting to keep his attention. To her surprise, she felt a little pang of sympathy for the girl. If Connor had convinced Muriel to alienate Teresa Duarte, daughter of the high consul and maybe someday ruler of the Laconian Empire, and then gone cold on her? That would be a shitty thing to do. Effective too, because the pang passed as quickly as it had come. Muriel could deal with her mistakes on her own.

“All right, Elsa,” she said, refocusing. She pulled up her handheld. “This is called the prisoner’s dilemma. Look at this . . .”

Teresa built a table like the one Ilich had built with her, explained the rules—each player would decide to cooperate or defect, and they’d each be better off if they defected, but it would be better in the long term to cooperate. Elsa seemed only mildly interested, but willing to follow along.

Connor started moving away from his group just as a new bunch of presenters arrived, washing through the hall with delight and gabbling. He seemed to disappear behind the flood, but she caught a glimpse of his brown hair. She thought he was coming toward her. Her heart started beating a little faster. She wasn’t sure she was more worried that he would find her or that he wouldn’t.

She played the game with the little girl, pretending to care about it more deeply than the stream of humanity over Elsa’s shoulder. They both cooperated for a few rounds, and then, when Teresa felt like it was time for the rest of the tit-for-tat lesson, she defected. Elsa looked at the handheld with the results as if it didn’t make sense.

“Now,” Teresa said. “The thing is, once someone defects like that, you have to decide what—”

“You cheated!” The little girl’s voice was more than just loud. It was a shriek of rage. Her face was twisted in a vicious scowl and dark with blood just under the skin. “You said we should be *nice*!”

“No,” Teresa said. “It’s part of the lesson . . .”

“Fuck your *fucking* lesson,” Elsa said. Out of a child that young, the profanity was like a slap. Elsa grabbed the handheld and threw it into the crowd, standing up so fast her chair toppled, clattering on the ground. Before Teresa could do anything, Elsa collapsed and started weeping on the floor.

Security personnel were already moving through the crowd toward them, but Teresa waved them off. She felt trapped between wanting to comfort Elsa or get her handheld back or leave in humiliation and shame. Elsa’s mouth was square and gaping as her sobs turned into screams again. Someone nearby shouted, *Monster!* and Teresa thought for a second they

meant her. Then the woman was there. Older, with eyes the same shape as Elsa's, the same skin tone. Elsa's mother scooped the girl up in her arms, rocking her.

"It's okay, Monster," the mother said, and hushed her gently. "It's all right. Mama's here. I'm right here. It's okay."

Elsa clamped her hands over her ears, closed her eyes, and buried her head in her mother's embrace. The mother rocked her, gently making cooing sounds to soothe her. Teresa took a step forward.

"I'm so sorry," the mother said. "Elsa gets overstimulated. It won't happen again."

"No," Teresa said. "It was my fault. She's fine. It was me. I didn't explain the game well enough."

The mother smiled and turned her attention back to Elsa. Teresa waited for the mother to start asking questions of the little girl. *What just happened?* and *What mistake did you make?* and *What would you do differently next time?* All the things her father would have asked her to make the moment meaningful. But Elsa's mother did none of that. She only calmed her daughter and told her that everything would be all right. That she was loved. Teresa watched with a sensation she couldn't quite recognize.

She didn't notice Colonel Ilich coming up to her until he touched her shoulder.

"I'm sorry to interrupt," he said. "Your father is asking to see you. Now, if you can."

"Of course," she said, and followed, only pausing to retrieve her handheld.

Her father's private office was small. A small desk with a monitor built into the surface that could display flat on the surface or volumetrically over it. As she came in, it was showing a schematic of the slow zone—the gates, the alien station at their center, Medina Station, and a few dozen ships scattered through 750 trillion cubic kilometers. A space smaller than the interior of a star. Her father was still as stone, looking at it. It was like he didn't need to breathe anymore. "Is everything okay?" she asked.

“What do you remember about the experiment in Tecoma system?”

Teresa sat on the little couch, folding her legs up under her. She tried to recall everything she could of the science briefings she’d been in, but all she could think of was the crying little girl and her mother.

“It’s where we were doing the first tit-for-tat experiment,” she finally said. “To see if the enemy can be negotiated with.” It seemed ominous that she’d just been reviewing the prisoner’s dilemma, and that it had gone badly.

“To see if we can make it change its behavior, yes,” her father said, then gave a small, rueful chuckle. “There’s good news and bad there.” He gestured at his monitor, throwing a report to her handheld. “Look this over. Tell me what you make of it.”

Teresa opened the report like it was a test from Colonel Ilich. Her father watched her while she read through it, looked at the datasets, tried to make it all make sense. She tried not to read Admiral Sagale’s summary at the end, because that felt like cheating. She should be able to draw the conclusions herself.

Then she reached a part of the report that she had to read three times to be sure she’d understood. She felt the blood draining from her face.

“It collapsed into . . . it collapsed into a black hole? They collapsed the neutron star into a *black hole*?”

“We believe so,” her father said. “It was precariously balanced, and apparently maintained at that balance point in a way we don’t understand. When more mass was added to the star, it was enough to push it over.” He put a hand over the report and looked into her eyes. “Dr. Okoye and her team saw that there was a danger from that. Do you know what it was?”

“The gamma burst,” Teresa said. “It’s the most energetic event that there is. We’ve seen gamma bursts from other *galaxies*.”

“That’s correct,” he said, but she couldn’t get her mind around it. “And what do you remember about Tecoma system?”

She drew a blank. She should have known. Should have remembered.

“The star’s rotation put the poles in line with the gate,” he said, gently. “No other system we’ve ever seen has been like that.”

“What happened?” Teresa asked. He took his hand away, letting her read the rest of the report. “We lost two gates?”

“We did,” her father said as if it were a normal thing. “And we saw plumes of gamma radiation coming out on the solar system side of every other ring gate, much the way they did when the *Tempest* hit the alien station in the ring hub with its magnetic field generator. And . . .”

It was like hearing that sometimes you woke up in the morning and didn’t have a color anymore. That red could die. Or that three could be shot off the number line. Learning that a gate could be destroyed was like learning that a rule of her universe so basic that she’d never even thought of it as a rule had been violated. If he’d said *You actually have two bodies* or *Sometimes you can walk through walls* or *You can also breathe rock*, it wouldn’t have felt stranger. More displacing.

He raised his eyebrows. What else? She looked at the report. She felt like she was shaking, but her hands looked steady. It only took her a few seconds.

“And the *Plain of Jordan* failed its transit,” she said. “We lost a ship.”

“Yes,” he said. “That, it turns out, is the critical issue. Here is the decision we have to make. What do we do about it?”

Teresa shook her head, not disagreeing but reaching for some kind of clarity. The scale of the damage was overwhelming. Her father leaned back in his chair, steepling his fingers.

“This is a policy decision. And policy decisions are difficult,” he said, “because there may not be a right answer. Put yourself in my place. Think about the larger picture. Not just now, not just here, but everywhere that humanity is going to spread. And forever. What is the wise course of action for me now?”

“I don’t know,” she said, and her voice sounded small, even to her.

He nodded. “That’s fair. Let me narrow the options. The rules of game theory are that when a ship fails to transit, we punish our opponents. That’s the basis of the policy I put in place. So in light of what happened, do we follow that now, or do we stop?”

“We stop,” Teresa said without hesitation. She saw the disappointment in her father’s eyes, but she didn’t understand it. It was the obvious answer. He took a deep breath and tapped his fingers against his lips for a moment before he said anything.

“Let me give you some context. There was an incident when you were young,” he said. “This was when your mother was still with us, so you were very young. Barely able to speak. You had a favorite toy. A carved wooden horse.”

“I don’t remember it.”

“That’s all right. There was a day when you needed to nap. You were very, very tired and very cranky. Your mother was trying to feed you, the way she did before you slept, but you were chewing on your horse. Your mouth was full. So your mother took the horse away, and you threw a tantrum. In that case, we had two options. We could keep the toy away from you so that you could do what needed to be done. Or we could hand it back, and teach you that throwing tantrums worked.”

The image of Elsa in her mother’s arms came to her like it was being projected on her brain. Had all that been a mistake? Had Elsa’s mother, by comforting her child, told her that it was okay to shout and flip over tables? It hadn’t seemed like that at the time.

“You think we should . . . You’re sending through a bomb ship?”

“Tit for tat,” he said. “It means keeping traffic out of the ring space for a time. It means not evacuating any more ships until we can make the experiment. But we can show the enemy that we are disciplined. Or we can show it that we aren’t.”

“Oh,” Teresa said. She didn’t know what else there was to say.

Her father tilted his head. His voice was still gentle. Almost coaxing. “This is why I want you with me. These are the decisions people like you and I have to make. Normal people don’t. This is the logic and the vision we have to apply. And we have to be ruthless about it. The stakes are too high for anything else.”

“It’s the only way we can win,” she said.

“I don’t know that we’ll win,” he said. “I’ve never known that. I’ve always known that we’d fight. From the moment the gates opened, I knew we’d go through them. That, and the chances were good that we would encounter whatever had killed the civilization that came before us.”

“Goths,” she said. “Goths and lead-lined water pipes.”

He chuckled. “Ilich has been talking about ancient Rome again. Yes, well. We can call them Goths if you like. As soon as we knew that there was something out there, we knew that we would come in conflict with it. The war was inevitable from the second we had an opponent. I don’t know whether we’ll defeat them. But I know that *if* we defeat them, it will be like this. With intelligence and ruthlessness and an unwavering purpose. Those are the only tools we have that matter.”

Teresa nodded. “I’m sorry,” she said. “I had the wrong answer.”

“I knew you might,” he said. “It’s why I asked you here. You will learn, over time, how to think the way I think. How to be the kind of leader that I’ve taught myself to be. Some of it will take effort. Some of it will happen naturally just because you get older. And some of it, I think, will happen as you . . . change.”

“Change?”

“Transform. Become immortal. I’ve spoken to Dr. Cortázar about beginning the process with you. It will take time, of course, but since I began the treatments, I’ve learned so much. Things I couldn’t know when I was just . . . just human, I suppose.”

He took her hand. The opalescence in his eyes and skin seemed to brighten for a moment. When he spoke, there was a depth to his voice like the room had gained an echo.

“There’s so much that I see now that I never saw before. You’ll see it too.”

Chapter Twenty-One: Elvi

Elvi could see Sagale steeling himself for her reaction. It was in the way he tightened his jaw and the flatness of his eyes. She had one foot tucked into a hold on the wall, her hand on another. She waited for the outrage or the vertigo or some physical sign in herself to match his expectations. What she found was a bleak disappointment.

When he'd called her to his office, she'd suspected it was bad news. Now that the rest of the crew had been decanted and brought up to speed, anything said on the bridge, no matter how softly, was common knowledge in minutes. Fear did that to people. Made them fast to share and gossip.

"If I object to this plan?" she said. "Because we both know I object to this plan."

"I will pass it directly to High Consul Duarte," Sagale said. "It is as important to him as it is to me that you understand how seriously we take your concerns."

"Will it change anything?"

"Candidly?" Sagale said.

"For fuck's sake. Another bomb ship? After . . ." She gestured toward the deck with her free hand, meaning the ring space, the missing gates, all of it. She'd had almost three days to process the enormity of it, and she couldn't. It was too big.

Three days was long enough for Sagale to report in and for Duarte to deliberate and respond. It probably wasn't long enough for Sagale to have pushed back and been shut down. He hadn't even tried. That was the disappointing part.

“We have protocol. It is that when a ship fails to transit, send a bomb ship through the same gate. It’s the only way to keep our message clear.”

“And then see if we can lose another gate or two?”

“The losses that we have suffered are . . . significant,” Sagale said. “But it is the considered opinion of the high consul that they do not represent an escalation on the part of the enemy.”

“How do you even get there?”

Sagale lifted a hand, palm out, but the softening in his eyes made it a request to hear him out more than an order that she be silent. Elvi crossed her arms and nodded him on.

“The attacks the enemy made on us have been ineffective in that—in *that*—they did insignificant primary damage. The loss of consciousness that we experienced in Sol system when Pallas died might have been deadly for the protomolecule’s designers, but it was largely ineffective against us. The response in Tecoma system would have been trivial in any other system. The effect was . . . unfortunate only because of features of the landscape, so to speak, that are not in play elsewhere in the empire.”

“So I just picked a bad Bikini Atoll?” Elvi said.

“No one holds you responsible for what happened, Doctor. You couldn’t have known any more than we could. If anything, the strategic error was mine. I saw the inhospitable nature of the system as an advantage and overlooked the possible consequences.”

He spread his hands.

“Or,” Elvi said, “it was a trap.”

“I don’t see how—”

“No. Be quiet. It’s my turn now. What we saw in Tecoma wasn’t even similar to the previous interactions. We were awake the whole time. It didn’t change our perceptions of anything. That was something different. And if you look at the logic of it? It’s not even hard to see.”

“Walk me through it.”

“That star wasn’t natural, it was created. And it was created from a system that looked like Sol. It was manufactured and it was pointed at the ring gate. They *aimed* it like tying a shotgun trigger to a doorknob. Our

bomb ship did something to activate it. Maybe it got something to come look at us, and that's what set it off. I don't know. But it was built to be a booby trap."

Sagale's scowl looked like he'd bitten into a bad date. "That is an interesting interpretation," he said.

"It fired off the largest gun that it's possible to make given the physical laws of the universe. And what's more? The station was built to withstand it. It took a gamma burst from a collapsing neutron star, and *it's not dead*."

"You find that significant."

"I find that pretty clear evidence that we're way out of our weight class here and we should stop throwing punches!"

"You don't have to shout, Doctor."

Elvi unballled her fists and tried to relax her jaw. Her blood felt hot in her face, and she didn't know if it was from fear or anger or if any normal emotions actually fit into a situation like this. Sagale's system chimed an alert, and he muted it.

"I don't disagree with you," he said. "But what does not throwing punches look like?"

"Not sending bomb ships through would be a start."

"It would. But so would abandoning the gates entirely. Would you recommend doing that? There are colonies that will collapse if we choose that, and maybe those are acceptable losses. But once the trouble began last time, shutting down the gate network didn't save the beings that used it. They were dead when we turned the system back on."

"Not starting trouble was my argument."

"Trouble started long before Laconia existed. Ships have been disappearing for decades. Whatever this is, it began before we recognized it. The fastest way to undermine a strategic plan is to abandon it before there's sufficient reason to do so. The high consul has been briefed. He believes that the tit-for-tat plan still has merit."

"And so you're going to do it."

"I do as I'm told, Doctor. I am an officer of the Laconian military," Sagale said. "As are you."

The mood on the *Falcon* showed in small ways. Instead of wandering to and from the commissary while she thought, Jen remained rooted at her station. Travon moved through the ship tapping his thumb and middle finger together in a fluttering beat every time a new status update came from the *Typhoon* or Medina. Sagale stayed in his office for the most part, avoiding Elvi and Fayez and the rest of the science team as if their disapproval bothered him.

Out near Medina, a captain drew a short straw, and the *Myron's Folly* was chosen as the bomb vessel. On the main screen, a swarm of loading mechs and drones hauled the cargo out of its hold. The little flares of their thrusters reminded Elvi of termite swarms.

The antimatter had been stored on Medina for a moment just like this. Governor Song's engineers would set the ship's reactor as close to critical as they could and disable the fail-safes, so that when the bombs went off, the reactor failure would add its own destructive punch to the mix. But there was the problem of making the ship go dutchman in the absence of other traffic.

The safety curve was based on the amount of matter and energy making transits through the gate network. Usually that meant keeping the flow down to safe levels. Now it meant driving it up past the threshold without sending another ship through. Protocol demanded, Sagale kept pointing out, that the bomb ship be the next thing to go. If they started pushing a dozen other ships through, the enemy might not understand the high consul's point.

To do that, they had to pour a massive amount of energy through the gate. The *Typhoon's* ultrahigh magnetic field projector could do it, but they were making sure there was nothing that would be damaged on the far side of the gate. The combination of caution and recklessness took her breath away.

"I should go talk to him again," Elvi said.

"Tell him that he's wrong more forcefully?" Fayez said. "See if he changes his mind because you disagree at him harder?"

“He’s not that bad,” she said. And then, because she knew that he was, “There has to be something.”

“There doesn’t, sweetheart.”

Jen looked up from her station monitor. Her lips were thin, her gaze restless. “Eighty thousand people in Thanjavur system,” she said. “One habitable planet with three cities, and a moon base on its major satellite. And they’re . . . I just can’t get my head around it. They’re just gone.”

“They might be fine,” Elvi said. “Just . . . out of contact. They may be better off than all of us at this rate.”

“Unless their sun exploded. There are stories about that, aren’t there? The protomolecule engineers burning whole systems?”

Travon fluttered his finger and thumb together again as he worked his station’s monitor. “Thanjavur’s only eight and a half light-years from Gedara. If there’s a big flash in eight and a half years, we’ll know what happened.”

“I don’t like this,” Jen said.

“None of us do,” Fayez said. “Honestly, I think old Sagale would skip this part if he could.”

“What?” Jen said. “No, not that. I mean yes, I don’t like that. But this too.”

She threw a dataset Elvi didn’t recognize onto the main monitor. The *Myron’s Folly* blinked away and a series of energy graphs took its place. Jen turned to look at them as if the significance were obvious.

“I’m a biologist,” Elvi said.

“We’re seeing radiation coming from in between the rings. We’ve never seen that before. There hasn’t been anything there to radiate. This little pocket universe just ends at the rings. Anything that went out was gone like it passed an event horizon. Now, since . . . well, since us? Something’s coming through.”

“Something’s knocking around in the attic,” Fayez said. “That’s not reassuring. I’m not reassured.”

“What do you make of it?” Elvi asked.

“I don’t know. I just have data, and it says something’s happening that didn’t happen before. And it’s not calming down.”

A voice in her memory said the words as clearly and distinctly as if they had been spoken: *Distributed responsibility is the problem. One person gives the order, another carries it out. One can say they didn’t pull the trigger, the other that they were just doing what they were told, and everyone lets themselves off the hook.* She let her breath out slowly from between her teeth.

Elvi opened a connection request to Sagale’s office. To his credit, he accepted it immediately. “Dr. Okoye.”

“Admiral, could you join us on the bridge? There’s some incoming data I’d like you to look at.”

She heard the hesitation while he decided whether it was a ploy to stop the bomb ship plan. Just because the data was real didn’t mean it wasn’t a ploy.

“I’m on my way,” Sagale said, and cut the connection.

“We could always mutiny,” Fayez said brightly.

“We wouldn’t stand a chance,” Travon said. “I did the nav analysis. Even if we took control of the ship, the *Typhoon* could blow us to dust before we got out a gate.”

“Jesus, Travon,” Fayez said. “I was joking.”

“Oh,” Travon said. “Sorry.”

“I remember when I was just a scientist,” Elvi said. “I liked that. It was nice.”

Five minutes later Sagale came on the bridge, floating toward his station like none of them were there. Elvi remembered seeing him in the same place, still damp from the crash couch and weeping. He was a different man now. For a moment, against her will, she admired him. Sagale considered the display in silence. The loudest sounds were the hush of the air recyclers and the flutter of Travon’s right thumb and middle finger.

He considered the energy graphs as Jen explained them again. Sagale took it in impassively. When Jen had finished, he floated quietly in his crash

couch restraints. His gaze flickered to Elvi's, and she thought there was something in them. Gratitude, maybe.

With a gesture, he opened a comm channel.

"Admiral Sagale," Governor Song's voice came. "How can I help you?" It had a hint of Mariner Valley drawl. Elvi wondered if it was the mark of a Martian working for Laconia or a Laconian who'd carried her accent out into the alien worlds and back again. Whether this obedience was peculiar to Duarte's people or if it had been part of the Martian character all along.

"My eggheads came up with an analysis I'd like your eggheads to take a peek at, Governor. It may be nothing, but I'd recommend we hold action on the bomb ship until we know what we're looking at."

There was a long pause. "You have my curiosity, Admiral. Send over what you have."

"Thank you," Sagale said, and the governor cut the connection. "Share that with the *Typhoon* and Medina, Dr. Lively. Let's see if they share your concerns."

"Yes, sir," Jen said, and started packaging her information like she'd been given an extra five minutes on her final exams.

Fayez touched Elvi's shoulder and said, almost too softly to hear, "Do you think we just got away with—"

The universe exploded.

If it had been a sound, it would have been deafening. Elvi put her hands over her ears just the same. A reflex. An approximation. Jen was screaming. Elvi tried to sink to the deck, but only managed to pull her legs up so that she was floating in a fetal position. The curve of the handhold before her was ornate and beautiful. The smudge of darkness where the oil from the crew's skin hadn't been cleaned away was like a map of a vast coastline, fractal and complex. She was aware of Fayez beside her, of the waves of pressure passing between them, touching, and reflecting away as they both screamed. The air was a fog of atoms. Sagale was a cloud of atoms. She was a cloud.

You've been here, she thought. You've been here before. Don't get distracted by it. Don't lose yourself.

The cloud that was her hand, vibrations in emptiness, slipped through the void and clatter to the cloud that was the handhold. Fields of energy between her atoms and the bulkhead's atoms turned into a dance of pressure, and the surge sent lightning up her arm, so complicated it was hard to keep track of. She was aware that she felt it, but there was so much happening it was hard to keep the sensation in mind.

Elvi found that she could see right through the suddenly vaporous ship, and right through the other ship clouds around it. Medina was a vast but wispy thunderhead at the center of them all.

Something was moving through the clouds, dark and sinuous as a dancer slipping between raindrops. And then another. And then more. They were everywhere, sliding through the gas and liquid and solid, scattering the clouds with their passage. They were solid. Real in a way the clouds of matter were not. They were more real than anything she'd ever seen. Tendrils of darkness that had never known light. That *could* never know light. *You've seen this absence of light before. A darkness like the eye of an angry god . . . You said that to someone.*

One darted and swirled, off to her left if left meant anything now. It furred like a question mark, and the pattern of atoms and vibrations swirled around it and into it. The beauty of it, the grace, were hard to look away from. Clouds mixed and swirled together in its wake, colors so pure they were only colors. It took effort to recognize they were blood.

She'd been here before. It had been overwhelming the first time. It was overwhelming again now, but at least she knew what it was. That made holding her mind together possible. At least for a moment.

You're doing great, kid. You're doing great. You can do this. Just a little more. But do it now . . .

She tried to remember what her throat was. Tried to imagine that the dots of matter and emptiness had said words before. That they still could. They were her body, the air she breathed. She tried to make it all work together long enough to scream.

Emergency evacuation. Major Okoye authorization delta-eight. A tendril of darkness darted toward her . . .

. . . and dropped away. All of them slid away, falling like black snowflakes through the cloud of vibrations that was the deck. Everything swirled, one form folding into another. If she unfocused her eyes, she could just recognize them. Jen's body, rolling as maneuvering thrusters made the deck into a hillside. Someone's arm from fingers to elbow, and even a few centimeters of flesh beyond. The glow of the main display, too much itself to hold any meaning beyond the simple elegance of photons caught in air. She was aware of her own pain like it was the sound of a distant waterfall. She fell through it and into something like sleep.

And a blink later, she was back. Thrust that could have been a third of a g or five gs pulled her down. When she forced herself to sit up, blood glued her cheek to the deck. The air stank, but with too many different volatiles to make sense of. Alarms were sounding, echoing off each other in a meaningless cacophony. Everything had gone wrong at once. She hauled herself up to standing.

The bridge was a thing from a nightmare. Swaths of the bulkheads, decks, equipment were gone. Like an artist had come in with an eraser and taken away bits of it at random. And the others too.

Sagale was still at his post, a long loop of his head and right shoulder simply vanished. Jen lay in a still pile where the deck met the wall, covered in blood that might have been her own. Travon's arm lay beside his station, but where his crash couch had been, there was a soft-edged hole down to the next deck and the one below that. It was like seeing a coral reef made from her ship and her friends and—

“Fayez!” she screamed. “Fayez!”

“Here,” his voice said behind her. “I’m here. I’m okay.”

He was in two-thirds of a crash couch. The fluid in the reservoir had all poured out and down and away.

“I’m okay,” he said again.

“Your foot’s gone,” she said.

“I know. But I’m okay,” he said, and closed his eyes. Elvi stumbled to the console that looked most nearly intact. It was hard to walk, and she

didn't know why until she looked down and saw that a scoop of her thigh the size of a softball was missing. As soon as she saw it, she felt the pain.

A lesser ship would have been dead a hundred times over, but the *Falcon* was hardy. Its skin had been cut a hundred times, and it had regrown fast enough to keep in air. The reactor was throwing errors and emergency corrections, the log spooling so fast she couldn't keep track. She pulled up the sensor arrays, and stars appeared on her screen. The ship was out of the slow zone. Free of the rings. The system identified Laconia's sky. She turned the ship's attention back to the ring gate falling away behind them. It looked calm. As if nothing at all odd had just happened. She felt laughter burbling up in her throat and tried to keep it down, uncertain whether it would stop once it got started.

She opened a broadcast channel and prayed that enough of the *Falcon* still existed to get the signal out. For a moment, the system didn't respond and her heart sank. Then the transmitter hauled itself to life.

"Thank you," she told the ship. "Oh, thank you, thank you, thank you."

She gathered her strength, wondering how much blood she'd lost. How much she had left.

"To any ship in range. This is Major Elvi Okoye of the Laconian Science Directorate. I am in need of immediate aid. We have mass casualties—"

Chapter Twenty-Two: Teresa

I've never seen anyone that angry before," she said. She was telling the story of little Monster Singh and her mother. "I mean, I've probably been mad, but this was different. This girl was . . ."

"Seriously? You're one of the angriest people I know, Tiny," Timothy said.

His food recycler was in pieces laid out on a blanket, everything carefully in place like an exploded drawing of itself. Only the built-in power supply was still inside the frame. Timothy was going through the components now, cleaning and polishing each one. Looking for the signs of wear. Teresa sat on his cot with her back against the cave wall, her legs pulled up in front of her and Muskrat snoring contentedly at her side. A repair drone lurked at the edge of the light, its bulbous black eyes looking vaguely hurt that Timothy wasn't letting it take care of the equipment.

"I'm not an angry person," she said. Then, a moment later, "I don't think I'm angry."

Timothy tossed her a pair of dark goggles and motioned for her to put them on. She did, and put a hand over Muskrat's eyes so that she wouldn't be blinded. After a few seconds, the light of a welding torch burst in her vision like a tiny green star. The smoke was acrid and metallic and she liked it.

"Thing is," Timothy said, loud over the roar of the torch, "there's only a couple kinds of anger. You get angry because you're afraid of something or you get angry because you're frustrated." The torch turned off with a pop.

"Safe?" Teresa asked.

“Sure, you can take ’em off.” When she did, the cave seemed brighter than when she’d put them on before. Even with the intensity of the light, her eyes had adapted to darkness. She scratched Muskrat’s ears as Timothy went on. “If you’re . . . I don’t know. If you’re scared maybe your dad isn’t the kind of guy you thought he was, you might get angry. Or you’re afraid no one’s got your back. Like Nutless.”

“His name’s Connor,” Teresa said, but she smiled when she said it.

“Yeah, him,” Timothy agreed. “Or maybe you’re afraid he made you look stupid in front of your crew. So you get angry. If you didn’t give a shit whether your old man lived or died? If Nutless and your crew didn’t matter to you? Then you’re not angry. Or the other way? You’re trying to get something to work. A conduit to fit. Been working at it for hours, and just when it’s looking about right, the metal bends on you and you gotta start over. That’s angry too, but it ain’t scared-angry. It’s the other one.”

“So you look at me,” Teresa said, derision in her voice, “and you think I’m scared and frustrated?”

“Yep.”

Teresa’s mockery died, and she hugged her knees. It didn’t fit at all with who and what she thought she was, but something in her leaped toward his word. It felt like recognizing someone. Like catching a glimpse of herself from an angle she’d never seen before. It was fascinating.

“How do you deal with it?”

“Fucked if I know, Tiny. I don’t do those.”

“You don’t get angry?”

“Not out of fear, anyway. I don’t remember the last time I was afraid of something. Frustration was more my thing. But I had this friend, and I watched her die slow. I couldn’t do anything about it. That was frustrating, and I got angry. Started looking for a fight. But I had another friend who straightened me out.”

“How?”

“She beat the living shit out of me,” Timothy said. “That helped. And ever since then, nothing has seemed like it was worth getting too bent out of shape over.”

He rolled a bright silver cone about the size of a thumb in his palm and scowled.

“What is it?” she asked.

“Injector’s getting a little ragged at the mouth is all,” Timothy said. “I can touch it up. Just means I’ll be drinking my yeast patties more than eating them.”

“You spend a lot of time with that thing.”

“You take care of your tools, your tools take care of you.”

Teresa leaned against the wall. The stone was cool against her back. Deep cave temperatures were the measure of the underlying climate average. Mass and depth smoothed out the daily highs and lows—even the annual fluctuations of summer and winter. She knew it intellectually, but she hadn’t understood it until Timothy’s cave. The way it always felt cool in the heat and warm in the chill.

“You know, the wise man living alone on the mountain is really cliché,” she said, smiling when she said it so he wouldn’t think she was being mean. “Anyway, I don’t have anything to be scared of.”

“Assassins with pocket nukes for one,” Timothy said, slotting the injector back into its housing.

Teresa laughed, and after a second, Timothy smiled too.

“If anyone’s going to kill me, it’ll probably be Dr. Cortázar,” she said.

“Yeah? Why’s that?”

“It’s just a joke. I was watching Holden, like we talked about? And I heard this conversation he and Dr. Cortázar were having.”

“What about?” Timothy asked, idly.

Teresa thought back. What had they been talking about exactly? Mostly she remembered Cortázar talking about how nature ate babies and Holden looking into the camera. But it had been about her father too.

She took in a breath, ready to speak, and the air rattled against the back of her throat and down into her lungs like a billion little molecule-sized marbles banging against the soft tissue. Her respiration system was a cave inside Timothy’s cave, and she was acutely aware of the complexity of her own body and the answering complexity of the caverns around her. Veins

and chips in the wall before her fragmented and smoothed together. Gravity trying to tug her down into the floor, and the astonishingly complex dance of the electrons in the stone and her flesh pushing back. She managed to wonder if she'd been drugged before her awareness was overwhelmed by the immediacy and complexity of the air and her body and the increasingly invisible boundary that failed to really divide her from the world . . .

Muskrat barked anxiously. She'd slumped down on the cot at some point without knowing she was doing it. Timothy stood up, his expression perfectly focused and his recycler forgotten. The repair drone made a weird yipping sound as it tried to stand up, staggering drunkenly.

"That wasn't just me, right?" Timothy said.

"I don't think so," Teresa said.

"Yeah, all right. It's been fun, Tiny, but you need to head home now."

"What was that? Is there something wrong with the air in here? Are there fumes?"

"Nope," Timothy said, taking her by the arm and lifting her to her feet. "Air's fine. That was something else. And it probably happened to a lot of people, so they're gonna be scared, and they're going to want to find where everyone important to them is, and that's you. So you need to be not here."

"I don't understand," she said, but Timothy was pulling her forward, toward the mouth of the cave. His grip on her arm was like a vise. His expression was blank. It made him frightening. Muskrat followed behind, barking like she was trying to warn them of something.

In the open air, the world was normal. The strange sensations she'd had before already seemed like a bad dream or an accident. Timothy's reaction was the only thing that made it frightening. He looked up, scanning the sky, then nodded to himself.

"Okay, Tiny. You and the furball head back home."

"I'll come back as soon as I can," she said. She didn't know why she wanted to reassure him.

"Okay."

It was the way he said it. Like his mind was already someplace else. She'd had adults treat her like that before—polite and agreeable, but

elsewhere. Never Timothy, though. He was different. He was supposed to be different.

“Will you be here when I do?”

“I’ll have to, I guess. I’m not done yet, so—”

She hugged him. It was like hugging a tree. He pulled back, and when he looked at her, she thought there was something like regret in his expression. It couldn’t have been pity.

“Good luck, Tiny,” he said, then turned back toward his cave and was gone. Muskrat barked once and looked after him, as worried as Teresa was.

“Come on,” she said, and started for her secret passage back into the State Building and home. The afternoon was cool. The leaves were starting to retreat back into their winter sheaths, leaving the trees looking stubbly. A sunbird hanging on a low branch opened its leathery wings at her and hissed, but she ignored it. At the horizon, wide clouds bunched and trailed gray veils of storm. If they came this way, the drainage tunnel would be impassable and she’d be stuck outside the walls. She picked up her pace . . .

The sound of the flier started as a high and distant whine, but it grew louder quickly. Less than a minute after she first noticed it, the sound was a roar. The black laminate body and three cold thrusters appeared over the treetops and fell into a thin meadow, hardly more than a break between trees. When the door popped open, she expected to see the light-blue uniforms of security. She prepared to identify herself and explain that she’d decided to go for a hike. It was only partly a lie.

But while there were two armed guards, the first person out of the flier was Colonel Ilich. He trotted toward her, and his face was dark. The thrusters didn’t cycle all the way down, so when he reached her, he had to shout.

“Get in the flier.”

“What?”

“You need to get in the flier now. You have to get back to the State Building.”

“I don’t understand.”

Ilich's jaw clenched and he pointed at the open door. "You. There. Now. This isn't difficult."

Teresa stepped back like she'd been slapped. In all the years Ilich had been her tutor, he had never been mean to her. Never been anything but patient and supportive and amused. Even when she didn't do her work or did something inappropriate, the punishment was just a long talk about why she'd made the choices she did and what the goals of her education were. It was like seeing a different man in an Ilich suit. She felt tears welling up in her eyes. She saw *Oh, for fuck's sake* on his lips, but she couldn't hear it.

He made a little bow and gestured her forward like a servant making way for his master, but she felt the impatience in it. The contempt. The anger.

Oh, she thought as she walked to the flier. *He's frightened.*

At the flier, Muskrat balked, and before Teresa could coax her in, Ilich assigned one of the guards to go back on foot with the dog. The flier's door closed with a deep clank, and they lurched up over the trees. Even though the body of the flier had looked opaque from the outside, it was no darker than tinted glass from her seat. She could see the State Building clearly as soon as they cleared the top branches.

"How did you know where I was?" Teresa asked.

Ilich shook his head, and for a moment she thought he wasn't going to answer. When he did, his voice had more like its usual tone: patient and gentle. The difference was that now she knew it was a mask.

"You had a locator implanted in your jawbone when you were born. There is never a moment when security doesn't know how to find you, and your safety is part of my sacred duty."

It was like hearing a language she almost understood. She could pick out the meaning of each word, but she couldn't quite make sense of the whole. The idea was too foreign. Too wrong.

"Your father felt it was important for you to have some experience of rebellion and autonomy, so he permitted your excursions so long as they didn't take you too far from the State Building. He said he was solo free-climbing on the surface of Mars at your age, and that he learned things

about himself that way. He hoped you would find use in the same independence and solitude.”

Solitude. He didn’t know about Timothy, then. There was nothing on any world that would make her tell him either. She felt the buzz of outrage in her throat. “So you just let me *think* . . .”

The flier passed over the outer wall of the State Building and curved around to the east. They weren’t heading for the landing pad but the lawn outside the residence. A single figure stood in the gardens, watching them pass. She thought it was Holden.

“I respected your autonomy and your privacy to the extent that security protocols permitted,” Ilich said. “But I needed to be able to find you in case there was an emergency.”

“There’s an emergency?”

“Yes,” he said. “There is.”

Her father smiled at her, the wrinkles at the edges of his eyes deeper than she remembered them. The opalescence in his iris was more pronounced, and something seemed to glow from under his skin. His study had been a bedroom, back when he’d still slept. That hadn’t been for years. Now it had a desk hand carved from Laconian wood with a grain like sedimentary rock, a wide table, a shelf with half a dozen physical books, and the divan where he was sitting. Where he had been sitting when the change came.

“Father?” Teresa said. “Can you hear me?”

His mouth changed into a little o, like he was a child seeing something marvelous. He reached out, patting at the air beside her head. She took his hand, and it was hot.

“Has he said anything?” she asked.

Kelly, her father’s personal valet, shook his head. “A few things, but none of it made sense. After it happened, I came to see him, and he was like this. Just like this.” He nodded to Cortázar, sitting on the edge of the table. “I got Dr. Cortázar as quickly as I could.”

“Your opinion?” Ilich asked. His voice was cool, and her father didn’t react to it at all. “What’s wrong with him?”

Cortázar spread his hands. “I could only speculate.”

“Then do,” Ilich said.

“The . . . event. The lost consciousness? It seems to match what Admiral Trejo reported from Sol system. The theory I always heard was that it’s the weapon that killed the protomolecule engineers. However their minds were organized, this . . . effect broke it. Well, the high consul has been making himself more and more like the builders for years now. It might—*might*—leave him more vulnerable to the attack than the rest of us.”

Teresa’s chest hurt like someone had punched her sternum. She sank to her knees at her father’s side, but he was frowning at something behind her. Or nothing.

“How long before he gets better?” Kelly asked.

“If I had been permitted to have more than one test subject, I might be able to guess,” Cortázar said. It was the same tone of voice he’d used to say *Nature eats babies all the time*. It made Teresa’s skin crawl. “As things are? He could come back to himself in a moment. He could be like this for the rest of his life, which in his case could be a very long time indeed. If I can take him to the lab and run some tests, I might get more insight into the question.”

“No,” Kelly said, and it was clear from his tone it wasn’t the first time he’d said it. “The high consul stays in his rooms until . . .”

“Until what?” Cortázar said.

“Until we have this situation under control,” Ilich said, firmly. “Does anyone outside this room know about his condition?”

The high consul’s terminal chimed, a high-priority connection request. The three men looked at each other in alarm. Her father scowled, then farted like the blare of a trumpet. The perversity and indignity of it cut Teresa like a blade. This was her father. The man who ruled all humanity through his vision and audacity. Who knew how everything was and was supposed to be. The body in front of her was only a crippled man, too

broken to be embarrassed. The chime came again, and Kelly grabbed it with his hand terminal.

"I'm afraid the high consul can't be disturbed," he said as he walked out of the room. "I can accept a message for him."

The door closed behind him.

"I can bring some equipment here," Cortázar said. "It won't be as good as having him in the pens where the real equipment is, but I could do . . . something."

Ilich ran a hand over his scalp, his gaze flickering from her father to Cortázar to the window that looked out over a bamboo garden in some different universe where the sun still shone and life wasn't broken. Teresa shifted, and Ilich looked at her. For a long moment, their eyes were locked on each other's.

She felt a wave of panic. "Am I supposed to be in charge now?"

"No," Ilich said, as if her fear had resolved something. "No, High Consul Winston Duarte is in charge. He is deep in consultation with Dr. Cortázar on matters critical to the state of the empire, and cannot be disturbed under any circumstances. It's easy to remember, because it's true. He specifically ordered Kelly to keep anyone but the doctor here and you, because you're his daughter, away from the residences until further notice. Do you remember him saying that?"

"I don't—" Teresa began.

"You need to remember him saying it. He was sitting right here. It was just after the event. We all came back to ourselves, and he told Kelly in front of you that he needed Dr. Cortázar, and that he couldn't be disturbed. Do you remember?"

Teresa pictured it. Her father's voice, calm and sturdy as stone.

"I remember," she said.

Kelly came back in the room. "Something happened at the ring. The *Falcon* made an unscheduled transit. Now it's putting out a distress call. A relief ship is on the way, but it won't be there for hours. Maybe as much as a day."

“All right,” Ilich said. “We need a secure channel to Governor Song and Admiral Trejo. Someone will have to take over coordinating the military. Apart from them, no one can know anything.

“Until we get the high consul back to himself, our little conspiracy here is the empire.”

OceanofPDF.com

Chapter Twenty-Three: Naomi

The plume of energy that came from the ring gate was invisible to the naked eye. An optical telescope would have seen at most a few flares of brightness where bits of matter caught in it glowed for a moment as they were ripped apart. Moving at the speed of light, it flared into the space where ships coming into Auberon or preparing to leave it were most likely to be, widening like a wave with distance, hundred thousand kilometers after hundred thousand kilometers, spreading out like a cone. If it became less powerful as it spread, it wasn't enough to help the *San Salvador*. The Transport Union ship had been slow moving out of the restricted zone, and almost instantaneously, it and everyone aboard it became a cinder.

Naomi sat in the commissary and played the newsfeed of its loss in a loop, watching the ship flare white and die so quickly the frame rate couldn't quite make sense of it. She had spent very nearly her whole life on ships and stations. She'd been on six ships that had suffered micrometeorite hits, two that had lost atmosphere from them. Once, she'd had to drop core to keep her reactor from blooming out like a tiny, brief sun. She'd jumped between ships without a suit, and the feeling of breathing vacuum still came to her in nightmares decades after the fact. She would have said she was intimately aware of all the dangers life outside an atmosphere could hold.

This one was new.

"Did *they* do this, you think?" Emma asked, hunched over her bulb of morning tea. The *Bhikaji Cama* was in its braking burn now. The one-third g had felt strange until Naomi realized she'd never been in the crewed parts of the ship when there was up and down before. After that it still felt strange, but she knew why.

“*They* Laconia or *they* Saba’s people?”

Emma lifted her eyebrows. “I meant the first, but either.”

The crew clumped around the commissary in quiet groups of two or three, and they treated each other with the brittle courtesy of a funeral. Some of them had likely known the crew of the *San Salvador*, but even if they didn’t it had been a ship like theirs. Its death reminded them of their own, still somewhere down the line, but coming.

“I don’t know,” Naomi said. “The point of having the *Typhoon* in with Medina was always that they could defend every gate at once. Hit the station with its magnetic field projector and all the gates bake anyone that’s too close, but . . .”

“I saw the data from when they did that. It wasn’t this big.”

“It wasn’t even close,” Naomi agreed.

Emma sipped from her bulb, hunched in a degree more, and lowered her voice. “Did we make a play? Did we try to take the slow zone?”

“If there was an attack planned, I didn’t know about it,” she said, but with a knot in her gut. She didn’t think Saba would have put together something that audacious without her, but maybe he would. She had been arguing for restraint and less violent, longer-term strategies. If all she’d managed was to cut herself out of the loop . . . She imagined Bobbie and Alex and the *Gathering Storm* burning in toward the gate with a ragged and improvised fleet. They *couldn’t* have been that stupid. But even if they had, the gamma burst from the gate had been so much more powerful . . .

“Can you find where we put my system?” Naomi asked. “If I can rebuild it, I might be able to find Saba’s signals. Get a report.”

“Could hunt it down, maybe,” Emma said. “But we’re putting you on a shuttle for Big Moon in four hours, get you out before we’re in range of the transfer station. Doesn’t leave much time.”

“So we hurry.”

Finding all the spare parts of her former cell was harder now that thrust had changed the nature of the architectural space, but Naomi didn’t need all of it. The physical hardware had some built-in security that made finding the hidden messages easier, but without the keys and information that she

kept only in her own memory, they'd have been useless. Her records from the long passages in the storage container were wiped. Even if the Laconians had found the devices, they wouldn't have been able to pull the secrets of the underground from them. But neither could Naomi.

Emma drove a loading mech, shifting the heavy pallets that they'd moved before, and Naomi found the pieces she needed—the signal processor from her crash couch, a monitor different from the one she'd had but close enough, a hand terminal interface. They set up in a workroom by the machine shop. Neither of them had said it, but they both knew that everything would be broken down again and hidden away when they were done.

The workroom was small and grimy, with long, discolored patches on the fabric walls. The tool racks had been used for so many years that the ceramic was wearing through and the titanium bones glittering under it. It smelled like oil and sweat, and Naomi liked it better than anyplace she'd been on the *Cama* before.

She looked through all the usual places where Saba hid communications for the underground, but most of them weren't there at all. Not just empty of hidden messages, but whole channels missing. The Transport Union's coordination feed—the running record of ship locations and vectors—was just a repeating standby message. The entertainment feed from Medina of a young man talking breathlessly about the three-factor philosophy of design for hours on end wasn't transmitting at all. Medina's communications channels were closed for business, covert or otherwise.

"That a good thing, or bad?" Emma asked.

"I don't know what it is," Naomi said.

"Got to get you to a shuttle soon."

"Just another few minutes."

Emma shifted her weight, trying not to show her impatience. It wasn't just the time pressure on the shuttle. Everything about the situation itched.

Naomi was almost ready to resign herself to failure when she found the message. It was hidden in false-static fluctuations under a navigation beacon for the repeaters that ferried comm signals across the interference of

the gate. The encryption was key based, and it took her six tries to find the right one. When it popped onto the monitor, it was text. No voice, no picture. Nothing to show that it had come from Saba apart from the fact of its existence.

MAJOR INCIDENT IN THE SLOW ZONE. SUSPEND ALL OPERATIONS AND SHELTER DOWN. NO IMMEDIATE THREAT TO THE ORGANIZATION, BUT ENEMY SURVEILLANCE HIGH. NO TRANSITS IN OR OUT OF ANY GATE BY ORDER OF LACONIA. TWO GATES LOST. UPDATE TO FOLLOW.

“ ‘Two gates lost?’ ” Emma said. “What the hell does that mean?”

“Be patient and find out, sounds like,” Naomi said. She shut down her system, the words blinking into darkness.

The shuttle was a two-couch model. No Epstein drive, but an efficient teakettle good enough for orbital transits that didn't take more than a month or two. She wasn't going to be on it for more than a couple of days. It was the kind of thing a new prospector would rent for claim surveys or an old couple for a long, slightly adventurous vacation. Naomi felt Jim's absence even though he'd never been on board it. As the *Bhikaji Cama* dropped away behind her and she did her first sustained burn toward Auberon's lunar outpost, she checked the transponder output. A day ago, the shuttle had been a maintenance and safety vehicle for the Transport Union. Today, it was a rental craft registered to Whimsy Enterprises and had been for the last year and a half. The ship didn't care what story they told about it. It worked just as well either way.

She set the local censored newsfeed to play for a while, using the thin-faced, cheerful man spouting the Laconian official positions as a kind of white noise while she thought. In the hours she let it play, neither he nor the dour and serious woman who took his place mentioned Medina or the *Typhoon* or the gamma radiation burst. Or how someone could *lose* two ring gates. She tried to reassure herself that, whatever was going on, it at least wasn't Bobbie and Alex charging into the teeth of a *Magnetar*-class

battleship and dying. There was even the chance that the crisis, whatever it was, would open some opportunities for the underground. With her bottles gone, she'd have to find another way to get messages back to Saba.

Auberon was one of the success stories of the new systems. A wide, lush planet with clean water, hundreds of viable microclimates, and a tree of life that coexisted with Earth's biochemistry in a kind of mutual indulgent neglect. The story was that a farm on Auberon could grow native plant analogs and Terran crops side by side, with each acting as fertilizer for the other. It sounded like an exaggeration, but there was a seed of truth there. Food and water weren't a struggle on Auberon the way they had been on so many of the other worlds. It had twelve cities with populations over a million and a wide scattering of smaller towns, farms, and research stations. A lunar station that fed cargo and supplies through the near asteroids and a handful of dwarf planets big enough to have civilian populations. It had almost one-tenth of a percent of Earth's population at its height, and it had been self-sustaining for over two decades.

Naomi found the place a little creepy.

The docks, when she reached them, were cleaner than any she'd seen in a lifetime traveling through Sol system. It wasn't just the eerie perfection she disliked, though. The void cities that had been, for a time, the dream of Belter culture made real had been as new and shining and optimistic as Auberon's lunar base. But they had been rooted in history. Everything in Sol system, from the great port of Ceres to the rock hoppers digging ore and water from asteroids that were hardly more than a hold's volume of gravel, had come from a shared past. Yes, the expansion into the void had been bloody and cruel and filled with as much violence as cooperation, but it had been real. Authentic.

There were no old levels in the station, because there was no old. On Ceres, there were neighborhoods built in the excavations where the great engines that had spun the asteroid up had been housed. On Ganymede, there were levels of tunnels that had been abandoned in the war and never recovered. On Earth, there were cities built on the ruins of the cities before them, layer after layer back through millennia. Auberon was a theme park

version of itself. A prefabricated culture that could have been assembled anywhere with equal cheerfulness. It didn't feel human.

The Whimsy Enterprises office was a closet-sized door between an ice cream shop and a land claims lawyer. Inside, the air smelled like hydroponics tanks and fresh plastic. A woman her own age with close-cut hair stood at the kind of desk Naomi expected to get takeaway food from.

"Hello," the woman said with a barely repressed grin.

"I have a ship I've brought back," Naomi said.

"You don't remember me, do you?" the woman said. "Not your fault. It was a long time ago. I crewed your ship."

"My ship?"

"The *Rocinante*, under Captain Holden. Back in the bad old days, when the rocks fell. You were busy at the time, sa sa que? With that fucker Inaros. Looked like you'd been through a recycler when we pulled you off that racing pinnacle."

Naomi's brain stripped away the years, filled in the woman's cheeks, undid the gray of age. She was a pilot. She'd worked for Fred Johnson on Tycho. "Chava Lombaugh?"

"Welcome to Auberon," Chava said. "You can talk freely in here. I sweep for surveillance every other day, and I made a special pass when I heard you were coming."

Naomi walked to the desk and leaned against it. "Thank you for that. Do you know what's going on?"

"Not in specific," Chava said, "but I can say that the Laconian security forces have been shitting themselves boneless since that first no-transit alert came. We haven't been able to decrypt their feeds, but the volume of traffic has been huge. Governor Song was pushing like hell to get every ship she could out of the slow zone before the gamma bursts, and now she's not letting anyone in or out."

"Do you have a way to reach Saba?" Naomi asked.

"The Laconians have been updating the security on the repeaters," Chava said. "I still have a couple back doors, though."

“Are you sure they’re secure?” Naomi asked, and her voice echoed strangely, like she was hearing more of it than usual. Undertones and overtones rippling against each other as the vibrations touched the hard surfaces of desk and floor and wall and rebounded to make new complexities. She stepped back as Chava’s eyes widened. She could see the wetness in them, the tiny dark dot of her tear duct, the river pattern of blood in the whites of her eyes like a map of an unknown world.

“Fuck,” Chava said, and it was a symphony. Overwhelming and complex. Naomi felt herself falling into the sound and the wide, full, complicated air—

When she came back to herself, her head was pressed against the abrasive industrial carpeting. Chava was still at the desk, her face bloodless. She looked around the room, trying to focus, trying to find Naomi. It took a few seconds.

“What . . . ,” Chava said. “What was”

“It’s the same thing that happened in Sol system when they killed Pallas. How long have we been unconscious?”

“I . . . don’t”

“Do you keep logs? Security tapes?”

Chava nodded, working up from barely a tremor until she was bobbing her head so much it seemed like it would be hard to stop. She opened a screen on her desk display. Nothing inside the room, but a view of the front door from outside. As she rolled it back until Naomi appeared, an alert tone came over the station’s public speaker loud enough to hear even inside the office. *This is a public security announcement. Please remain where you are. If you are in need of assistance, use the emergency alert on your hand terminal, and government responders will come to you. Do not seek help on your own. Do not leave your homes or places of business.*

“Three minutes,” Chava said. “It’s like time just blinked out.”

“Is there a *Magnetar*-class battleship in Auberon? That’s the only thing I know that does that . . . or almost the only thing.”

“No, nothing like that.”

“We have to risk your back doors on the repeater. We have to get a message to Saba. Something’s going on here, and if it’s related to whatever happened that got Laconia worried, he may need to know about it.”

Chava gestured for Naomi to come around the desk. “Follow me,” she said.

Chava’s office was small, with white, generic furniture of ceramic and steel, but it was well equipped. Naomi sat at the other woman’s desk and built a short message, typing fast and not worrying about errors. The Auberon gate had a fifty-five-minute light delay from the planet. Even if Saba wrote back at once, it would be two hours before she heard, and it might take him longer.

In the long wait, Chava made them chamomile tea from the office supplies. The sweetness cloyed, but Naomi drank it anyway. It was something to do. The security alert came off an hour and thirty-five minutes after it started. *The station is safe and secure. Please return to your normal activities.* It seemed optimistic to the point of being naive.

Chava Lombaugh’s system chirped ten minutes shy of the two-hour mark, and she slapped open the new message like it had stung her. As she read it, she bared her teeth.

“What is it?”

“It’s nothing,” she said, and shifted the monitor for Naomi to see. TRANSMISSION ERROR. REPEATER NOT RESPONDING. MESSAGE QUEUED FOR LATER DELIVERY.

“The repeater’s down?” Naomi said.

“Theirs is,” Chava said. “The one inside the ring. The Auberon-side repeater generated this message, but the two aren’t talking to each other. We might be able to do something else, though. Ring gate interference is a bitch, but it’s not impossible to punch through. I have some ships in the rental fleet with tightbeams, and if I got one close . . .”

Naomi shook her head. “No. Nothing obvious. I want him briefed, but not at the risk of exposing the organization. Saba can get the message when he can get the message. He knows how to find us once he does.”

Chava made a frustrated sound at the back of her throat and slammed down the last of her tea. “Let me take you to the safe house, then. At least we can chew our nails someplace comfortable. Laconia takes the repeaters seriously. Whatever the issue is, getting the communications network back up will be high on their to-do list.”

“Thank God for the efficiency of the enemy,” Naomi said, making it a joke. Chava even laughed at it a little.

But a day later, the repeater was still down. And the day after that. It was almost a week before a high-speed probe made the long journey to the ring gate and through it, and sent back the images that even the censor’s office couldn’t keep a lid on.

Auberon system—Naomi and Chava and the crew of the *Bhikaji Cama* included—saw the swirling colors that had replaced the darkness between the ring gates. They found out why the repeater on the slow zone side of the gate wasn’t responding. It was gone, and so were all the other repeaters like it. And the *Eye of the Typhoon*. And Medina Station and all the ships that had been quarantined inside the ring space. Only the alien station at the center remained, glowing bright as a tiny sun.

Naomi looked at it all until she was on the edge of vertigo, then looked away and had to go back to check that it was real. Over and over again, locked in a cycle of disbelief.

All human existence in the small artificial universe between the gates had been wiped away as if it had never been there at all, leaving no sign of what had killed it.

Chapter Twenty-Four: Bobbie

The bar was worse than shitty. Shitty had character. The place was generic. Fake stone meant to echo a tunnel on Ceres or Pallas marked with graffiti to make it look edgy until you noticed that the pattern of it repeated every couple meters. The appearance of counterculture as churned out by a corporate designer. The food wasn't bad. Vat-grown ribs in a hot marinade and vegetable kibble that hadn't been cooked to a mush. The beer was decent, if a little hoppy for her taste. A screen at the back usually played highlights from football games around the system. Now it was playing a newsfeed. And while most of the time the screen was a background for the conversations and drinking, today everyone was watching it.

"The event mirrors the one experienced when the *Tempest* was forced to employ its magnetic field generator against separatist forces on Pallas Station," the woman on the screen said. She was pale skinned, with long, dark hair and a serious expression. Bobbie thought the broadcast was out of Luna, but it could as easily have been Ceres or Mars. They all looked the same these days. "But while the previous effect had a clear trigger and was restricted to Sol system, the few ships that have made the transit into Sol since the event report that this was much more widespread, possibly affecting all known systems.

"The loss of Medina Station and the *Typhoon* along with all civilian ships in the ring space is assumed to be related, but no official report has been released at this time to confirm that."

Caspar made a low sound, something between a cough and a chuckle. Jillian, across from him, lifted her chin as a question.

“More critical than their pet journalists usually are,” Caspar said.

“You can still see the censor’s arm up her ass working her lips,” Jillian said. “If we had a free press, they’d be tearing these bastards eight new assholes an hour until we got an explanation.”

An old man in a collarless shirt appeared on the screen with the dark-haired newsfeed host. He was smiling as anxiously as if the camera were mugging him. There was a chyron identifying him and his credentials, but the screen was too far away and the print too small for Bobbie to make them out, except she thought his first name was Robert. She leaned forward, trying to hear better.

“What can you tell us about these events, Professor?” the host asked.

“Well, yes. Yes. The first thing, of course, is that it’s a mistake to use the plural, yes? *Events* plural. What we’re seeing is better understood as a single, nonlocal event. Which fits with everything we’ve learned about the . . . I don’t like to say alien life. Too many presumptions. Call it the previous tenants and their enemies.” The old man’s smile grew a little warmer, amused by his own joke. Bobbie thanked the good angels that she’d never taken a university course from him.

Jillian sneered. “They just lost one of their battleships, the central traffic control for the ring gates, a shitload of ships, and two whole fucking gates, and they want to talk about the limits of locality?” She pointed to the screen with a pale bone that had recently been wrapped in rib meat. “These people are idiots.”

Caspar shrugged. “We just lost the underground coordination from Medina and we’re having beer and barbecue.”

“We’re idiots too,” Jillian said.

“You are, anyway,” Caspar said, but he smiled when he said it.

The announcement that the Sol gate was closed for business until further notice had been bad. No one on her crew had said anything to her directly, but they hadn’t had to. No ships in or out of the system didn’t make the

shell game impossible. They might still be able to escape. Sneak off Callisto and find a Transport Union ship to hide in. But even if they did, that ship wouldn't be going anywhere until the quarantine was lifted. Any hope of slipping out to a different system, hiding on some undeveloped moon until the attack in Sol system blew over was lost. Instead, they'd be trying to hide from the tiger without leaving its cage.

Then things got worse.

Bobbie was asleep when it happened. It had been getting harder and harder to get any rest. She'd pull herself onto her cot in what had been a warehouse office, kill the lights, and her mind would launch into scenarios of escape or capture or violence, running through every combination of circumstances she could invent. She felt lucky to get five full hours in a cycle, so when she woke up groggy and confused, she'd thought it was just exhaustion finally catching up. It wasn't until her hand terminal chirped to let her know that everyone from her crew to the Callistan emergency service to the top newsfeeds in the system had been trying to get her attention that she understood something deeper had happened.

“The important thing to understand,” the old man said, looking into the camera like he was everyone's kind uncle, “is that while these incidents can be very upsetting and certainly they have caused some accidents when people were in the middle of sensitive or dangerous activities when they came, they pose no real threat in and of themselves.”

“Can you explain that?” the host asked.

“These spells have not been shown to have any long-term effects. There is no indication that they are more than an inconvenience, really. It's important, of course, to keep in mind they may happen, at least until the Science Directorate understands the cause and . . . ah . . . *control* of them. Until then, we should all make sure fail-safes are engaged on our vehicles and equipment. But that's good advice in any case, yes?”

Caspar roughened his voice, mimicking the old man. “And don’t concern yourself with the fact that it destroyed gates and battleships. Oh my, no. Don’t worry your pretty little heads about that.”

“Where’s Alex?” Bobbie asked.

“He was heading home last time I saw him,” Jillian said.

Home meant the *Gathering Storm*. The window for their escape was coming soon. That might have been the reason he’d gone to the ship. Or he might have been avoiding her. She’d pushed him harder than usual last time they’d talked, and she knew he avoided conflict when he could. She’d never have said it aloud, but she wished Amos or Naomi were still with them. Or even Holden. She was always a little worried that she’d break Alex without meaning to.

“I’m out,” she said, then left the shitty bar and the Laconian propaganda channel behind. Everyone else stayed behind to finish their beer and gossip. They could sense she wasn’t looking for company.

She walked through the public corridors of the station, her hands deep in her pockets, her eye on the floor ahead of her. Between her physical size and training almost from the cradle to control the space she occupied, it wasn’t easy for her to back down and look unremarkable. But it was important. They’d already been on Callisto longer than she liked, and she saw that the crew was getting used to it. They were developing favorite shitty bars, favorite brothels, barbers and coffee shops and pachinko parlors. It was normal to fit in after a while. Normal to make a life wherever you found yourself. But it was dangerous for them, because it was also how you became known, and being known too well meant they were all in prison or the pens or the grave.

At the turnoff, she used her hand terminal to unlock the service passage and ducked down into the infrastructure of the shipyard. It was a long walk through poorly heated hallways to the old OPA smugglers’ den. Her footsteps echoed along with the unsteady drip of condensate and the hum of the air recyclers. The graffiti on the walls here was ancient, much of it written in Belter creole or cipher. What little she could make out was

wishing ill on the UN and the MCR. The hatreds of the past seemed almost quaint now. Just being authentic made it better than Laconia.

What are my victories? Will I leave the universe a better place than I found it?

When she was a girl, she'd thought she understood what the future would be. Improvement. Progress. She expected to serve her nation, protect the terraforming effort from the resentful Earth and the feral Belt. She knew from the time she could speak that she wouldn't live to see humanity walking freely on the surface of Mars, but she believed she would die on a world with the spreading green of engineered moss and the aurora of a magnetosphere. The life she'd actually lived was unrecognizably different from the dream she'd had. More astounding, and more disappointing. And her sense of having a place in it was gone. She had her role, first on the *Rocinante*, now on the *Storm*. She had her people and her duty. It was Mars that had changed and darkened. It had metastasized into an empire and a grand project she wanted no part of.

She still had decades in her, if she kept her treatments and exercise regimen up. The universe she died in might still be better than the one she lived in now, but she had a hard time believing it would be better than the one she'd been born into. Too much had been lost, and what wasn't lost was changed beyond her ability to understand it.

Her hand terminal chimed. A message from Jillian, still back at the bar. Bobbie looked at it with distrust. Jillian was a smart woman and a good fighter. Another couple decades of life might eventually convince her to build up her team instead of undermining them. The way she felt at the moment, Bobbie wasn't sure she was in the mood to hear whatever Jillian was about to say. But she was captain, and Jillian was her XO. She thumbed the connection open. The recording had a tag that read **THOUGHT YOU'D WANT TO SEE THIS**. Bobbie started playing it.

The screen from the bar jumped to life. The refresh rate of the image there and the recording made a moiré pattern over the newsfeed host's face, but not so badly that Bobbie couldn't make her out. Or the man in the

window beside her. The old man was gone, and a familiar face had replaced him. Admiral Anton Trejo of the *Tempest*, de facto governor of Sol system.

Bobbie stopped walking.

“—planned for months,” Trejo said.

“So your return to Laconia isn’t related to the events in the ring space?” the host asked.

“Not at all,” Trejo said with a smile. He was about a thousand times better at lying than the host. “But I see how people would come to that conclusion. What happened with Medina was a tragedy, and I mourn the loss of life as deeply as anyone. But I have been assured by the Science Directorate and the high consul himself that the situation is under control. I’m just an old sailor heading for his next post. Nothing more dramatic than that. Vice Admiral Hogan is a good man and ready to take command. I have absolute faith in him.”

A third window opened on the screen, pushing Trejo and the host a little smaller and more masked by the interference. Vice Admiral Hogan was a serious-faced young man in Laconian blue. He could have been Caspar’s older brother.

“Well, speaking for the citizens of Sol system, I’d like to thank you for —”

The recording ended. Bobbie typed up a response with one thumb. THAT’S INTERESTING. She leaned against the wall. Trejo was leaving Sol system. Maybe was already on his way. A new officer—a Laconian officer, not an MCRN veteran—was taking command of the *Tempest*. It might have been enough to convince her, if she hadn’t already decided.

The *Storm* sat on a mobile landing platform wide enough to fit three more like her. The platform’s treads were taller than Bobbie, and designed to roll it through the massive cavern it was hiding in. Half a klick into the darkness, the passage angled up to a concealed hangar on the moon’s surface. For the moment, the ship stood tall as a tower in its gantry crane, the drive cones almost resting on the platform and the top of the ship lost in the shadows above her.

She made her way up the crane to the airlock, climbing the metal ladder hand over hand rather than calling the powered lift. When the airlock cycled open and she stepped in, she disconnected her hand terminal from the Callisto system before she synced up with the *Storm*. It wasn't likely that a dual connection would give them away, but it wasn't impossible, and every unnecessary risk was unnecessary.

The ship told her Alex was in the machine shop, and that four of her crew besides him were in various parts of the ship. All that mattered to her at the moment was that Alex was alone. This wasn't a conversation she needed the others to hear. Not yet, anyway.

The machine shop looked less like the manufacturing workshop that the *Rocinante* had and more like a showroom or a spa. The cabinets were set into gently curving walls, the seams too fine to see. The light came from the walls themselves, the skin of the ship glowing softly and uniformly to make the space gentle and shadowless. Alex stood at one of the benches with a manufacturing printer that looked like it had been grown from a seed more than built. He was thinner about the middle than he'd been when he was married. What was left of his hair had gone white, and a stubble of pale whiskers marked his dark cheeks. He reminded her of the man who'd run the ice cream shop by her school when she'd been a child. He looked up at her and nodded, and the memory faded. He was only Alex again.

"Something broken?" she asked, and pointed to the printer with her chin.

"The center brace on my crash couch was showing some wear. I broke down the old piece and I'm printing up a replacement," he said. "What brings you back to the ship?"

"I was looking for you," she said. "We need to have a conversation."

"I thought we might."

"The things you said before? About why I was . . . reaching for something. You may have been right."

"Thank you."

"But you aren't now," she said. "The situation's changed on us. The calculus shifted when they closed the gates."

“There are still Transport Union ships we could meet with. The gates will open at some point. I mean, they can’t keep them closed forever, I don’t care what happened out there.”

“But until they do, we’re stuck in Sol system. But that’s not the big point. They lost the *Typhoon*. They only had three of these monsters. The *Heart of the Tempest* controlling Sol system because that’s the place with the power and the resources. The population.”

“The history,” Alex said. “It has the story of a time when Laconia wasn’t in charge.”

“That too,” Bobbie said. “The *Eye of the Typhoon* to control the gates. The *Voice of the Whirlwind* back in Laconia protecting their home system. Now they’re down one because of whatever this disaster was. And they’re scrambling. Trejo’s been called back to Laconia. No one’s in control of the ring space. Everything I said before about showing people that the fight is winnable is still true, and if it works we’ll be taking their fleet down to a single battleship. Maybe they’ll keep it in Laconia. Maybe they’ll take it to the ring space if they think whatever that was won’t happen again. They won’t bring it here. Sol system will get a lot easier for the underground to navigate. It’s still the most important system, and we can go a long way toward taking it back. It’s not just a symbolic win anymore. It’s tactical and strategic too. I can’t let the opportunity go.”

“I hear what you’re saying,” Alex said.

The printer ticked to itself for a few seconds.

“I know you have reservations,” Bobbie said. “I respect them. Seriously.”

“No, it’s not that,” Alex began. “I just—”

“I don’t want you in on this if you aren’t certain. No, listen to me. It’s a long shot. The *Tempest* is the deadliest machine humans have ever built. We both know what it stood up to in the war. Even if we do manage to deliver the package, I don’t know for certain that the antimatter will be enough to kill it. You have a kid. And before long, he’s probably going to have a kid. Holden’s gone. Amos is gone. Naomi’s doing her hermit thing. The *Roci*’s

mothballed. And . . . if this doesn't work, the *Storm's* gone too. If you want out, that's not a wrong thing."

"If I want out?"

"If you want to retire. We can get you a fresh name, or do more background for the one you've got. Set you up with a job on Ceres or Ganymede or here. Whatever. You could actually get to know Kit and his wife. No one will think less of you for wanting that."

"I might," Alex said.

"I need you a hundred percent or nothing."

Alex scratched his chin. The printer chimed that its run was finished, but Alex didn't open it to take out the new brace.

"You're speaking as the captain of this ship," he said. "You actually pronounce things a little differently when you're being in charge. You know that? It's subtle, but it's there. Anyway, as the captain, I know what you're saying. And I know why you're saying it. But as my friend, I need a favor from you."

No favors, no compromises, either you're in or you're out popped to her lips.

"What do you need?" she asked.

"Run it by Naomi. If she says it's the wrong thing, listen to her. Hear her out."

Bobbie felt herself pushing back against the idea. The old fight was like a knot in her gut, hard as stone. But . . .

"If she agrees?"

Alex squared his shoulders, lowered his center of gravity, and smiled amiably. No one else on the ship would have recognized the imitation of Amos, but she did.

"Then we go fuck some motherfuckers permanently up," he said.

Interlude: The Dancing Bear

Holden woke up with the light of dawn streaming through the high window and casting shadows across the ceiling. The last trails of a dream—something about crocodiles getting into a water recycler and him and Naomi trying to lure them out with a salt shaker—slipped away. He stretched, yawned, and pulled himself up out of the wide bed with its soft pillows and plush blanket. He took a moment at the foot of the bed to take everything in. The flowers in the vase by the window. The subtle pattern woven into the sheets. He worked his toes against the soft, warm rug. And he recited silently what he always did, every morning since the beginning.

This is your cell. You are in prison. Don't forget.

He smiled contentedly because someone was watching.

His shower was tiled with river stones, smooth and beautiful. The water was always warm, and the soap was scented with sandalwood and lilac. The towels were soft and thick and white as fresh-fallen snow. He shaved in a mirror that was heated to keep condensation from forming on it. His Laconian uniform—real cloth, not recycled paper—was pressed and clean in his footlocker. He dressed himself, humming a light melody he remembered from his childhood because someone was listening.

He had come to Laconia in a much less pleasant cell. He had been questioned in a box. He'd been beaten. And in the early days, threatened with worse things than that. In the later days, tempted with the promise of freedom. Even power. It could have been much, much worse. He had, after all, been part of an attack that had crippled Medina Station and ended with the agents of the underground scattering to systems all around the empire. Someone had even managed to steal one of Laconia's early destroyers out

from under them. Holden had known a lot about how the underground on Medina functioned, who was involved with it, and where they could be found. He was alive and had all his fingers with the nails still attached because he'd also known about the dead space that had appeared on the *Tempest* when it used its magnetic field generator in normal space. And the dead spaces like it in all the systems besides Sol. He was the one person in the whole of humanity who had—escorted by the enslaved remnants of Detective Miller—been inside the alien station and seen the fate of the protomolecule's builders firsthand. And from the first moment they'd allowed it, he'd been shoveling everything he knew about that at them. Calling him cooperative on the subject would have been a vast understatement, and with every passing week, his knowledge of the underground was more out of date. Less useful. They didn't even bother asking him about that stuff anymore.

Duarte was a thoughtful, educated, civilized man and a murderer. He was charming and funny and a little melancholy and, as far as Holden could tell, completely unaware of his own monstrous ambition. Like a religious fanatic, the man really believed that everything he'd done was justified by his goal in doing it. Even when it was the push for his own personal immortality—and then his daughter's—before slamming the door behind them, Duarte managed to cast it as a necessary burden for the good of the species. He was above all else a charming little ratfuck. As Holden grew to respect the man, even to like him, he was careful never to lose sight of the fact that Duarte was a monster.

There was a lock on his door, but he didn't control it. He put the handheld he'd been issued in a pocket, walked out into the courtyard, and closed the door behind him. Anyone who wanted in could go in. If they wanted for some reason to lock him out—or in—they could. He put his hands in his pockets and strolled down a colonnaded walkway. The ferns in the planter came from Earth. Maybe the soil did too. Some minor functionary of the state came out of a doorway before him, turned and breezed by him as if he hadn't been there. He was like a fern that way. Decorative.

The commissary was larger than a whole deck of the *Rocinante*. Pale, vaulted ceilings and an open kitchen with three cooks on duty any time of the day or night. A few tables by the windows, a dozen scattered in another courtyard at the back. Fresh fruit. Fresh eggs. Fresh meats and cheeses and rice. Not too much of any one thing. The elegance came from the labor and deference of the people, not from conspicuous waste. Loyalty valued over wealth. It was amazing what you could learn about someone by sitting quietly for a few months with what they'd built.

He got a carved wooden tray and a plate of rice and fish, the way he usually did. A smaller plate of melon and berries. A light-roast coffee in a white ceramic cup the size of a small soup bowl. Cortázar was sitting alone in an alcove at the back, looking at something on a hand terminal. Out of discipline, Holden grinned and went to sit across from the sociopathic professional vivisectionist.

"Good morning, Doc," he said. "Haven't seen you in a while. Universe treating you gently?"

Cortázar closed whatever file he'd been reading over, but not before Holden caught the phrase *indefinite homeostasis*. He didn't know what it meant exactly, and he couldn't look it up without someone knowing he had.

"Things are fine," Cortázar said, and the glimmer in his eyes meant that was true. Which probably meant they were terrible for someone who wasn't Paolo Cortázar. "Very good."

"Yeah?" Holden said. "What's the good word?"

For a second, Cortázar teetered on the edge of saying something, but he pulled back. It was a confirmation of his good mood. The doctor liked knowing more than the people around him. It gave him a sense of power. The times he was most likely to let his guard down were when he was angry or annoyed. Or drunk. Drunk and complaining Cortázar was the best version of the man.

"Nothing I can talk about," he said, and rose from his place even though his food was only half-eaten. "I'm sorry I can't stay. Schedule."

"If you get time later, track me down and we can play some more chess," Holden said. He lost a lot of chess to Cortázar. He didn't even have

to throw the games. The guy was good. “You will always find me at home.”

Left alone, Holden ate his breakfast in silence and let the atmosphere of the room wash over him. Another of the things he’d learned during his time as a dancing bear was not to search for clues to anything. The effort of the search actually made him overlook things. It was better to be passive and notice what was there. Like the way the cooks spoke to each other, scowling. Like the speed of the dignitaries walking into and out of the commissary, the way their shoulders were tight.

Ever since the most recent event—the weird shift in his perception, the lost time and consciousness—the atmosphere in the State Building had been like this. Something was going on, but Holden didn’t know what. No one had even mentioned it to him. And he didn’t ask. Because someone was always listening.

When he was done, he left his plate to be cleared away, got his usual two cups of fresh coffee in takeaway mugs, and tucked a half link of sausage into his pocket. He walked out toward the gardens. It was a little cool. Seasons were longer on Laconia, but the autumn was definitely starting to get its roots into things. High above, one of the weird jellyfish-looking cloud things sailed through the air, the blue of the sky showing through its transparent flesh. The guard post was little more than a bench with a square-jawed young man who looked like he might have been one of Alex’s cousins.

“Good morning, Fernand,” Holden said. “Brought you a little something.”

The guard smiled and shook his head. “I still can’t accept that from you, sir.”

“I understand,” Holden said. “It’s a shame, you know, because the coffee they serve at the VIP commissary is really good. Fresh beans that they didn’t roast like they were hiding evidence. Water with a little bit of minerals, but not so much that it tastes like you’re drinking a quarry. It’s excellent stuff, but . . .”

“It sounds wonderful, sir.”

Holden put one of the takeaway mugs on the bench. “I’ll just put this here so you can dispose of it safely. And this one that Lieutenant Yao can dispose of too. It has a little sugar in it.”

“I’ll let her know to get rid of it,” the guard said with a smile. It had taken weeks to get that far with the kid. It wasn’t much, but it wasn’t nothing. Every person in the State Building who saw humanity in Holden, who shared a joke with him, or who had a pattern in their day that he could be a part of, made him that tiny bit harder to kill. No one thing he did made a difference. All of it together might decide between mercy or a bullet in the back of his skull somewhere not too far down the line. So Holden chuckled like the guard was a friend and ambled out into the gardens.

There were patterns in the life of the State Building. Everyone had routines, whether they knew it or not. Here at the heart of the empire, with thousands of people making their way into and out of and through the buildings at the source of authority and power, he could have spent lifetimes tracking them all. It was like sitting and watching a termite hive until each insect stopped being itself and turned into an organ in a much larger, older consciousness. If he lived as long as Duarte intended to, he still wouldn’t understand all the subtleties of it. For his present purposes, the smaller patterns were enough. Things like Cortázar enjoyed winning at chess and the guard lieutenant liked sugar in her coffee and Duarte’s daughter went out into the gardens in the late morning, especially when she was upset.

Not that she always did. Some days, Holden put himself in what he hoped would be her path and wound up spending hours reading old adventure novels or watching censor-approved entertainment feeds. Not news. He had access to the state propaganda feeds, but he couldn’t bring himself to watch them. Either they’d make him angry, and he couldn’t afford to be angry, or through simple repetition they’d start to seem true. He couldn’t afford that either.

Today, he picked a little pagoda set by an artificial stream. The plants there were local varieties. The leaflike structures were darker than the plants he’d known growing up. Blue black with whatever chlorophyll analog Laconia’s evolutionary history had come up with. Still wide, to catch

the energy of the sun. Still tall to get above everything they were competing with. Similar pressures yielded similar solutions, just the way flight had evolved five different times on Earth. *Good moves in design space*. That's what Elvi Okoye had called it.

He took out his handheld, and for almost two hours let himself sink into an old murder mystery set on an ice hauler in the Belt before the gates opened, and written by someone who had clearly never been on an ice hauler in their life. The first sign that he wasn't alone was the barking. He put down his reading just as the old Labrador came galloping around the hedge, grinning the way only dogs could. Holden took the sausage out of his pocket and let the dog eat it from his palm while he scratched the old girl's ears. There was no better way to seem trustworthy than to be liked by a dog, and there was no better way to convince a dog to like you than bribery.

"Who's a good dog?" he said. The dog huffed once just as the girl came around. Teresa, the heir apparent. Princess of the empire. She was fourteen, and in the phase of adolescence where every emotion spilled down her face. He barely had to glance at her to know that something had wrecked her.

"Hey," he said, the way he always did. Every time the same, so that the pattern of it became familiar. So that *he* became familiar. Because things that are familiar aren't a threat.

Normally she answered with *Hello*, but today she broke the pattern. She didn't say anything at all, just looked at her dog and avoided Holden's gaze. Her eyes were bloodshot, with dark smudges under them. Her skin was paler than usual. Whatever was going on, it was personal to her. That narrowed the options down.

"You know what's weird," he said. "I saw Dr. Cortázar at breakfast, and he was in a big rush. Normally he'll stop, chew the fat for a little while. Today, he skinned right out of there. Didn't even bother to whip my ass on the chessboard."

"He's busy right now," Teresa said. Her voice was as ruined as she was. "He has a patient. Dr. Okoye. The one from the Science Directorate. Her husband too. She got hurt, and she's here at the State Building so she and

Father can talk. She isn't hurt badly. She'll be fine, but Dr. Cortázar is helping to take care of her."

At the end of the speech, she nodded, like she was reviewing what she'd said and approved of it. It was a small gesture. The kind that would lose her a lot of money if she ever started playing cards.

"I'm sorry to hear that," Holden said. "I hope she gets better."

He didn't ask what had happened. He didn't dig for information. He should have left it at that. From a tactical point of view, anything more was a mistake.

"Hey," he said. "I may not be the guy you want to hear this from, but whatever it is? It's going to be okay."

The girl's eyes went wide, and then they went hard. It didn't take a second.

"I don't know what you're talking about," she said, then turned and stalked away, slapping her palm against her leg to call the dog. The dog looked from her to Holden, regret in the dark-brown eyes. The hope of more sausage weighed against the distress of her person.

"Go," Holden said, nodding at Teresa's retreating back. The dog barked once, a friendly sound, and galloped away again.

Holden tried to go back to his book, but his attention kept wandering. He waited for almost an hour, then put the handheld away and walked. A cool breeze was starting up. He thought about going back to his cell and getting a jacket, but decided not to. Something about being a little uncomfortable was right for the day. Instead, he made his way to the mausoleums.

Garlands of flowers rested in the corner where the stone met the ground. Red and white and a lavish purple. Some were native Laconian plants, some were out of a hydroponics tank. They'd be replaced until the order came to stop replacing them. If the people in authority forgot, there might be fresh flowers at Avasarala's grave forever.

The woman herself looked down at him from where she was etched in stone. It was probably just his imagination, but she seemed amused. Like now that she was dead and not actually responsible for fixing any of the

vast and secret shit show that was human history, she finally got the joke. He looked up at her, remembering her voice, the way she'd moved. Her eyes, bright and intelligent and pitiless as a crow's.

"What is going on here?" he asked, softly. "What am I looking at?"

It didn't matter if they heard that. Without the context of his thoughts, it wouldn't mean anything.

He was seeing Teresa, devastated. The State Building vibrating with banked anxiety. Cortázar—entitled, narcissistic, protomolecule-obsessed Cortázar—quietly gleeful. Another bout of strange consciousness and lost time, this one at least in Laconia system, and maybe beyond. Elvi Okoye's return being used as a cover story for Cortázar's presence at the State Building. Because he needed to be there, was happy to be there, and someone wanted to hide the real reasons why.

Put like that, something had happened to Duarte.

If it was true, Cortázar's hands were freer. Which meant his plans to vivisect and kill Duarte's daughter would probably kick into high gear. And also Elvi was back from her missions in the other system, so Holden's plans could move forward too. It was a race now, and he had a strong suspicion that he was behind. That was too bad. He had hoped to have more time.

Don't be a whiny little cunt, Avasarala said in his imagination. Hope in one hand and shit in the other. See which one fills up first. Get to work.

First he chuckled, and then he sighed. "Fair point," he said to the dead woman. This time she didn't answer. He turned and walked back toward the buildings as the first genuinely cold rush of air came and stirred the ground cover that wasn't quite grass. There would be a storm by nightfall, he was sure of it. Maybe snow. Snow was the same everywhere.

He had to find his next step. Maybe Elvi. Maybe her husband, Fayeze. He'd always liked Fayeze. Maybe Teresa. Maybe it was time to go to Duarte, if it wasn't already too late. If only there had been more time . . .

This was the problem with thousand-year Reichs. They came and they went like fireflies.

Chapter Twenty-Five: Naomi

Naomi had lived long enough to see history change more than once now. In the reality where she'd been born, Earth and Mars had maintained an alliance built to keep their boot permanently on the neck of Belters like her. The idea of alien life had been something for scientific speculations and thrillers on entertainment feeds. Some changes had been so slow it was almost possible to miss that they were happening. The change of Belter identity from underclass to the de facto governing party at the height of the Transport Union's power had spanned decades. The rebuilding of Ganymede after its collapse also. The others had been sudden, or had seemed that way. When Eros moved. When the gates opened. When the rocks fell on Earth. When Laconia came back.

The sudden changes, as different as they were, all followed the same pattern. After it happened—whatever it was—humanity went into a kind of shock. Not just her and the people around her, but the whole vast and varied tribe of people. For a moment, it was as if they were all still primates on the fields of Africa going silent at a lion's roar. All the rules they'd lived by were suddenly open to question. *The inner planets have always been my enemy, but are they still? The far reaches of the solar system are as distant as humanity will ever be, but can we go farther? Earth will endure, won't it?*

Naomi didn't like the feeling, but she recognized it. And more than that, she saw the power in it. Moments like these were opportunities. They could bring new alliances, new empathy, a new and broader sense of being together in a single human tribe. Or they could be the poison that ran

through human minds for decades to come and welcomed ancient wars onto new and bloody battlefields.

Auberon held its breath and waited to see if the predators were coming for it. She saw it on the in-system newsfeeds that were the only newsfeeds now. It was in the wideness of the Laconian governor's eyes. And, Naomi had to admit, it was in her own heart too.

The *Typhoon* was the absolute symbol of Laconian dominance. After the *Tempest's* inexorable conquest of Sol system, Laconian rule was a given. It wasn't just that Laconia had found a way to defend the ring space against simultaneous attacks from any or all gates, though that was part of it. It was also the clear knowledge that by being in the slow zone, the *Typhoon* was already halfway to anyone's home. That once it started coming, nothing could stop it but the whim of the empire.

And now it was gone.

Medina Station had been a feature of the ring space from the start. It had been one of the first ships through the Sol ring, and taken up its place even before the other gates had opened. Medina had been the farthest trading post of the new land rush and then the traffic cop at the center of the colony worlds. Its history as a religious generation ship and then as a battleship for the OPA had made it as rich and complicated as the people who lived on it. It was a permanent fact of how humanity moved through the rings, as constant and permanent as the rings themselves.

It was gone too.

If it had been just one or the other, maybe it would have been simpler. But having the hammer that had threatened every head in the empire and the longest-standing human presence at the gates both wiped away at once pulled Naomi's heart in two directions. She was rejoicing and mourning at the same time. And also feeling the deep unease that came from the reminder that that being familiar wasn't the same as being understood.

"How do you take your eggs?" Chava asked.

Naomi, sitting at the breakfast bar, rubbed the sleep from her eyes. "Usually reconstituted and from a nozzle."

"So . . . scrambled?"

“That would be great.”

Chava’s rooms were in a fashionable part of the station, assuming there was an unfashionable part. Auberon hadn’t existed long enough to have history built in its bones yet. Nothing there had been reappropriated or reused or reimagined yet. The hard industrial white of Chava’s kitchen was exactly as the designer had imagined it. The ferns in the hydroponic vases that showed the white of their roots and the green of their fronds were placed exactly where they would photograph best. The windows looking out over the common space three levels below as if it were a city apartment on Earth, except cleaner, had the intended effect. In a generation or four, it would develop its own style and character, but it hadn’t yet.

Or maybe Naomi just needed to get some coffee and work out. That was possible too.

“Did you sleep well?” Chava asked over the sizzle and pop of eggs on their hot pan. “I don’t usually have visitors. You’re the first one to be in the guest room for more than a night.”

“It’s lovely,” Naomi said. “Is there any news?”

Chava put a white ceramic coffee cup on the bar next to Naomi’s elbow and then a small glass French press already filled with black coffee beside it. “The political officer at the transfer station is saying all traffic out of the gate is prohibited until we’ve had instructions from Laconia. Which is tricky because the repeaters are still down. There’s a freighter that was on its way out when the shit hit the fan, and the Transport Union is saying that if it doesn’t get its cargo to Farhome system, there’ll be a lot of starving people a year from now.”

Naomi poured the coffee into the cup. Black welled up in the overwhelming white, steam rising up from it. The smell was lighter than she was used to. She wondered if Jim would have liked it.

“Any word from the governor?”

“Radio silence,” Chava said. “There are stories that the governor’s been taking payoffs for a long time. His loyalties aren’t perfectly clear.”

“That’s weirdly refreshing,” Naomi said. The coffee tasted better than it smelled. Another layer of sleep that she hadn’t recognized slipped away.

The smell of the eggs started to seem very interesting.

Chava saw it and smiled. “Hungry?”

“I think I am,” Naomi said. “The local underground. How does it look? What kind of resources does it have?”

Chava shrugged. “I don’t entirely know. Saba keeps us compartmentalized. I’m not even sure how much he knows, except that he knows who to ask if something’s possible.” She realized the error in what she’d said, and her lips pressed thin. “Knew, I mean. I can’t quite believe he’s . . .”

“I know,” Naomi said. “Without coordination, we’re not really an underground anymore. We’re thirteen hundred different undergrounds that can’t talk to each other.” Communication, she thought as she sipped her coffee, was always a problem.

Chava swirled the pan of eggs and decanted the fluffy yellow clouds onto a white plate. “On the upside, there are thirteen hundred different Laconias now. Less than that, really. A lot of the smaller colonies don’t have governors on-site yet. They’re essentially free.”

“And in danger of collapsing without support. I’m not sure dying free is as attractive when it stops being rhetorical.”

“Truth,” Chava said.

The eggs tasted strange. Thicker and more substantial than the approximation that the *Roci* had put out, and with a different aftertaste that Naomi couldn’t decide at first whether she liked or not. Having food in her stomach felt wonderful, though. And it went well with the coffee.

Chava hadn’t brought up the subject of Naomi’s future. They both knew that there were too many unknowns now for any plan to mean much. Even if there was a ship that could take in the shell game, there was no Saba to send her information to analyze or consider her recommendations. Naomi’s role in the underground, the underground’s ability to survive, everything was radically uncertain. They papered over the gaps with hospitality and kindness. Naomi was Chava’s guest. Slept in her spare room. Ate her food and drank her coffee as if they were sisters.

It was strange to think that people lived like this. Not just citizens either. People in the underground had nice apartments and windows with carefully sculpted views, fresh fruit, and coffee. It was so exaggeratedly normal that it felt like the bait in a trap. Would Chava be able to walk away from it all the way Naomi had left the *Roci* and Alex and Bobbie? Or would the comfort keep her here too long if something went wrong? If something had already gone wrong?

“Problem?” Chava asked, and Naomi realized she’d been scowling.

“I was thinking about . . .”—she reached for something less rude than *my instinctive disapproval of your lifestyle*—“traffic control in the ring space. If that freighter does make the transit, it’ll be going through blind. They all will be.” Now that she was saying it out loud, it actually did worry her. “And there’s going to be pressure. All of those colonies that aren’t quite self-sustaining yet? They may wait for a while. Hold back, but sooner or later, the risk of making the transit is going to be better than the certainty of having their colony fail.”

“That’s true,” Chava said as she cracked another egg into the pan. “But I can’t see rebuilding in the ring space either. Not before we know what happened and whether there’s a way to keep it from happening again. Can you? I mean, maybe Laconia will send another one of its system-killer ships through and park it there again, but only if they’re up for the risk of losing it.”

“It does start looking like hazard pay,” Naomi said, trying levity. It didn’t feel right, though. Not yet.

“Once could mean anything,” Chava said as the new egg started to bubble and pulse from the heat. “Maybe it was just the one time. Or maybe it’s every thousand years. Or every third Thursday from now on. We don’t even know what triggered it this time.”

“By the time we have enough points to make a good scatter plot, it’s a lot of dead ships.”

“If there’s even a way to know when a ship went dutchman. There’s no one watching, so who’d be keeping track? The whole communications grid

is down at this point. If someone did know, they'd have to build some way to tell us. No one's in charge. Do you want some more coffee?"

"No, thank you," Naomi said, her mind already racing along somewhere new.

She and Chava weren't the only ones having this conversation. Thousands of other people in Auberon were thinking about these same things in restaurants and bars and on ships traveling through the vast emptiness between this sun and gate. It was how the shock started to wear off. How the moment after the moment created itself.

And it wasn't only Auberon either. Every system with a ring gate was looking at the same questions, fearing the same possible futures. Every system including Laconia.

The thought landed with a weight. Her grief at the loss of Saba and Medina and her unexpected hope in seeing the *Typhoon* destroyed. The dread of the mysterious enemy and its escalating body count. They all led to the same conclusion.

It was like a nightmare where you spent the whole night running from something and ended up in its lap all the same. *No one's in charge.*

"Sorry?" Chava said as she slid her own egg with its golden yolk onto a plate. "Did you say something?"

"We're going to need to break some protocols," Naomi said. "And I'll need access to a machine shop. You wouldn't know how I could get my hands on some torpedoes, do you? I don't need warheads. Just the drives and the frames. Long-range designs, if we can find them."

"I can look," Chava said. "How many do you need?"

"Ideally about thirteen or fourteen hundred."

Chava laughed, saw Naomi's expression, and sobered.

"And," Naomi said, "if the offer's still open, I might take the coffee after all."

The yard that Chava found would have been small back in Sol system. There were thousands like it scattered through the Belt. Improvised shipyards that catered to rock hoppers and independents who couldn't afford docking fees at Callisto or Ceres or any of the other centers. Apart from the fact that this one didn't have anything manufactured over fifteen years ago, it could have been anywhere.

The man who ran it was called Zep, and he had a faded split-circle tattoo on his neck. He spoke English, Mandarin, Portuguese, and a dialect of Belter creole that put his background in the Martian trojans. He gave her the tour of the yard. It was a high, pale bubble of ceramic and steel with harsh white work lights overhead and a misting of oil every morning to trap the lunar fines. Everything there was a little sticky to the touch and stank of gunpowder. It was the first place in Auberon system she felt even slightly at home.

Even with the oil, the fines—tiny bits of stone smaller than dust that erosion had never smoothed—were dangerous enough that she wore a mask and eye protection. She went through the rows of decommissioned ships that had been repossessed or damaged by misadventure or malice to the point that it made more sense to sell them as scrap. They were mostly orbital shuttles and semiautomated prospectors. The shuttles were no use to her, but some of the prospectors had probes. They didn't have the range or speed of real torpedoes, but she could start with them. Over the course of a long, sweat-soaked morning, she'd assembled half a dozen that seemed worth closer examination.

The idea wasn't that different from the bottles she'd used before. It was only the scale that was different. And the stakes. She could load transmitters and explosives into the probes and then send them out through the different gates. No one would be exposed to danger by coming through the newly haunted slow zone, and the messages would be untraceable. Anyone listening as she had been would hear them just like the ones she'd dropped off before. She needed to work on the exact wording. It would be the first voice from the underground since Medina. Getting it right mattered. Getting it done quickly mattered more.

There had been a moment in the neo-noir films that Alex always watched that happened so often it became a cliché. She had to have seen it a dozen times over the years, and she hadn't been paying much attention. A firefight would start with operatic choreography and impossibly high-capacity magazines. The hero and the villain would play through the scenario with whatever peculiar flourishes the director had invented to make this one different from all the ones before. Then, at the climactic ending, the two enemies faced each other, and both would run out of ammunition. The resolution of all the heroic violence came down to which of them could reload faster.

That was where the underground and the empire stood. They were both disrupted. Whichever of them was able to organize again first would survive. Laconia still had the firepower. It still had the technological edge. But if the underground could rebuild a communication grid faster, she could change the story of their inevitability. Laconia's advantages wouldn't be enough.

Speed mattered. If Saba were still alive, if Medina had survived, it would have been time for him to stand up, announce himself, and become the public face of the opposition. To forge the thirteen hundred different undergrounds that were out there now in the cut off systems back into one thing, and exploit the confusion of the enemy before Duarte could find his feet. Take the crisis and make it a turning point, even if it meant more pressure on Drummer and the Union. Naomi would have told him it had to be done. She'd have been right.

Her hand terminal chimed. She pulled off her goggles and air filter and accepted the connection. There was only one person it could be. Chava was in her office, her hair perfectly in place, her blouse unsmeared and her demeanor as polite and professional as if she did work like this every day.

"I have the secure connection you asked for," she said. "The light delay won't make it a conversation."

"How far?" Naomi asked.

"About fifty minutes, one way."

Naomi pictured the Auberon system. Its three gas giants the greater and lesser belts. The *Bhikaji Cama* was still a fair distance from the ring. She had time.

“Thank you,” she said.

“Not a problem,” Chava said. “I’m sending you the route and encryption. I’ll see you for dinner tonight?”

“I don’t want to impose.”

“It isn’t an imposition,” Chava said. “And it’s safer than anyplace else.”

“Then yes, thank you,” Naomi said. Chava smiled and killed the connection. Naomi thumbed up the data packet configuration and slotted in the information she’d been given. If it worked, it would slide unnoticed through the Transport Union’s system and appear to Emma Zomorodi in particular.

Naomi considered herself in the preview display. Dust and sweat-smeared skin. Hair more pale than black. Wrinkles at her eyes and mouth. This was the woman who turned down High Consul Winston Duarte’s invitation to live the rest of her life in a palace with the man she loved in order to take on the one job she never wanted. She smiled, and the woman on the screen looked happy. Exhausted, yes. Well bruised by life, yes. But happy. She started the recording.

“Emma, I need to ask you to break protocol for me. I want you to send me everything you know about the status and function of the underground. Contacts. Ship names. Procedures. Anything you have, tell me. And if you can get messages to your operatives, tell them to expect a message like this from me in the near future.

“I know it’s exactly what I told you never to do before, but the situation has changed. Medina is off the board, and we’ve lost Saba. We have to regroup, reorganize. And someone has to take initiative.”

A thick trickle of sweat broke free from her temple and began its slow fall down toward her eyebrow. She wiped it away, pulling her hair back from her eyes.

“Until you hear otherwise from me, I will be running the underground.”

Chapter Twenty-Six: Elvi

Elvi woke herself trying to scream. She didn't remember the dream, just the sense of overwhelming fear and paralysis. The effort to make herself heard that seemed to go on for hours, even though all it managed was a little groan, loud enough to bring her back to consciousness. It left her in the darkness, drenched in sweat and grateful for another few sleepless hours.

The suite was courtesy of the Laconian state. Two beds, both with autodocs built into them. One for her, the other for Fayez, who, fortunately, was still breathing deeply and heavily. She knew without looking that she hadn't woken him up. She was grateful for that too. She didn't turn the light on. Her cane was at her bedside, and she found it easily enough. She levered herself to the edge of the mattress, steeled herself, and swung her legs over. It hurt like hell, but only for a few seconds. Standing up was actually better, and she was leaning on the cane less than she had been.

The night terrors were looking pretty robust, though.

Trying hard not to make enough noise to wake her husband, she went through the darkness to the closet. The servants had left robes for them both, thick, textured cotton with a lining of something that might have been silk. She pulled it on one sleeve at a time, cinched it closed, and made her way out to the courtyard and a stone bench carved with complex mathematical patterns like something out of a mosque.

Her memory of the rescue was spotty at best. She remembered giving the emergency evacuation order to the *Falcon*. She remembered coming back to consciousness in normal space and calling for help. Crawling through blood and crash couch gel to Fayez. That part was pretty clear.

After that, a few lucid moments of trying to cinch a belt around Fayez's calf as a tourniquet. At some point, she'd decided that she was losing too much blood, slipped her hand into the hole in her leg, and made a fist in there to apply pressure all around. That probably should have been the worst part—her wrist vanishing into the skin of her own leg like a graphics processing failure. What she actually felt at the time was pride at having come up with a graceful solution. The tourniquet had been hard.

They told her she had been conscious when the rescue ship came, but she didn't remember it. She knew because she'd read the reports that Jen had lived and was being treated somewhere else in the city. That Admiral Sagale had died, half his head ripped away. That Travon was technically listed as missing, since it was possible he could have survived someplace without the arm he left behind.

The casualties among the rest of the crew were similar. About half had survived. No one had come through uninjured. The *Falcon* had been stabilized too and brought home to be healed. And studied.

Some local animal was making its call. Four distinct notes, repeated again and again, at different speeds. Mating call. Warning. Alerting the hive to a food source. She had no way to know, but it was pretty. The night air was cool almost to the point of discomfort, but she didn't want to go back inside for a coat. She'd just wait until she got tired and head back to bed or else find some other lobby in the palatial buildings to sit in until dawn broke. If anyone wondered why there was a lady with a bathrobe and a cane wandering around, she'd just tell them it was classified.

Exobiology wasn't medicine. She knew more about predictive parallel evolution models than she did about wound care. If she hadn't had a rank in the Science Directorate, she wouldn't have been able to see her medical records, and mostly for good reasons. It was dangerous for someone with one expertise to try to interpret something in a different but similar field. Laypeople didn't understand how much scientific literature was about nuance and shared understanding. Even with expert systems to help, she was more likely to avoid errors with one of Jen Lively's physics analyses

than her own medical records, if only because she knew that she didn't know physics.

But she'd looked anyway.

The medical team had fought hard to keep her and Fayeze alive. The cuts where their flesh had gone missing were strange. Something about the wounds had made clotting weird too, which of course immediately left her thinking of vampire bats and leeches. Organisms that fed on blood and produced anticoagulants. Which there was no reason to think these attackers had. The incisions in the decking had the same too-perfect margins.

A more comprehensive report was still in draft form, but she was able to access that too. Sagale appeared to have died instantly. Others in the crew had lived long enough for the wounded *Falcon* to haul them through the gate and out of danger, only to bleed out or succumb to shock. The missing matter was just that. Missing. The scoop of her leg, Fayeze's foot. Most of one lobe of Sagale's brain. All of Travon but his arm. It wasn't that they had been torn away. They'd been excised and taken . . . elsewhere. All told, the *Falcon* had lost 12 percent of its mass, apparently at random. The dark things that moved between the spaces hadn't been targeting the crew. They'd meant to take everything. The human parts they'd removed were just points along a path. It almost made them worse. At least murderers had motives.

She pulled aside the robe and looked at the wound. The medical gel that filled in the missing flesh was pale, but getting pinker. She could already trace the lines where blood vessels were starting to form. Muscle and skin would follow over the next few weeks and months. In the end, she'd probably have a slightly discolored patch on her leg where the skin was younger than she was. Sagale, on the other hand . . . She shuddered. It was still hard to accept that he was gone.

She didn't notice the dawn starting. The courtyard didn't open to the east, so it was just a slow, subtle graying of the Laconian sky. The retreat of the stars and glowing construction platforms. Even then, what she noticed was the local organisms getting louder and the gentle vinegary smell that one of the local bird analogs made when it was waking up during mating

season. She was cold and stiff and uncomfortable, but she didn't move until Kelly, Duarte's personal attendant, appeared.

"Major Okoye," Kelly said. "You're up early."

"Or late," Elvi said, trying on a smile. It didn't really fit.

"Admiral Trejo arrived from Sol system last night."

"That was fast."

"I understand the burn was punishing. Still, he asked if you could join us after breakfast."

"I can," Elvi said. "But the one I need to talk to is the high consul."

Kelly's smile revealed nothing. "That's worth discussing with the admiral."

Elvi had had only ever seen Anton Trejo on screens. In person, he was a little underwhelming at first, and then, after a few minutes, she understood how he'd become the most decorated man in the Laconian military. He was stocky. His hair was dark and thin enough she could see pretty much all of his scalp through it. His eyes were a vivid green. A few years back, he'd conquered all of human civilization in less than a month. His manner was gentle, like everyone but him was a little fragile and he didn't want to break them unintentionally.

He didn't come across as having much to prove.

The meeting room was casual. Tapestry-upholstered couches and a low, long table of polished stone. The others were all men. Colonel Ilich, who Elvi had met a few times when she'd first been pressed into the Laconian military, Kelly who had brought her, and her immediate superior, Paolo Cortázar, who headed the Science Directorate and coordinated pretty much all the research Laconia did. Winston Duarte wasn't there.

"Thank you for joining us, Doctor," Trejo said as she took a seat across from him. "I read the reports on the incident in the ring space. That's some hairy shit there."

She took the casual profanity as a sign of his respect. He was treating her as a peer.

"It was," she said. "I'm hoping not to do that again."

"We'll try to keep it that way. I was a little anxious making the transit myself. I mean, I wasn't awake for it. I heard you were awake in one of these new full immersion couches? I don't think I'd enjoy that. I don't like going over twenty g asleep, much less watching it happen."

"I'm glad you made it," Elvi said. Cortázar shrugged and looked at his fingernails. Performative boredom. He wasn't happy she was there. With a little taste of spite, she found a way to draw the pleasantries out a little more. "I hope there wasn't any trouble for you?"

"No, no," Trejo said. "I was fine. There are problems, though. People are starting to make their own transits. One poor bastard out of Bellerophon tried to speed through. Transit into ring space and transit back out in the same burn. He hadn't heard about how the gates all shifted position a little. His ship hit the edge of the gate hub about three hundred clicks to the left of the gate he was aiming for."

"Ouch," Elvi said.

"People are getting desperate. For every system that can sustain itself, there's dozens that aren't there yet. Trade isn't optional for them. It's life and death. And without a traffic authority, death comes a lot more often."

"I'm sorry about Medina and the *Typhoon*," Elvi said.

"Admiral Song was a good sailor," Trejo said. "Died with her boots on. That's as much as any of us can ask. But there'll be time enough to toast the dead later. I have a problem, Doctor. And I have chosen to make part of my problem your problem too."

Cortázar sighed and looked away. Trejo explained what had happened to the high consul, then asked Kelly to bring them some tea while Elvi got over the shock. It was green tea, poured from a cast-iron kettle into black ceramic mugs. She'd had two servings before she felt like she'd found her feet again.

"So there's no one running the empire," she said.

“We are running the empire on the high consul’s behalf until such time as he is sufficiently recovered to take over the duties himself,” Trejo said, then paused and added, “or his daughter has reached an age sufficient to take over in his place.”

“She’s very bright,” Colonel Ilich said. “And she’s controllable. The high consul believed, and I agree, that the narrative of succession had to be familiar and reassuring. Primogeniture is a common model across a wide band of cultures and backgrounds. Of course, she won’t be expected to actually wield power until she has shown an aptitude and willingness.”

“How old is she?” Elvi asked.

“Duarte hoped he’d have a couple centuries to train her up,” Trejo said. “Hell, he hoped she could stay on the bench forever. But these are the cards we have, and so we’re going to play them. I’m not going to sugarcoat this. We’ve got a lot to carry, and most of that is going to fall on the Science Directorate.”

“How can I help?” Elvi asked. It sounded better than *What the fuck do you want me to do about this?*

“Your top mission is to get the high consul back,” Trejo said. “Dr. Cortázar will walk you through everything he’s done so far. We’re hoping a pair of fresh eyes will find something he hasn’t.”

Elvi looked over at Cortázar. He wasn’t looking at her. So this was why he was pouting. Trejo had called his competence into question. That was going to be unpleasant.

“While you do that, I’m going to be getting things back under control,” Trejo said. “The *Voice of the Whirlwind*’s still a few weeks shy of her shakedown, but we’re not stationing any crewed vessel in the ring space, and we’re keeping the transits short. *Whirlwind*’s going to be protecting Laconia. *Tempest* is staying in Sol. There’s a situation there that needs an eye on it, and Sol’s the most unruly system we have to worry about.”

“And the traffic control?” Elvi asked.

“We can’t hold the inside of gates,” Trejo said. “So we’re going to have to take the outsides. We have two hundred and eighty *Pulsar*-class destroyers to police thirteen hundred and seventy-one gates.”

For a moment, Elvi saw the enormity of what Trejo was facing press down on him. The bright-green eyes focused on nothing, and the cheerful, confident face only looked tired. But a moment later, he was back.

“I’ll be deploying those to systems most likely to have high traffic. We’ll get the comms network back. And after the *Whirlwind*’s ready, we’re turning all the construction platforms over to generating more antimatter charges. That brings us to your number two priority. I think we can all agree this tit-for-tat see-if-we-can-be-reasonable plan hasn’t gone so well. We’re going to gear up to fight this war for real. Anything you can find that will give us an—”

Adrenaline flooded Elvi’s bloodstream. Her heart hit her ribs like a hammer. “Are you fucking crazy?”

Ilich and Kelly shared a look as if she’d confirmed something. Cortázar sneered.

“I’m sorry,” Elvi said. “Wait. No. I’m actually not. Are you fucking crazy? Did you not see what just happened?”

Trejo bowed his head. His scalp glimmered at her through his sparse hair.

“I understand that this is a hard conversation for you right now, Doctor. You’ve been through a lot. But I’m a military man, and the fact is that we are at war. We have been at war since the first time a ship failed a transit.”

“Those things killed—”

“I know what they did.” Trejo’s voice was harsh. It pushed her back into her seat. “And I know *why* they did it. Because they got hurt. That means they can *be* hurt, and unless they find some way to sue for peace, I intend to prepare our forces to hurt them again. Candidly, I don’t like it. We’re going up against something we don’t understand with unfamiliar tools on a battlefield whose constraints we’re working out as we go along. It’s a stupid war, but it’s ours. If it can be won, I intend to win it. You’re going to help me.”

A hundred objections rose in her mind, but fell back at the sight of the bright-green eyes.

“Yes, sir,” she said.

“Good. Please begin your review with Dr. Cortázar and keep me apprised of any insights or progress.”

I will Elvi said at the same moment that Cortázar said *We will*. Trejo accepted the answers as if they’d been the same. When he spoke, he spoke to Elvi. “If you disapprove of my plan of action, it’s easy to stop me. Just get me my boss back.”

“I’m going to try,” Elvi said.

Elvi walked back to her rooms before she left the State Building for the Science Directorate. She wanted to clear her head, but it wasn’t clearing. Every thought she had seemed to fight its way to consciousness like it was swimming through gel. Her leg ached worse now, and the sleepless hours were starting to weigh on her, pulling her toward bed now that she had obligations. Or maybe she was just realizing that her time of healing after the trauma was over, and she wasn’t remotely okay.

The grounds were beautiful. Better than the best luxury resort. The weird leathery fliers they called sunbirds were out, flapping high above the buildings and looking more like bats than birds. Something like a dragonfly zoomed past her, wings buzzing here both the same as and entirely differently than they would have on earth.

The scale of it all was too big. There were too many billion people in too many hundred solar systems for anyone to really understand. For any human to really understand. Maybe that was why Winston Duarte had decided not to be human anymore. Him or his daughter either. It made her wish she’d majored in mathematics instead. They hadn’t sent any mathematicians to Ilus. And without Ilus, she wouldn’t have been the nearest thing to an expert on the wounds in reality that those dark things left. And she wouldn’t have been recruited by Laconia. And she wouldn’t be here. One little change early on could have meant a whole different life.

She turned the last corner before her courtyard, and there, out in the gardens, Fayez sat. One leg ended in a bright blue pod the size of a boot

where his missing foot was already starting to grow back. The other was stretched out on a bench. And leaning against the back of the bench, James Holden.

As if he had felt the pressure of her gaze, Holden looked up and waved. He seemed both older and as though he hadn't changed at all. She started toward the bench, leaning more on her cane than she'd had to before. The gel in her leg felt like it was burning. Hours more standing and walking through Cortázar's labs sounded awful.

As she approached, Holden and Faye exchanged a few words, and Holden walked off briskly. By the time she got to her husband's side, Holden had disappeared behind a hedge.

Faye moved his good leg and gave her room to sit. There were dark pouches under his eyes, but his smile was as amused and sardonic as the day she'd met him. Or the day she'd married him. Or that one time when they'd almost died because a terrorist had booby-trapped a landing pad.

"I think I must have lived my life wrong somehow," she said.

"I know the feeling," he said. "But then I see you, and I think something must have gone right. Even if everything else treats me like my previous incarnation killed a priest."

She took his hand, wove her fingers with his. The future looked a little less bleak.

"I just had the most interesting conversation," Faye said.

"I could say the same," she said. "But mine's classified, so why don't you go first."

"Well, he was being awfully cagey. But I think our old friend Holden just told me Cortázar's plotting murder."

Chapter Twenty-Seven: Teresa

Nothing was the same anymore. She tried to pretend that it was. That her father was only sick, the way normal fathers were sometimes. She woke up in the morning, and Muskrat was there. She walked through the gardens and the State Building the way she always had. Everyone she saw treated her just the same, except Ilich, who knew the truth.

She assumed that everyone thought her father was in deep consultations with the best minds of the empire because of what happened to the *Typhoon*. They had faith in him. He was Laconia. She thought the guards stood a little taller when she walked by. That the cooks at the commissary saved the best dishes for her. It wasn't because she deserved them. It was because she was the closest thing they could get to him, and they wanted to make their offerings. They were scared by what they'd seen. She was too. But they had a story where everything would be all right, and she didn't.

The closest thing she had was Ilich, and he was gone now more than he was with her. When he did see her, the only lessons they did were the new rules. Don't tell anyone about the high consul. Don't act frightened. Don't leave the grounds of the State Building.

She tried watching her favorite films and newsfeeds, but they didn't hold her attention. She tried reading her favorite books, but the words all slid off her mind. She tried running the length of the security wall as fast as she could for as long as she could until the pain and exhaustion made it impossible to think or feel anything. It was as close as she came to peace.

And in the afternoons and early evenings, she went and sat with her father. He suffered Kelly to bathe and dress him, so whenever she came he looked trim and neat. She sat beside him at his desk and used his displays to

go over simple mathematical proofs or the diagrams of ancient battles. Sometimes he would nod at the images, as if deep in thought. Sometimes he would pat at the air around her head like he saw something there.

She found herself really looking at him. Staring. His cheeks were rough from old acne scars. His hair was a little thin at the temples. The skin at his jaw was soft with age. And there were other things. The opalescence that sometimes made his skin shine like mother-of-pearl and other times nearly vanished. The darkness in his eyes, like storm clouds.

The more she looked, the less he seemed like her father—the great man who strode the universe and her personal life with the confidence of a god—and the more he seemed like . . . just someone. The worst times were when he looked sad. Or frightened. He didn't particularly notice when she cried.

Ilich did what he could.

"I'm sorry I haven't been as available since . . . Well. Since."

They were sitting at the fountain where he'd taught her about displacement. How to make something heavier than water float by making it hollow. She looked at the rippling surface of the water and wondered whether she'd float now too.

"It's all right," she said. "I understand."

His skin looked ashy. His eyes were watery with exhaustion and stress. His smile was the same as it had ever been. She'd thought before it was because he wasn't afraid of her. Now it just seemed well practiced.

"This may not help," he said, "but part of what you're feeling right now is normal. There's a moment that everyone eventually experiences when they see that their parents are just people. That these mythic figures in their lives are also struggling and guessing. Doing their best without knowing for certain what their best is."

The anger in Teresa's chest was the first warm thing she'd felt in days.

"My father is the ruler of the human race," she said.

Ilich chuckled. Had he always chuckled exactly that same way, and she was only noticing it now? "That does change some aspects of it, yes. But I don't want you to feel alone."

Have you considered not making me alone? she didn't say. *Or is it just the feeling that matters?*

"I know it's hard, having this secret," he said. "The only reason we're doing this is that your father and you are so important."

"I understand," she said, and pictured what he would look like if she drowned him in the fountain. "I'll be okay."

She didn't sleep that night. The anger that had surprised her so much in Elsa Singh had infected her. As soon as she put her head on her pillow and closed her eyes, she was in a shouting match with Ilich. Or with Cortázar. Or with James Holden. Or with her father. Or Connor. Or Muriel. Or God. Even when she drifted just a little bit away from herself, she woke up minutes later with her back teeth aching from being clenched together. *Seriously? You're one of the angriest people I know, Tiny,* Timothy said in her memory. Now it felt true.

After midnight, she gave up. Muskrat thumped her tail against the floor twice.

"What are you so fucking happy about?" Teresa snapped.

Muskrat stopped wagging, and her gray canine eyebrows rose in an expression of concern. Teresa turned on the state news-feed and watched one of the professional voices of Laconia make reassuring mouth noises. *The repair of the gate repeaters is already underway, and the communications network should be restored in a matter of weeks. Normal trade between worlds will resume very soon after that. Until then, the high consul is determining which supply ships are critical to the empire and approving transits on a case-by-case basis. The tragedy in the ring space which claimed the lives of so many loyal to the Laconian dream has shown no signs of recurring, according to the Science Directorate.* Lies, half-truths, fictions, and bullshit.

Rage and grief fought in her heart, and behind them, looming larger than the sky, a sense of overwhelming betrayal that she couldn't put a name to.

Muskrat chuffed once in concern. Teresa bared her teeth in a grin. "I'm not allowed to tell the truth. I'm not allowed to feel anything. I'm not

allowed to leave the compound,” she said. “I can’t do anything. You know why? Because I’m so *important*.”

Teresa got up, stalked to her window, and opened it. Muskrat looked away nervously.

“Well?” Teresa said. “Are you coming or not?”

She had never been to the field outside the compound at night. In the darkness, it seemed larger. Swarms of tiny insectile animals crawling along the ground glowed in patterns of moving stripes as she walked past, like her footsteps were making dry ripples on the ground. A cold breeze hissed through the bare trees. In the distance, something called out, its voice like a flute. Two others answered, farther away. A smell like pepper and vanilla hung in the breeze. Ilich had told her once that the chemistry of Laconia was so different from the one humans had evolved with that people struggled to make sense of it, inventing smells that weren’t really there out of confusion. She had grown up here, though, and it seemed perfectly normal to her.

Muskrat trotted along at her side, glancing up every few steps as if to ask, *Are you sure about this?* Teresa knew the way to the mountain like it was the back of her hand. She didn’t worry at all about straying from the trail.

In her imagination, Ilich sputtered and scolded. He told her that the rules existed for good reasons. For her safety. That she couldn’t just go and do whatever she wanted, whenever she wanted. He’d know she was gone. That she’d ignored his rules. That was part of what made it worth doing. What could he do? Lock her in her room? When her father came back to himself, Ilich would have to answer for everything he’d done in the meantime. Her father had known she went off the compound. If he hadn’t stopped her, Ilich wouldn’t dare. He’d only make rules he couldn’t enforce. A law without consequences wasn’t a law. It wasn’t anything.

The first sign she was close was a shifting in the hedges and the bulbous false eyes of the repair drones peering apologetically out at her. They made their series of three falling clicks, an obvious query for which she didn't have time or an answer. Muskrat usually barked and tried to play with the drones, but tonight, she only paid attention to Teresa.

The drones followed them to the canyon. In the deeper darkness, it was hard to make out the path, but she moved forward all the same. Now that she'd come this far, second thoughts started to haunt her. What if she picked the wrong cave and startled some local animal in its sleep? What if Timothy wasn't there? High above, the orbital construction platforms rippled and glowed. If she looked out of the corner of her eye, she could even make out the *Whirlwind*, the third *Magnetar*-class ship. Only no. It was the second now. The flute-thing called out again, closer this time. She wished she'd brought a light with her. She hadn't thought starlight would be so dark.

She found a deeper shadow that she thought was the sandstone shelf. She ducked under, her hand stretched in front of her. It only took a few steps more before she saw the cavern's lights. The cavern was brighter than the night, and warmer too. The repair drones that walked with her had followed her in, or other ones had been there to begin with. She couldn't tell them apart.

Her heart was beating faster. She was sure that she'd turn the last corner and find Timothy gone, his camp vanished.

"Timothy?" she called, her voice trembling. "Are you here?"

A slick metallic sound came from her right, and Timothy stepped out of the shadows, a gun in his hand. He shook his head. "You got to be more careful, Tiny," he said. "My eyes ain't what they used to be."

Timothy's expression and the casual way he held the gun were so comic, Teresa had to laugh. Once she started, it was hard to stop. The laughter seemed to have a life of its own, hilarity bursting out of her in a riot unstoppable and violent. Timothy's confused expression only made it funnier. She howled, she buckled over, holding her sides, and at some point she noticed that it wasn't laughter anymore. That she was crying.

Timothy watched her like she was giving birth and he wasn't a doctor. The visible understanding that there was probably something he should be doing to help, but he didn't know what it was. In the end it was Muskrat who came and put her thick, heavy, fur-covered head against Teresa. The violence of her emotions left her spent, and she rubbed the dog's ears while the drones set up a little chorus of queries, aware that something was broken but not how it could be fixed.

"Yeah, okay," Timothy said after a while. "Rough night. I get that. Come on back. You can . . . I don't know what you can do, but I want to sit down, so let's go back here."

Her limbs felt heavier as she walked, but her heart felt lighter. As if she'd come all this way for someone to watch her break down, and even though nothing had changed, something was better.

The big man sat on his cot and rubbed his eyes with the knuckle of his first finger and his thumb. She sat across from him on a metal box, her hands in her lap.

"So," he said. "I don't really know how to do this part. But I think the way it goes is you tell me what's bothering you?"

"So much has happened."

"Yeah?"

And she told him. All of it. From her father's tit-for-tat plan with the things hidden at the gates to the death of the *Typhoon* to the conspiracy to hide her father's illness and the bemused absence that he'd become. The more she talked, the easier it got. Timothy barely spoke, only asking a few questions here and there along the way. He just gave her his attention and asked for nothing in return.

Eventually she ran out of words. The sorrow in her chest was still there, still as painful and heavy and hard, but bearable somehow in a way it hadn't been before. Timothy ran his palm over his scalp. It was a dry sound, like dust hissing against a window. Back toward the mouth of the cave, Muskrat barked happily.

"Yeah, that all sucks," he said. "It's like that sometimes."

"It gets better, though. Right?"

“Sometimes. Sometimes it’s just one shit sandwich after another.” He shrugged. “What are you gonna do? It’s the only game in town.”

“I just want—”

Timothy held up his hand, gesturing her to silence. Muskrat barked again, the bark she used when she saw a friend. And there were voices behind it. Timothy scooped up his gun, his eyes fixed on the entrance.

“It’s okay,” Teresa said. “They’re probably just following me.”

Timothy nodded, but he didn’t seem to hear her.

“Following you?”

“I have a tracker. They planted a tracker on me, can you believe that?”

His eyes widened, just for a second. “Ah, Tiny. Didn’t see it coming down like this,” he said. She saw something in his face, and she couldn’t tell if it was sorrow or amusement or both. Resignation, maybe. “You should lie down on the floor there. Flat as you can. Put your hands over your ears, okay?”

Who’s there? came from the entrance, sharp and hard.

“No, it’s all right. They’re not going to be mad at you,” Teresa said, and Colonel Ilich stepped out of the gloom, a rifle in his hand. Three guards from the State Building were behind him.

Everyone went quiet. Teresa felt a sudden dread bloom in her heart, the realization that she’d misunderstood something badly. That she’d made a mistake she couldn’t take back.

“You!” Ilich snapped. “Put the gun down! Get away from the girl!”

“Close your eyes, Tiny. You don’t want to watch this.”

“Stop,” Teresa said. “He’s my friend.”

The roar of Timothy’s gun was louder than anything she’d ever heard. It was like being punched from all directions at once. The sound alone was a kind of violence. She dropped to her knees, her palms pressed against her ears. Gunfire ripped through the cave. Ilich ran toward her, fear in his eyes, and pushed her down, shielding her with his body.

Timothy was screaming like an animal—deep and full of rage. He pushed past her, past Ilich, barreling toward the guards like he could brush them aside. The charge seemed to make the nearest man forget he had a gun

in his hand. He tried to grab Timothy, but Timothy took the man's wrist like it was something that belonged to him, shifted it until it snapped. Ilich pushed her down again, and she had to fight to see. Another gun fired. Someone shouted, not Timothy. Teresa twisted under Ilich's knee, trying to find Timothy in the gloom. She got her head up enough to see him just as a wound bloomed on his leg. Redness splattered the cave behind him as he fell. Timothy lay in a fast-spreading pool of his own blood, twitching. Trying to get up as if he didn't know his leg had been turned to splinters. He bared his teeth in pain and anger, swinging his gun around toward Ilich. She screamed *No!* She felt it ripping at her throat, but couldn't even hear it herself.

Someone fired twice. The first round took the top of Timothy's head off. The second blasted a wide hole in his chest. Timothy collapsed, motionless. The silence after rang like a bell.

"What did you do?" Teresa said. She didn't know who she was saying it to. Ilich pulled her up. He bunched her shirt in his fist at the back of her neck like it was a handle, pushing her past Timothy's body.

"Fall back," Ilich said. "Fall back to the truck! We have the girl."

Teresa shifted, trying to turn back to the cave. Timothy was hurt. She needed to help him. Ilich yanked her along.

"Stevens is hit pretty bad," one of the guards said.

"Carry him. We can't wait here. We don't know if the target was alone. We have to get the girl out."

"He's my *friend*," Teresa shouted, but Ilich didn't hear her, or he didn't care.

The night air was cold now. She could see her breath in the glare of the guard transport headlights. Ilich shoved her into the backseat before pushing in beside her. They threw the wounded guard in the back. He groaned when the transport truck lurched backward. Ilich leaned against her, murmuring something fast and low. Her ears weren't right, so it wasn't until she could shift enough to see his lips that she understood it was *fuck fuck fuck fuck* . . . There was blood on his neck, dark and thick.

"Sir!" the driver said. "Are you okay? You've been hit."

“What?” Ilich said, and then, “Teresa, are you okay? Tell me you’re okay!”

The transport truck hit a bump in the road, shaking a little, and the shock of it all fell away. She understood clearly what had just happened. She balled her fists and she shrieked.

The infirmary was quiet. She was shaking. Cortázar and Trejo and Kelly were all there, standing in the anteroom talking to each other in low, urgent voices. Ilich was in the autodoc beside hers, a thick bandage on his shoulder and neck. Dawn would be coming soon. She didn’t care as much as she’d expected to. The autodoc fed something cool into her bloodstream. Another sedative, maybe. It made her feel cloudy, but she wasn’t going to sleep. She half suspected she’d never sleep again.

When the door opened, Trejo stepped in. He wore gray flannel pajamas a size too small for his belly. He didn’t look like the secret ruler of humanity, he looked like a sleepy uncle. He pulled a chair up to her bed, sat down, and sighed.

“Teresa,” he said, sternly. “I need you to tell me everything you know about the man in the cave. What he said to you. What you said to him. Everything.”

“He was my friend,” Teresa said.

“He was not. We have body camera data from Ilich and the recovery team. The facial recognition data matches the . . . the bloodstains. We know who he was, and once we have a secure perimeter and get a cleanup team back into that beshitted cave, we may have a better idea what he was doing here. But I need to hear everything from you. Now.”

“His name was Timothy. He was my best friend.”

Trejo’s jaw went tight.

“His name was Amos Burton. He was a terrorist and murderer and the mechanic on James Holden’s ship, and apparently he’s been sipping tea with the daughter of the high consul for months. Anything you told him, the

underground may know. So begin at the beginning, go slow, be thorough, and tell me what you have *fucking* done to us.”

OceanofPDF.com

Chapter Twenty-Eight: Naomi

The thing that surprised Naomi most was how quickly it happened. How little convincing people needed. She had assumed that Emma and Chava would agree because they knew her personally. They had a history together. And maybe their contacts would be amenable to connecting with her, since known-safe members of the underground were vouching. After that, she had expected it to be difficult—sometimes impossible—to convince Saba’s network to reveal itself to her. Everyone in the underground was in danger of death. Maybe worse. They would all be as wary as she would have been in their place.

She’d overlooked the fact that she was Naomi Nagata, and that fear drove people to look for leaders. Emma had five contacts in the underground. Three of them were on ships in other systems, but one was a technician in Auberon’s planetary transfer station, and the other was an engineer on a Transport Union ship that was presently in-system. Chava’s connections were more local. A doctor at one of the major hospitals down the well. A taxation agent and forensic accountant on contract to Laconia. A manager of a fashionable brothel at the governmental center. The husband of a security specialist contracted with Laconia to maintain and protect the biometric identification systems. Some of those were single nodes in the network, but some were cell leaders with four or five other connections, some of whom knew a couple other people and so on until it felt like the underground had as many loyalists as the governor.

It was an illusion, but it was a powerful one.

“The thing is the fuckers came in like the flood, yeah?” the man across the table from her said. He was a communications engineer for an

independent design collective tasked with building a tight-beam network—repeaters and relays—in the still-unexplored vastness of Auberon system. He called himself Bone, but Naomi was fairly certain it was a nickname he'd given himself. "Overwhelming force, Laconia. Unstoppable. Which, yeah, they are. But you can beat the shit out of a river and not change how it flows."

"Wouldn't know," Naomi said. If he heard her, it didn't slow him down. Some men got loquacious when they were nervous.

"They're one system, and not that populous. They've got no choice but to rely on us poor local bastards for help. And Laconia . . ." He chuckled. "Laconia has no local tradition of cheerful corruption. They don't expect it, and they don't know what to do about it when they find it. Besides make the kind of examples of people that piss off all their families."

"Give them time," Naomi said. "They'll catch up. If we let them."

Bone grinned. His left upper canine had been decorated to look like it was made from stone. Fashion never stopped. It was one of many things Naomi was pleased that age allowed her not to care about anymore. She smiled back.

The public park was another sign of Auberon's wealth and success. The designers of the lunar base had built in common areas and open space. The dome above them was still under the lunar surface, but light panels made it seem as open and airy as a resort on Titan. Children skipped in the thin gravity, hopping from bar to bar of a climbing structure that rose almost half the height of the *Roci*. At a full g, a slip and fall would be fatal. Here, they might get bruised.

A drip fountain beside them filled the air with white noise as the tiny drops drifted down from the ceiling and tapped an inclined slate, flowing slowly down to a fish-filled reservoir. It was beautiful. She didn't feel like she belonged there.

"The repeaters," she said, bringing them back to the issue at hand.

"Yeah, yeah, yeah," Bone said. "We got your design out. Bottle network is on its way. Nice thing about it? Cheap. Any union ship close to a ring gate can slip something out the lock." Bone made a pushing gesture so

graceful it was almost dance and then snapped his fingers. “We’ll be trading fresh gossip before you know.”

“Sol and Bara Gaon are the priorities.”

“Already got bottles through to them. They know we’re here and what we’re doing. This can only spread.”

“And Laconia?”

Bone shrugged. “Got to figure they’re putting up new repeaters, but we don’t got one yet, and Auberon has money. So . . .”

So they should have been a priority. Maybe they were, and other cells in the underground were breaking them. The bottle network was slow compared to the light-speed transmission they had all become accustomed to, but it was also hard to stop. Repeaters at the gates were static or nearly static targets. Easy to identify and easy to destroy. The thing that had made them safe and stable all these years had been the eyes of Medina in the slow zone, the certainty that any action against them would be identified and traced back. With no eyes left in the slow zone, impossible things were suddenly practical.

“Our local network?” Naomi said. “It’s unbreakable?”

“Everything’s breakable,” Bone said. “But we’ll make them work for it, and it fails in sections, so we can shut it down before everyone’s compromised.”

It was the right answer. If he’d said they were safe, she’d have trusted him less. “Bien alles,” she said, and rose. Bone followed her lead, holding his hand out to shake hers with a nervousness that looked like hero worship. She took his hand. Whatever the future brought, Bone could go through it remembering that he’d shaken hands with Naomi Nagata. She didn’t like this sense of wearing a mask that everyone else had put on her, but it was the price she paid to do what needed doing.

“I’ll be in touch,” she said, and they walked away, taking different paths out of the common space.

The corridors and passages of the base were wide and had low ceilings for someone her height. White tile glittered the same on the walls as the floor. Thirty people could have walked abreast. She put her hands in her

pockets, kept her eyes down, inviting everyone she passed to overlook her. Walking helped her think.

Her problem—and her enemy’s—was the scale of it all. Millennia of human history had played out on the surface of a single planet. Mere centuries in the wide void between worlds. And all of that had happened before her own birth. The universe she’d known had always had stations around Saturn and Jupiter, rock hoppers eking out livelihoods in the Belt. Almost every gate led to another system that wide and complex, but without humanity. Without history. Without the infrastructure of everything humans took for granted and relied on.

It had seemed smaller when there was a hub to the wheel. Now, anyone could transit anywhere, and there was no one to coordinate or record it. The more she thought about it, the more untenable the idea of rebuilding inside the slow zone seemed. Medina and the *Typhoon* and the fleet of Transport Union ships that had been caught there were proof that the nature of the space itself there wasn’t benign. Putting a crewed base there was risking the death of everyone involved. An automated one was a statement of faith in their computer security that history didn’t justify. Holding and protecting over thirteen hundred gates from their starward faces was an entirely different prospect from holding one strong position in the center. It would take the largest fleet humanity had ever built just to watch the gates, and that didn’t take policing the vastness of their solar systems into account.

Duarte had come in with the strategy of permitting local governments autonomy so long as they followed his rules. It had seemed like a kind of magnanimity at the time. It looked more like necessity now.

And deeper even than that, the eerie words *two gates lost*.

There had to have been a moment when they could have refused. When she and Jim and maybe a handful of other people could have looked at the ring gates and the vastness beyond them, seen the danger, and tiptoed away. All the signs had been there. A civilization had built all this vast and unimaginable power and still been scattered like knucklebones. What had made them think it was safe for them? That it was worth the risk?

She took the tube to Chava's block as if she belonged there. The crowd on the platform was a mix. Bright-eyed, tea-drinking third-shifters on their way to work. Weary second shift just coming home or heading out to dinner. A handful of youths in outlandish fashion burning the first-shift midnight oil. Naomi stayed quiet and apart, and she appreciated the beauty of it all. And the innocence. A hundred people, more or less, waiting for a tube car on a moon above a planet that circled a sun that hadn't born them, and jockeying to be the first ones through the door so that they could get a good seat. Maybe the most human thing possible.

A young man in a brown collarless shirt scowled at her for staring, as if maybe she was mocking him. She nodded her apology and looked away.

Her life as Chava's guest was pleasant. Waking in a real bed, showering with water that didn't recycle twice while she was under it, eating food that had more than one taste. The long months Naomi had spent in her container felt more and more like a spiritual pilgrimage, a journey she had gone through and emerged from changed. It hadn't seemed like that at the time.

Their schedules had drifted, and she was awake long after Chava had gone to bed. Naomi stayed quiet while she worked, but she worked. The underground in Auberon was well developed, but until she decided it was time to throw the governor and his political officers into a hole, her options were limited. Entrench. Develop more holes in their security. Compromise the enemy further. But there was nothing of Laconia's grand strategy to be learned. They were as cut off as she was.

And then, only days after her own messages had slipped out through the rings, the bottles began to return. They came in one at a time, a trickle of data that snuck into the system. Reports, requests, and messages encrypted with the most recent ciphers. Bara Gaon was on lockdown, but the exploration sites were still autonomous. New Albion had taken the opportunity to sabotage the Laconian transfer station and were now being hunted by the local security forces. Transport Union ships had started

making emergency transits to systems like Tabalta and Hope where local populations were in danger of collapse. It was like slowly beginning to recover her eyesight after being nearly blind.

The message from Sol system originated on Callisto, the data passed covertly to a datafarm on Ceres and repackaged into a bottle on a Transport Union ship near the Sol gate. It was routed to her.

On the screen, Bobbie looked tired and grim. A grayness had come into her features, and the thick muscles of her neck had begun to look wiry. A decryption artifact locked a corner of the image like part of her shoulder was frozen in time while the rest of her was free to move.

“Hey there,” Bobbie said into the camera, and a loneliness Naomi hadn’t known she felt swamped her for a moment. She felt the memory of that last hug before she’d left Sol, and it was more alive and real to her than the last time she’d seen Jim. “I have something. An opportunity, I think. Alex wants me to run it past you.”

Naomi listened as Bobbie laid out the situation. The *Storm* trapped in Sol, first by the catastrophe in the slow zone, and now by the *Tempest’s* presence. The antimatter.

She felt herself sliding into the same analytic mind-set that had been her whole life in the container. She’d hardly been out—a few weeks on the *Bhikaji Cama* and now here with Chava—and slipping back already felt cold and constraining. Her mind ticked through the implications of Bobbie’s plan: the exposure of the *Storm*, the scrutiny that would fall on the Jovian moon bases, the symbolic and practical effects of Duarte’s losing a second *Magnetar*-class ship.

And as she did, a quiet part of her mourned.

The day she’d gone into the container and committed herself to living as a pea in a shell game had been the day she left the *Rocinante* behind. It felt like relief at the time. Like her soul had been rubbed raw, and the container was her bandage. Her whole life, she’d survived the unsurvivable by falling back and getting small. And every time, she had come back healed. Scarred, sometimes. But healed.

All it had taken was a handful of human interactions to show her that the Naomi who had fled into the container wasn't the one who'd come out. Time had passed, and she had found what peace she was going to find.

When she'd taken up Saba's role, it had been from necessity, but it had also been because she was ready to. It was only after the fact that she was starting to see what leaders were. The price the position required.

The water started hissing, and a door opened and closed from back in Chava's bedroom. She was awake and taking a morning shower. It would be time for Naomi to go to bed soon. It was also safe to respond to Bobbie without being an impolite guest. Funny how that still seemed to matter.

She set her hand terminal up with the camera pointing to her, then used the security filter to strip out the background. If the signal was intercepted, there wouldn't be artifacts leading back to Chava. It left Naomi looking like she was floating in a featureless void. She started the recording.

"Hey, Bobbie. Your plan . . . looks solid. I know that's not the argument I was making the last time we spoke, but the situation's changed. Several situations have. I still maintain that working through political means to a peaceful endgame is critical. But if there is a chance to do that without a *Magnetar*-class ship keeping its boot on Sol system's throat, it'll be easier. If it was just a ship, I think I might still have some reservations, but you're right. Duarte made the *Tempest* a symbol. We don't often get the chance to kill the enemy's story about itself.

"Good hunting. I love you."

She closed the message, fed it into the local encryption, and queued it to be sent to Bone and his system network. It might take days for it to get onto a bottle and through the gates. She tapped the table with her fingertips, wanting to call it back. There was still time to stop it. Soon there wouldn't be.

"Hey," Chava said as she stepped in from her bedroom. She was already dressed for her shift. Sharp, professional clothing, hair neat. "What are you up to this fine morning?"

"Second-guessing myself," Naomi said. "And I think it's my evening. I did make you coffee, though."

“You are a kind and thoughtful woman,” Chava said as she poured herself a cup. The drift of the coffee to the cup was like watching the slow fountain. “You’re going to have traffic analysis problems, though.”

“You mean the way that vastly more bottles come into and out of Auberon than any other system?” Naomi said. “Yes, that’s an issue. Is it a hint? I know you weren’t looking for a roommate.”

“You can stay as long as it’s the smart move. But maybe not after?” Chava’s smile faded. “What’s wrong?”

Naomi chuckled. “You mean apart from maybe having sent two of the people I care about most to their deaths?” She wiped her eyes. “Shit.”

Chava put down her cup. She took Naomi’s hand in hers. The feeling of fingers against her own was almost more than Naomi could stand, and she held on like Chava was a tether.

“I spent a lot of my life trying not to be a particular kind of person,” Naomi said. “Trying not to make certain kinds of decisions. But here I am all the same.”

They were silent together for a moment. When Chava spoke, her voice was light. Almost conversational. “When I was in my apprenticeship, back in the day? The hardest thing I had to do was manual docking. Every time the qualification run came, it didn’t matter how much I’d practiced. I’d take the controls, override the system so I had control. The only thing in my head was *Don’t fuck up, don’t fuck up, don’t fuck up*. And then I’d fuck up. I focused so hard on the thing I was afraid of, I ran straight into its arms every single time.”

“Are you trying to make me feel better?”

“No,” Chava said. “We’re too old for that. I’m trying to make you feel like you aren’t alone in it. That’s all I’ve got.”

Something in Naomi’s chest shifted. A titanic emotion breaking free. She braced herself for sobs, but all that came out was a profound sigh. The dream had been there all along, never quite given up. She would find a way to bring her family back together. They would all survive the meat grinder of history. Everything would somehow be well.

There had been a moment. It hadn't been that long ago. All she'd had to do was announce herself, accept Duarte's invitation, and leave all the struggle behind. She couldn't remember quite how she'd decided on this path, but she saw that she had. There was no one to blame but herself. She conjured up the dream of waking up beside Jim. Drinking coffee with him. Hearing Alex and Amos joking with the subtle hum of the *Rocinante* behind them. She let it go.

She squeezed Chava's hand and let that go too.

Chapter Twenty-Nine: Elvi

Elvi sat in the back of the car. The driver was a young man with close-cut, tightly curled hair. Mostly what she saw of him was the back of his neck. As the State Building fell away behind them, the city itself spread out. She could still remember the first time she'd seen it, brought in by soldiers with the scrupulous politeness of a concierge at a luxury hotel, only with sidearms. The streets were wider than anywhere she'd ever been, with greenways along the sides. Buildings rose up, tall and beautiful, with solar collection windows and rooftop gardens like Frank Lloyd Wright had been reborn and made skyscrapers. The scale of the place was massive and boastful. She remembered being overwhelmed by it, the first time.

Now, it seemed weirdly brittle. Millions of people lived in the capital city, and almost none of them had been there longer than a decade. The traffic was stopped for her motorcade, and she saw the normal people—civilians and citizens and military with status lower than hers—craning their necks as she passed, trying to figure out who she was and whether they should be excited to see her. There were no monuments, no billboards, no old neighbor-hoods. She sort of hated it.

“Would you like some water, ma’am?” the driver asked.

“No,” Elvi said. “Thank you.”

He nodded without looking back at her. She leaned back into the plush seat and tried to straighten her leg. It didn't help the ache.

The labs were massive. Technically it was part of the University of Laconia, but it was run like a military camp. The gate guards waved them through without checking, and the car took a looping path through campus, heading toward the pens. She fidgeted with her cane. As they made the last

turn, a man came into view, clearly waiting for her. The relief that flooded her when she saw that it wasn't Paolo Cortázar was telling.

"Dr. Ochida," she said as she levered herself up out of the car.

"Dr. Okoye. It's good to have you back. I heard about your fieldwork. I have to say, you aren't selling me on it over nice safe labs."

"Well, the data was interesting," she said as they started down the path to the Pen. It was a dark, windowless cube, hardened against attack even in the heart of the empire, where attack seemed impossible. They said God didn't play dice, but if He did, they'd look like the Pen. Huge, square, and inscrutable.

"I hear they're sending you into the holy of holies," Ochida said. "Paolo's very close with his senescence project."

"It wasn't my choice."

"The high consul does what the high consul does," Ochida said as they reached the guards. Elvi handed over her ID badge and submitted to the verification scan. It was just a touch on her wrist, but it felt more invasive than that.

"With the rich and powerful, always a little patience," she said. The guards stood away and let them through. There was a little pop when the door opened, and the air pushed in with them. Inside, the next set of security protocols blasted them with air and scanned every millimeter of their bodies before the inner door opened.

Inside, the Pen was almost more reassuring. It looked like the kind of lab she'd been in for decades, on and off, at half a dozen universities and research institutions. Safety procedures were posted on the wall in bright fonts and six languages. The air smelled of phenol soap and air scrubbers.

"Come on," Ochida said with a smile. "I'll walk you over."

Don't get comfortable, Elvi told herself. This isn't your home court. You aren't safe here.

“I just had the most interesting conversation,” Faye had said back on the day she’d first been assigned her task.

“I could say the same. But mine’s classified, so why don’t you go first.”

“Well, he was being awfully cagey. But I think our old friend Holden just told me Cortázar’s plotting murder.”

Elvi had laughed because it was a statement too horrifying to match the pleasant setting, and sometimes being overwhelmed was kind of funny. “I’m not sure I can deal with that right now,” she said. And then, “Did he really?”

Faye shrugged. “No, he didn’t. He very carefully and *specifically* didn’t. We had a perfectly lovely conversation about the importance of teaching children about negative space as a tool of political analysis. Then we talked about everyone at the head of the science effort except Cortázar while he made significant eye contact. And then made a weird segue into the history of political power struggles on old Earth, with a focus on Richard the Third.”

“That’s . . . obscure.”

“Not *that* obscure. Shakespeare wrote a play about him.”

“What was it called?”

“*Richard the Third*,” Faye said. “Are you feeling all right?”

She leaned her head against his shoulder. He was warmer than usual, but it wasn’t strange to run a low-grade fever when a limb was regrowing. “I wasn’t a theater major, and I’ve had a long day. What was the point of it?”

“Richard was an asshole and killed a bunch of people, but specifically a couple of kids. Heirs to the throne or something.”

“You weren’t a theater major either.”

“I was not.”

Far above them, a thin sheet of clouds moved across the stars, blotting some and revealing others. She wanted to close her eyes and fall asleep right there and wake up in their shitty apartment back on Ceres before she’d ever heard of Laconia or Duarte at all. All the things she’d learned, all the

money and status and discovery could vanish like a dream, and she'd still have been happy as long as all the rest of it went too.

"So negative space and then everyone but Cortázar, and a king who killed some kids."

"Well, technically a prince who clawed his way to power by killing some kids. I think."

"Spiffy," she said.

"Wasn't Cortázar one of the ones that worked for Protogen back before Eros?"

"Back *during* Eros," Elvi said.

"I'm just saying it wouldn't be his first time."

"He created the catalyst," Elvi said. "For me. Doesn't mean I'm a murderer."

"Yeah," Fayez said, but he knew she was thinking, *Except that it kind of does*. That was what decades of marriage were for. Intimacy and pattern matching as a kind of telepathy.

He sighed, shifted, and put an arm around her. "I may have been reading more into it than was there. It just seemed strange and kind of pointed."

"He meant something by it," Elvi said. "Maybe not what you got, exactly. But something."

"You're thinking about tracking him down and asking him?"

"I am."

"If he was being oblique because Duarte's got an eye on him, he won't be straight with you any more than he was me."

Unless I let him know that Duarte isn't watching anything right now, Elvi thought. The idea left a cold mark that could have been fear or excitement or something of both. She wondered what Trejo would think, and if Holden was even on the new, secret emperor's radar.

"Maybe I can come up with something," Elvi said.

And maybe she could have if they hadn't discovered Amos Burton and his pocket nuke that night and Holden hadn't been thrown in a cell before morning.

Cortázar smiled when he saw her like it was something he'd told himself to remember to do. Elvi felt like her answering nod was equally fake, but she didn't know if he'd notice or care.

"Anything else I can help with, Paolo?" Ochida asked.

"Thank you, no," Cortázar said. "We'll be fine."

Ochida stepped away. Everything about it was perfectly normal and polite. It all felt like a threat. Cortázar turned and started walking toward a set of metal doors. She had to trot to catch up with him.

"I'm sorry we had to push this until after lunch," he said. "I've been at the security office all morning going over the things they took from the spy."

"Amos Burton," Elvi said. "Kelly briefed me. It's a little weird. I knew him. We were both on Ilus at the same time. He saved my husband's life."

"Well, he had a pocket nuke with him in that cave, so . . ." Cortázar wagged his hand in a so-so gesture. "I was with the analysis team. Trejo's looking at the communication deck pretty carefully. It looks like the bastard's been out there for quite a long time."

"Do we know what he wanted?"

"Not yet, but we may still get to ask him."

"I thought he was dead."

"Oh my, yes. Very much so."

"Then how?"

He presented his lanyard to a locking mechanism, and the doors cycled open. She followed him into a darker corridor. The walls were thicker. Reinforced. It was a little sobering to think that the raw protomolecule of the Pen wasn't the most dangerous thing in the lab.

"Ilich fucked that whole thing up badly," Cortázar said. "Not his fault. He didn't know not to leave the body behind."

The doors closed behind them with a deep sound. Like a prison. The corridor acted as an airlock.

“After they shot the poor fucker in the head, Ilich pulled everyone back to protect the little princess,” Cortázar said. She heard the sneer in his voice, and thought of Richard III. “He should have left someone guarding the body. Or burned it before he left. Not his fault, really. He knows the rules about the repair drones, but he doesn’t know the reason behind them.”

A second set of doors opened, light spilling into the hallway. “I don’t understand,” Elvi said.

“You will,” Cortázar said lightly as he walked into the private lab. He’d been teasing her.

This lab was smaller than the Pen. She recognized some of the equipment from her own exobiology labs—array sequencers, proteome sample analyzer, NIR and low-resonance scanners. Other things were as strange as any of the alien artifacts she’d come across. Cortázar ignored them all, stepping across to a transparent polymer cage the size she’d seen used for simian and large-animal studies.

“Trejo thinks having a new set of eyes on all of this will help, but the truth is you’re going to be playing catch-up for months just to get to the point you can ask intelligent questions,” he said. “But to get you started? These were the original cases. The seed grit in our oyster.”

Two children were in the cage, a boy maybe seven or eight years old and a girl on the edge of adolescence. Their eyes were perfectly black, like the pupils had eaten iris and sclera alike. The girl stood up and walked toward the front face of the cage. Her skin was grayish. She moved almost normally, but when she stopped, there was a terrible stillness about her.

“What . . . ,” Elvi said, and then didn’t know how to finish the question. She’d heard the phrase *It made my flesh crawl*, but she’d thought it was a figure of speech until then.

“They were Alexander and Cara Bisset when they were alive,” Cortázar said. “Children of the initial scientific expedition that was on Laconia before the high consul relocated his loyalists here. The boy died in an accident. The girl was poisoned trying to eat local flora in the wilderness not long after. This is what happens when you have a dead body around the repair drones. Or, well. Sometimes. They don’t always take it upon

themselves to fix things, but when they do . . .” He nodded toward the dead children. *This is what happens.*

“I don’t know you,” the girl said.

“My name’s Elvi.”

“I’m Cara. Are you going to hurt us too?”

Oh, Elvi thought. Oh, fuck this. I don’t care what it takes. As soon as I get out of here, I will find a way to never, ever come back.

“The original bodies died twenty years ago, more or less,” Cortázar said. “These artifacts that were built from them have been static since their recovery.”

“So they’ll always be young?”

“Well. They’ll always look like immature human beings,” Cortázar said. “That’s not exactly the same thing. They have, for the most part, similar structures and chemistry to the original bodies, only very stable. Telomeres don’t shorten. Mitosis can run indefinitely. There’s no buildup of senescent cells or plaques. The immune response has a couple additional pathways and structures that are interesting. Really very nice work.”

“That’s amazing,” Elvi said, and the words felt like dropping a stone down a well. Deep and kind of hollow.

“The high consul’s interest in personal immortality came from them. He thought that if we could learn the differences in structure and function from these samples and reverse engineer them into a living body instead of a corpse, sort of the way carbon-silicate lace plating was based on long-lived architectural structures . . . well, that would be interesting. I tried a few animal models first, and made enough progress that I felt comfortable with a human trial.”

She leaned on her cane and fought back the dizziness. “Duarte agreed to that?”

Cortázar turned to look at her. He seemed confused. “Of course he did. It was the answer to his biggest problem. How do you hold a galaxy-spanning empire together over generations? Have someone running it who doesn’t die. Well, here they are. Things that have all the traits you need not to age and die.”

“Wasn’t he worried something might . . . I don’t know. Go wrong?”

“He understood there was some risk, but he thought it was justified by the possible return. We went very carefully, and the high consul had a great deal of faith in my abilities.”

“All right,” Elvi said. “Okay.”

“It was fine until you triggered that—” He gestured at her injured leg. “It was working. It may still work, with some adjustments and a new subject.”

“I didn’t trigger anything. That was Sagale, following orders,” she said, but what she thought was: *A new subject like Teresa*. It didn’t sit right. Cortázar turned his attention back to the children in the cage. *No, he wants it for himself*.

“I have complete records, of course,” Cortázar said. “I have them set up for you on the system here. Take as long as you want looking over them.”

“In here?”

“The project doesn’t exist outside of this room. The high consul was very clear on that, and I can’t imagine Admiral Trejo would want to reduce security.”

The private lab was smaller all told than her office back at the State Building. The younger one, the boy, came to stand beside what had been his sister. Elvi was going to be under their eyes the whole time she was here. She wondered whether Cortázar had set it up like that to make her uncomfortable. And whether the information he showed her would be anywhere close to complete . . .

“Wait,” she said. “Amos Burton’s body was missing.”

“They’re out looking for it now,” Cortázar said. “It will be very useful having an adult subject to compare with. I mean, it would mean more if I had complete scans and medical records of him from before the corpse was modified. That’s what we really need to move forward. But I’ll enjoy this all the same. There’s a restroom just outside the hall. And if you need food, you should probably have it outside. We’ve only ever had one unintentional protomolecule contamination, but—”

“Understood,” she said, and sat at the low monitor. The chair squeaked.

“I’ll come check in on you later,” Cortázar said. He forgot to smile this time. The doors closed behind him, and Elvi turned to the reports and the data. Her head felt like it was full of bees. There was too much, and it left her unsettled and jumpy. She expected Cortázar’s work to bounce off her brain and puddle on the floor. Actually engaging with it was too much to ask.

But once she’d started looking through it, her focus started coming back, and a familiar calm came over her. Other people might take reassurance in a lover’s hand or a cup of herbal tea—really a tisane since it didn’t have tea leaves, but *tea* was the term people used anyway, which Elvi had always thought interesting. Elvi only had room in her mind for learning or panicking. She couldn’t do both, and she didn’t like panic.

The thing that struck her first was how small the differences really were. Cortázar wasn’t a biologist. His background was nanoinformatics, which had a huge overlap when it came to things like genetics, epigenetics, and heritable cytoplasmic proteins, but missed basics like anatomy. The way the kids’ hearts had changed to adjust for a different viscosity in their plasma, the way that their blood had changed to a more efficient, non-cell-bound hemoglobin analog, all the other tweaks and modifications weren’t really changes in kind. They were just improvements.

Evolution was a paste-and-baling-wire process that came up with half-assed solutions like pushing teeth through babies’ gums and menstruation. *Survival of the fittest* was a technical term that covered a lot more close-enough-is-close-enough than actual design.

When she looked up and saw the children looking back at her, it was five hours later, her leg ached like hell, and the fear was gone. The grayness in their skin was an artifact of the oxygen transport. The blackness of their eyes was an optical structure that was better at capturing light. Whatever was going on with the new kind of neurons in their brains and the extra layer in their neocortexes, all the old, purely human structures were there too.

The process of re-creating all that using tools out of the protomolecule’s toolbox was an act of hubris that took her breath away. If anyone besides

Duarte and Cortázar had been part of that conversation, there would have been prosecution. Two men, each convinced of their exceptionalism, were capable of leapfrogging over vast chasms of maybe-this-isn't-a-great-idea and this-is-totally-illegal. Elvi had become convinced that Cortázar was jealous that Duarte intended to feed his own daughter into the same grinder instead of his pet scientist.

She levered herself up on her cane and walked to the transparent cage. The boy stepped back, like he was afraid of her. The girl—Cara—stood her ground.

Development into a mature form wasn't the same as aging and death. Maybe the drones hadn't understood that. So that meant something about how the protomolecule designers had functioned, didn't it? That their designs didn't take growth and maturation into account suggested that the original designers only had mature forms. Adults making adults. She tried to imagine what that would be like.

"Can I ask you something?" Elvi said.

For a moment, Cara was still as stone. When she nodded it felt like watching a statue come to life.

"Did you and your brother lose time?"

"When the thing happened, and we could see the air?"

"Yes, then."

"I don't know. He doesn't give us a clock to look at."

"You're conscious, then. You're not . . . You aren't just . . . You and your brother are sentient? Self-aware?"

The huge, black eyes changed. Glimmered. A thick tear rolled down Cara's cheek. Elvi put her palm against the cage.

"I'm sorry," she said. "I am so, so sorry."

Chapter Thirty: Bobbie

Bobbie couldn't sleep.

This was a new thing, or at least one that she didn't remember from when she was young. Back when she'd been active duty with the MMC, she'd been able to close her eyes and lose consciousness whenever a few minutes presented themselves. The idea of lying on a cot in a converted office, staring up at the ceiling, strapped lightly to keep from launching herself out of bed given Callisto's mild gravity . . . It wouldn't have made sense to that Bobbie Draper.

But here she was, three hours into her sleep cycle, making an inventory of her muscles and forcing each tense one to relax. A live monitor on the desk's surface threw flickers of light and darkness above her. She noticed the tension that had crept back into her shoulders and made herself release it for the fourth or fifth or twenty-fifth time. She closed her eyes and willed them to stay closed. Something in the hallway dripped. Condensation that might mean a failure in the heating system or in the air recyclers. She tried to ignore it.

Her crew was scattered through Callisto Station or on the *Storm* or in their own cots in the complex of smugglers' caves. It made her anxious to have her people diffused out into the civilian population like that. It also made her anxious to have them all together where they'd make a single target. The Laconian security forces only needed one lucky break. She needed all of them.

Her shoulders were tense again.

"Fuck."

She undid the restraint with one hand and hauled herself up. Maybe an hour in the *Storm's* gym would get her past the worst of her insomnia. But on the way out toward the hangar, she stopped at the desk, checking again the way she did fifty times a day. The map was broken into two frames. The smaller one showed the relative positions of the major bodies in Sol system, tracking the inevitable and predictable change in cartography like an orrery. The larger showed the Jovian system in great detail with data copied from the traffic control logs. On the small screen, Jupiter and its moons looked calm and serene, passing through the vastness of space with the tranquil beauty of the inevitable. Closer up, it was like a beehive. Hundreds of ships from ancient rock hoppers and mining skiffs to the *Tempest* and everything in between.

It was the *Tempest* that drew her.

Trejo had transferred out of the system on one of the fast Laconian shuttles, burning hard back to Laconia to deal with the crisis in the slow zone. The *Tempest*, on the other hand, had been sniffing around the Jovian moons like a dog searching for its lost antimatter. It had been in a complex orbit near Ganymede most of the time, though once it had darted out to Europa. It would come to Callisto eventually and force her hand. Until then, the best she could do was take comfort in imagining the fresh new Laconian vice admiral losing sleep in his cot because a moon-killing load of antimatter had gone missing and it was his job to find it.

She tapped the red dot on the map that was the *Tempest*. "Anything you can do, I can do better."

An alert popped up. A newsfeed from Ceres Station with a breaking report. She opened it, and a young man with a Lunar accent looked earnestly up at her from the desk.

"This is Davis Myles with *Ceres Beat*, and behind me you can see station security in cooperation with Laconian state intelligence agents securing a cell of criminal separatists here at the heart of Ceres Station in what is being called the biggest bust since the coalition joined the Laconian Association of Worlds."

Bobbie felt the tightness across her back get worse. It wasn't only that every loss to the underground was more risk to her and hers. She hated the way history was being rewritten before her eyes. *Sol system joined the Association of Worlds* was a hell of a way to say, *Laconia trucked in a half-alien warship and killed the shit out of everyone until we showed them our bellies.*

The time was coming when, even if she didn't hear from Naomi, she was going to have to make the ancient human decision again: fight or flight. As the reporter enthused about how many guns and enemy soldiers had been captured, she cracked her knuckles. She had three options. Take on the *Tempest*, run for the gate, or destroy the *Storm* and let her crew dissolve into the civilian population. Every option was its own kind of bad.

"The cell was exposed by the discovery of an encryption package running on a public system," the reporter said, and the feed kicked over to a wide-faced woman with a pattern of moles on her cheeks that looked like paint spatter.

"The activity of the decryption package coincided with a data drop from known separatist elements earlier today," she said, and Bobbie killed the feed.

She made a connection to Jillian. Her second in command accepted like she'd been expecting her. Before Jillian could speak, Bobbie asked, "Did a bottle come through?"

"It did," Jillian said. "We got a full copy of the data. I was going to let you sleep until the decryption run was finished."

"We're running the decrypt on our own system, yeah?"

"You saw the thing on Ceres," Jillian said. It wasn't a question. "Those yokels were stupid and so they'll die. Good riddance. We're not stupid. We won't die."

"How long before the data's clean?"

Jillian shrugged. "Another hour, maybe."

"I'll be in the gym," she said. "The minute it's done, I know it. Understood?"

“Yeah, okay,” Jillian said, and Bobbie dropped the connection. Any hope of sleep was gone now. Her nerves were as bright as stars. She pulled the tactical map back up. The red dot of the *Tempest* was still near Ganymede. She stared at it for a long moment as if the commander might be able to feel her attention, might be scared by it. She closed its display and went to the *Storm*.

The gym was bright and clean. All the equipment was Martian design strained through Laconian technology. Bobbie threw herself into the effort like it could help her forget, and it did at least a little bit. She’d been in the resistance gel for forty minutes when Jillian’s message came through. The bottle had been from Auberon. From Naomi. It was the reply she’d been hoping for. Bobbie, panting and wet from exertion, opened the message file.

The background filter made Naomi look like she was in a featureless white room. Like she was an angel, delivering her message from some abstract heaven. Naomi tipped her head forward unconsciously before she spoke, the way she did when she was delivering bad news.

“Hey, Bobbie,” she said. “Your plan . . . looks solid.”

Bobbie grinned until her cheeks ached.

In his last days, her grandfather talked sometimes about how weirdly clear his early memories had become. He might not quite remember the name of his nurse or when the man had last been to check on him, but the details of his childhood were vivid and immediate. Like the past was growing stronger as his present and future wore thin. He told the story about seeing a living cat for the first time, and how strange it had felt to hold it, with the same awe in his voice every time. Bobbie’s memory hadn’t done that, not yet. But maybe there was something. When she called the crew back to the *Storm* for her briefing, all she could think of was when she’d been back in the service on Mars.

The leader of her first fire team had been Sergeant Huk. He’d been about half a head shorter than she was, with a terrier-thin face and a

receding hairline. She'd never known anyone before or since who could command her loyalty or instill fear in her the way he had. When she'd been right out of boot and as green as they come, he'd turned her into an actual Marine. Before every mission briefing, he had found a way to acknowledge her. A nod, a touch on her shoulder or arm. Something that meant that no matter what was coming next, she wasn't going into it alone. He never humiliated her by saying it aloud, and he never left it unsaid. After he retired, she'd found out he'd done the same for everyone.

Now, as her people returned to the ship, she did something similar. She stood in the airlock, seeing each of them as they boarded. Timon Coul, with his old OPA split-circle tattoo smudged by time until it was just a bluish blotch on the back of his hand. Liese Chou, with her pale-gray hair. Caspar Asoau, looking like a teenager surrounded by his grandparents. Denise Lu. Skaldi Austin-Bey. Ian Freeman. And almost last, Alex Kamal. Alex, her oldest friend, and the man she'd traveled with for what felt like half a dozen lifetimes now.

He looked weary, like she'd woken him from his sleep. Maybe she had. He wouldn't have complained. He paused in front of her, and for a moment, it was like they were back on the *Rocinante* together. Like they were home. She touched his hand, and he nodded to her like he understood perfectly. Probably he did.

When the crew was all assembled in the galley, she pulled up her map of the system. It filled the wall. Someone in the back coughed, and she realized she'd been looking at it for several long seconds. And that she was enjoying herself.

"All right," she said. "We have word from on high. New mission. High risk. High reward." She shifted to an image of the *Tempest*. As strange as the *Storm* was in its particulars, its architecture was essentially the same design language that Martian ships had been for decades before the starving years. The *Tempest* was something else. Pale, asymmetrical, with protrusions and curves more like some monstrous vertebra. "We are going to kill that."

She waited for a moment, half expecting mutiny on the spot. The *Tempest* had put its boot on Sol system's neck without seeming to break a sweat. She could have said *We're all going to turn ourselves inside out and become seagulls* and it might have seemed about as realistic. No one objected. Looking into their faces, she saw interest. Anticipation. She saw hope, and she knew she'd been right to want this.

"We have a small payload that will do the trick," she said, nodding to Rini Glaudin at the back.

"Payload of what?" someone asked.

"The *Magnetars* run on antimatter," Bobbie said. "The *Tempest's* resupply was on that freighter we took."

"Jesus," Caspar said.

"Correct," Bobbie replied. "But delivery will be difficult, and we're only going to get one shot. In our last mission we found, along with this antimatter, replacement parts for a sensor array very similar to what the *Storm's* using. I've been over the battle footage, and I know the story is that the *Tempest* shook off everything the Earth-Mars Coalition threw at her. But —"

She laid out the schematic. Overlapping fields sprang out from the *Tempest* like peacock feathers on display. The range of sensor arrays. She tapped one, and it dropped out.

"From the hits she took and from how she's been flying since, I think this is the array they need a replacement for. And if the information we have is right, it means the *Tempest* has a blind spot. Here."

She pulled the display out to showcase the thin cone of black where the enemy ship's eyes couldn't go.

"And if we're right about their need for antimatter, they won't be able to use the field projector. Which means they'll be down to conventional weapons only."

"Captain?" It was Caspar. Jillian scowled at the boy like she was ready to punch him, but Bobbie nodded him on. "I don't see . . . I mean, even with just torpedoes and rail guns, and even if there is a data hole there—"

“They can still take us in a straight fight, and they’ll still see us coming,” Bobbie said. “So we let them see us. We get a Callistan shuttle. Private, small. Doesn’t even have an Epstein. And we put it out”—she switched back to the image of Jupiter and its moons. A single bright-blue dot appeared—“here. And on an orbital path that looks like we’re heading for Amalthea. A crew of two with a gas canister torpedo. Now those are slow, yes. But they also run cold. Basically no heat signature.”

“Bist bien,” Timon said. “Ran hundreds like, back on Ceres, sa sa?”

Jillian’s voice was harsh. “Could we *not* interrupt the captain?”

“The hard part will be putting the *Tempest* into a flight pattern like . . . this.”

A red arc appeared going from Ganymede. A line marked the time at each point. She zoomed in to show how the little blue shuttle fell into the blind spot, and the long seconds it would stay there.

“This is the window,” Bobbie said. “It doesn’t look like a trap, because we aren’t trying to hide. We get there first, and we’re just part of the traffic. So all we need is a lure. Something so critical that the *Tempest* will follow it where we want it to go. That will be the *Storm*.”

She let it sink in. It was like she could see the implications settling in each face looking toward her. It was a sucker punch. One shot, and if it failed each and every one of them would be dead. The underground would lose its only warship with Laconian tech.

“I’ll captain the shuttle with Rini as tech specialist. Jillian will be in command of the *Storm*.” That made her second sit up a little straighter. Her jaw was firm. She looked like a hunting dog that had caught a scent. “The *Storm*’s mission is to hold the *Tempest* to this course so that the shuttle stays in the enemy’s blind spot.”

Alex, sitting to the side, leaned forward. His hands were on his knees, and his eyes were cast down toward the deck. She didn’t know what he was thinking.

“If anyone doesn’t want to do this,” Bobbie said, “I’m not going to force you. We have four days before the shuttle is ready and the orbits are where I want them. I will be accepting resignations until that time. No

sugarcoating. This is the most dangerous thing we'll have ever done. Even if we win, we may sustain losses. Potentially heavy losses. But each and every one of you has my word that if I thought this was hopeless, we wouldn't be doing it.

"I have sent detailed briefs to your team leaders. Look them over. If you have questions, for fuck's sake ask them. We're not going to screw this up because someone turned left instead of right. Understood?"

There was a ragged muttering of assent.

"I said, *Am I understood!*"

The reply was more like a cheer now. It filled the space. There was power in it.

"Outstanding. You have your orders. Dismissed."

Jillian was out of her seat in a moment, herding the crew like they were sheep. Nipping at them. It was something she'd have to get over before she had a command of her own. Bobbie let it play out, though. There was an energy in the ship that needed to work itself through. She felt it too.

Back in her cabin on the *Storm*, she put herself through the routine of cleaning and straightening her things. The cabin didn't need it, but she did. The ritual calmed her. She found herself humming. She didn't know how long it had been since she'd done that. She needed to go back to her little campsite and clear out all signs of her occupation, but she waited anyway. She'd almost decided that Alex wasn't going to come talk with her when he knocked at her cabin door.

"Hey," she said.

"Naomi said it was a good idea?"

"She didn't go that far. She might have just thought it was the right bad idea for the moment."

Alex managed a little smile. His melancholy made her feel almost ashamed of her lightness and anticipation. "If you need to step back, no one's going to think less of you. Kit's your son. Being part of his life and this too . . . If you've got to pick one, I'd understand."

"You left out a part of the plan. What happens after the payload hits?"

“We’ve never done it before. So apart from an explosion that makes a nuke look like a firecracker, I’m not sure what I’d say. The *Storm*’s a tough ship, though. Even if there’s some debris hits, she can take it. Probably.”

“You’re going to want to get that shuttle behind something, though,” Alex said. “Put me on it. I’ll get it to shelter.”

“I need you on the *Storm*. Keeping the *Tempest* where I need it, when I need it? It’s going to take a great pilot. That’s you. Rini and I will be in power armor. The shuttle might get shredded, but we’ll be better protected than it will. And you’ll be there to come pick us up.”

Alex shifted his weight. She could see him looking for objections the way old married couples could see when one wanted the other to pass the salt.

“I don’t like putting us on different ships either,” Bobbie said. “But this is the right way to do it.”

“Yes, Captain. All right.” He sighed, and then, to her surprise, grinned. “This is going to be one hell of a rodeo.”

“They aren’t going to know what hit them,” Bobbie said. “My only regret is that Trejo won’t be on the ship when we blow it into hot, fast dust.”

“We can find him later,” Alex said. “I’m going to go obsessively run diagnostics on systems I know are solid so I can feel like I have control of something.”

“Sounds good,” Bobbie said. “I’m going to stay here and see how many of my crew quit rather than go through with this.”

“There won’t be any. These people will still follow when you lay siege to hell. We trust you.” Then, a moment later, “I trust you.”

The door closed behind him, and Bobbie sat in her crash couch like she was easing down into a warm bath. When she closed her eyes, she slept.

Chapter Thirty-One: Teresa

Was Timothy ever really my friend?”

Holden sat on the cot, his back against the wall. The paper gown he wore was crumpled and streaked with old blood. The sclera of his right eye was blood red and the flesh around it swollen. The cheek below puffy and dark. More than that, there was a carefulness to his movements that meant everything ached. The cell was tiny. The smallest closet in her bedroom suite was nearly twice as large. The only light came from a pencil-thin strip at the top of the wall that was too bright to look at directly but left most of the room too dark to read in.

“If he said he was your friend, then he was,” Holden said. “Amos wasn’t a man who felt the need to lie very often.”

“Why was he here?” she heard herself ask, just the way she’d been told.

Holden swallowed like it was a difficult thing to do. He seemed sad. No, not sad. Pitying. It was worse.

“They asked me all this before. I’m sorry that they’re making you do it too.”

Trejo had told her to stay on script, to only say what she’d rehearsed, but she took the chance now. “Maybe they thought it would be harder to lie to someone you’d hurt.”

“Maybe. I’ll tell you the same thing I told them. I didn’t know he was here. I hadn’t been contacted by him. I don’t know what his mission was or who put him onto it or how long he’s been here. If he had a way to get in touch with the underground, I don’t know what it was. And I don’t know why he had a backpack nuke, except that I’m guessing he at least wanted to

have the option of blowing something up. If I'd known he was here, I'd have told him not to."

Teresa looked up at the camera. Holden had answered her next four questions without her asking them. She didn't know if that meant she should skip that part or make him say it all again.

"How's your father?" Holden asked into her hesitation. "No one told me, but I put it together that something went wrong. Plus which, he hasn't come to question me. I feel like he and I have enough of a relationship, he would have."

My father's fine, she thought. She couldn't bring herself to say it. "Don't worry about him. Worry about yourself."

"Oh, I'm on that. Plenty worried for both of us. All of us."

"What happened to his body?" she asked, trying to get back onto the script.

"Your dad's?"

"Timothy's."

"I don't know."

She paused. Her gut was tight, and she felt a knot at the back of her throat. She felt it often these days. "He's dead. I saw it."

"So they've told me. He was a good . . . Well, he wasn't really exactly a good person. He cared enough to try, anyway. But he was loyal as hell." Holden paused. "He was my brother. I loved him."

"What is the underground doing?"

Holden shrugged. "Trying to make enough room under your father's boot that anyone else's opinion matters, I assume. That's what I'd be doing. Hold on. Just . . ." Holden levered himself up and spoke directly to the camera. "Could we cut this part short? It seems kind of shitty for her, and it's not going to change anything."

At first, there was no reply, then the hard clack of the magnetic door bolts opening. Holden sat down. Teresa felt the thrill of relief that told her how frightened she'd been, alone with this man. How glad she was that this part of the ordeal was over.

“They wouldn’t have let me hurt you,” Holden said. “Even if I’d wanted to. I mean, I don’t, but even if.”

Rage shot through her, unpredictable and vicious. “You’re not much of a dancing bear anymore,” she said.

Holden leaned against the wall, let it hold him up. When he smiled, she saw that one of his eyeteeth was missing. “Nice to be taken seriously, though.”

The door opened, and two guards came in with Colonel Ilich. Their boots squeaked on the tile floor. The guards had their hands on their batons, but they didn’t draw them. Not yet. Ilich put his hand on her shoulder, and she turned to go out. *If he said he was your friend, then he was.* She wanted to believe that, but she didn’t.

“It’s okay,” Ilich said as the cell door closed behind them. “You did well.”

The magnetic bolts shot closed again. Holden was contained. She felt a little calmer. They walked down the hallway past half a dozen more doors like it. If there were people behind them, Teresa didn’t know who they were or why they were there. It seemed like every day revealed some other vast area of things she didn’t know.

Ever since the bad night, she’d felt more than a little like a prisoner herself. Trejo had made her go over everything she knew about Timothy—how they’d met, what he’d said, what she’d told him, how he got along with the repair drones, why she’d never told anyone about him. After hours of it, Ilich tried to call a halt, but the interrogation had gone on until she was weeping and then well past that too.

She didn’t know how long it had gone on. More than one session, but whether that had been hours or days, she couldn’t say. There was a timelessness to everything now. Like it had all just started and also it had all gone on forever. She felt like a puppet of herself, controlled by someone else. Whether she was being badgered by Trejo or sitting with what was left of her father or at meals pretending that nothing was wrong, she felt like her real self had been pressed into a small, black place where her heart should have been. Ilich had talked to her about trauma and violence and promised

her that with time, she would feel better. Cortázar had taken over her medical care, scanning her brain and drawing her blood, but he didn't speak to her much. That was fine. She didn't want to speak.

When she slept, her nightmares were all violent. She never slept without nightmares anymore.

The observation room was a soothing, neutral green. The air smelled of cleanser and the pepper and vanilla of Laconian flowers. Trejo and Cortázar were at a volumetric display that was spinning a complex data pattern like they were watching waves or weather formations. The guards took their places outside the door, Ilich went to stand with the two other men. Teresa thought about going to a chair, but it seemed too far, so she folded down to the floor.

"What am I looking at, Doc?" Trejo said.

Cortázar shook his head. "His response patterns are always a little off. All this noise is within error bars for him. You see something similar in people who've had extensive psychedelics, but usually women. But I'd say changing the questioner didn't affect his readings significantly at all. Given his baseline, I'd say he's telling the truth."

"You're sure about that?"

"No," Cortázar said. "But eighty percent confidence. We should try it with Dr. Okoye next. He has a much longer association with her. And they're friendly."

"If you want to pull her off her present work," Ilich said.

Trejo made an impatient sound and pressed his hands into his cheeks hard enough that his knuckles went pale. There were dark patches under his eyes where the exhaustion was settling in. *He is the only thing holding the empire together*, Teresa thought. It felt like hearing someone else say it. Someone who might be lying.

"Has there been any result on the search for the . . . the body?" Ilich asked.

"No," Trejo said. "I've given the shoot-on-contact order, but I have bigger fish to fry than alien zombies lurching around the landscape. If he

does turn back up, he won't have access to his supplies. Maybe we'll get lucky and the drones will decide he's really a table lamp."

Something moved in Teresa's mind. Something small.

Cortázar grunted. "I think you should reconsider that. Having an additional subject would make my work with the high consul much—"

"We'll wait for Okoye's report before we change any of that," Trejo said. "The important thing is keeping the separatists under control."

"Really?" Ilich said. "I thought the important thing was that something ate our ships and broke Duarte." He meant her father, but that was fine. It applied to her too, and it made her feel like she was more included in the conversation. *Given his baseline . . .*

"That's our second problem," Trejo said, "and we'll get to it. But if I can't keep this together, there won't be anything for the high consul to control when he's recovered."

The hollowness in his voice seemed familiar. Teresa looked at Trejo more carefully. The hours of questioning still left a coloring of humiliation in her, but his weariness and fear weren't hard to see. She'd lost her father. He'd lost his leader. His distress almost made her like him.

Like she'd been hauled back in time, the top of Timothy's head came off. She gasped, and was back in the normal time again. Trauma memory. Ilich had talked to her about flashbacks to moments her brain was having trouble integrating. He'd told her to report if it happened. It happened, and she didn't. Trejo glanced at her, then Ilich.

"You need to get her back to the State Building in time for her peers to see her."

Ilich stiffened. "Respectfully, Admiral? There's more than enough disruption to account for some deviations in the schedule. No one is going to look twice at her being a little bit late to her class."

"That's my point, Colonel," Trejo said, leaning on the syllables of Ilich's rank a little harder to point out the difference. "When everyone thinks the flood's coming up, each little bit of normalcy is a sandbag. She may not be the thing that keeps this from getting out of hand, but she can be

one part of it. And she's finished her part in the doctor's little test with the prisoner. We don't gain anything by having her here."

He meant *We don't gain anything by having you here*. Ilich kept his composure, and Teresa let herself smile.

This new dynamic had come between the men since the bad night. Teresa saw it, even thought she understood what it meant. Ilich was part of the innermost conspiracy to keep her father's condition secret. Trejo had trusted him. And then it turned out that that Ilich had been letting her sneak out of the State Building compound to spend time with an assassin for the underground. Trejo had given Ilich his trust and then found that faith hadn't been justified.

Or maybe it was just that everything looked like that to her now.

"Understood," Ilich said. Then, to her, "I'll take you to the class. It will be all right."

Teresa wanted to burst into tears or scream or drop to the floor and flail like a baby. She wanted to throw a table over and scream the way Elsa Singh had. There were too many years of training and expectation holding her in place. She nodded and rose to her feet. But when Ilich started to walk down the corridor, she didn't follow.

"Eighty percent," she said, turning to Cortázar. "You're sure of eighty percent."

Trejo's eyes flashed a sharp annoyance, but Cortázar seemed happy to answer. "Well, of course that's just an estimate. But autonomic function has been something of a passion for me these last few years, and there's a lot of very good work done on the brain activity that comes with memory as opposed to the activity associated with inventing new information. It's possible that the subject created and rehearsed a set of lies so that's what he's remembering. But since new questioners and novel questions aren't finding any areas that deviate out of recall and into the creative functions, eighty is an estimate. Maybe even a low one. Holden is very probably telling the truth as he knows it."

If he said he was your friend, then he was.

In her memory, Timothy looked up at her the way he always had and said, *You can't have too many tools.*

She didn't know which one she'd been. Friend or tool.

She didn't know, and she needed to.

Peer class was in the State Building's museum. Wide, pale walls with white lights that showed every color in the paintings and sculptures without making them fade over the years. The air was controlled here, neither warm nor cold, neither humid nor dry. Colonel Ilich shepherded them past the great works of other ages like it would be impolite to wake them. He had murdered Timothy, fought with Trejo, carried the weight of the empire on his back, and his smile and voice were exactly the way they always were. She wondered what else he'd hidden from her over the years.

Connor and Muriel were standing next to each other, looking at a canvas of a man painted almost life sized. His hands were open at his sides, his face lifted as if he were staring at something in the sky. Instead of clothes, a silver sheet was pressed to his body, concealing nothing. Teresa stood with her arms crossed. The painting was so detailed, she could see the individual hairs on the backs of the man's hands. It was too perfect to be a photograph.

"It's called *Icarus at Night*," Ilich said. "The painter was a man named Kingston Xu. He was the first great artist of Mars. When this painting came out, he was almost deported back to Earth. Can anyone tell me why?"

Teresa felt the others glance at each other and at her. She didn't know and she didn't care. Her mind felt like it had been sandblasted. There wasn't anything there.

"The sheet?" Shan Ellison said, tentatively.

"Yes," Ilich said. "That's what old medical graft material used to look like. And the man, you'll notice, is dark skinned. The early history of Mars had a great deal of proxy conflict between the nations that had founded different colonies. This model that Xu used was from a place called Pakistan. The artist was from a place called China that was its enemy at the

time. The two were at war. Showing an enemy in an explicitly healing and erotic context was very dangerous, politically speaking. Xu's work could have put him in jail. Or in forced labor."

Or the pens, Teresa thought, but that wasn't right. They didn't have pens before the protomolecule.

"Then why did he do it?" Teresa was almost surprised to hear her voice.

"He thought it was important," Ilich said. "Xu felt that all humanity was part of a single family, and that the differences that divide us are trivial compared to the deep uniting factors that bring us together. That's why your father brought this painting here. The unity of the human project is a Laconian ideal."

It was a strange thought. They were torturing Holden right now over political differences. They'd killed Timothy, and maybe Timothy had come to Laconia to kill them. And now here they were, all pretending that a long-dead man's barely concealed penis was a symbol of how much they were all in it together. This was stupid.

It was worse than stupid. It was dishonest.

Ilich, maybe sensing her mood growing dark, started moving the seminar on to a collection of sculptural abstracts that had only recently arrived from Bara Gaon. Teresa was just starting to walk toward them when Dr. Cortázar appeared, smiling, around a corner.

"Colonel!" the older man said. "Here you are. I was wondering if I could borrow Teresa for a few minutes. Routine medical scan."

It caught Ilich off balance. His carefully built demeanor shifted, and she saw the flash of annoyance in his eyes. Even anger. It made her want to side with Cortázar.

"It's okay," she said. "I can review on my own later."

Ilich's smile slid back into place. "I don't know that—"

Cortázar took her hand. "It won't be long. Right back. Everything fine."

As she let herself be led away, she felt something like joy or anger. A little ember of rebellion still red and hot in the ashes of her world. She tried to hold on to it. Cortázar was humming to himself. He seemed so pleased,

he was almost skipping. She waited until they were safely out of earshot before she spoke.

“Is everything okay?”

“Perfect. Lovely. I have some ideas about what happened. You know. With the high consul. There are some tests I want to run.”

“Baselines?”

Cortázar’s smile widened. “Something like that, yes.”

They walked together through the State Building and to the private medical wing. The guards all knew them. There was nothing that would raise an alarm with anyone. Teresa had to trot to keep up with Cortázar’s long strides.

Nothing felt at all off until they walked into the medical suite—the same one she’d been going to for her annual checkups and occasional maladies for longer than she could remember—and Elvi Okoye was sitting at the doctor’s station. Even then, Teresa didn’t know what was wrong except that Cortázar’s mood soured instantly.

“Dr. Okoye. I’m afraid this isn’t a good time.”

“I found some notes I need to clarify with you,” she said.

“This isn’t a good time,” Cortázar said again, his tone of voice growing harder. The rebelliousness and warmth in Teresa’s chest shifted into something more like dread. She didn’t understand it, but she trusted it. *You should keep an eye on me*, Holden said sometime back in her memory. It was connected to Cortázar’s voice. *Nature eats babies all the time*.

“If there’s something critical going on with Teresa,” Elvi Okoye said, “maybe we should let Admiral Trejo know about it.”

The moment stretched. For a moment, Teresa was back in the cave. Timothy told her to put her hands over her ears. She was breathing too fast. The world started to sparkle at the edges, so bright it was just like darkness.

Cortázar looked at her. “You can go,” he said. “We’ll do this another time.”

Teresa nodded, turned, and began the walk back toward the museum and her peer class with a sense that something important had just happened. Something dangerous. And she wasn’t sure what it was.

Chapter Thirty-Two: Bobbie

C opy copy, *White Crow*. Flight path amended. You good to go, sa sa?”
“Heard and acknowledged,” Bobbie said. “Thank you, Control.”

The tightbeam to Callisto’s traffic control center dropped, and Bobbie shifted the little skiff, feeling the gentle pressure as the thrusters fired. It wasn’t even enough to move her crash couch, but it bent the trajectory of her ship just enough. The display had a hard lockout that let her overlay the path of the whole plan without fear of anything leaking back. Where the *Tempest* was, where the *Storm* would appear, and where she needed to be.

She stretched her hands, and the powered gloves of the Laconian armor shifted with her. Blue showed through gaps in the black paint job. Blue and black were the wrong colors, and always would be for her. Her armor was supposed to be *red*. She opened an encrypted tightbeam and waited the seconds as it was confirmed. Everything was happening so close in, there was hardly any light delay. This wouldn’t be either strategic or close quarters, but the messy part in between.

“Captain,” Jillian Houston said.

“We have approval from traffic control. Monitor our position and stand by for go.”

“Copy that,” Jillian said, and dropped the line. It was good discipline, not leaving the connection up longer than required. Not that it would have made much difference now. By the time the Laconian forces tracked the signal, it would all be over. Or at least too far along to stop.

The *White Crow* was a terrible little ship. Even if Bobbie hadn’t been taking it into combat, she’d have wanted a vac suit buttoned up tight. The cloth covering the bulkheads was pale, with lines of white showing where

age and radiation had degraded it. The crash couches were lumpy and stiff, and slow to react to changes in the ship's vector. The handholds on the walls had all been polished by generations of touching, the way stone steps were supposed to be worn away in medieval cathedrals back on Earth. It was a ship that had outlasted its time, but its drive still worked, and Bobbie didn't need much more than that out of it.

She waited through minutes that felt long as they passed and sudden when they were gone. The outward-pushing, inward-pulling dilation of time before battle. It felt good.

"How are we down there, Rini?" she asked. The response delay from the airlock wasn't much less than when she'd been talking to Callisto.

"I feel like I'm cupping the devil's balls," Rini said. "But . . . yeah. It all looks good."

Bobbie had looked over the torpedo before they'd taken off. It was the smallest and fastest that Bobbie could find, black and boxy and hardly longer than her own leg. Rini had stripped the already spare design down to its minimum, taking away the mass of the traditional warhead in order to win a few extra milliseconds when the burn came. Instead of blowing the little fusion core, the proximity sensor would disable the power that kept the antimatter cut off from the rest of the universe, and physics would take it from there. Bobbie just had to get it close.

She checked the flight path. The *White Crow* was just about where she wanted it to be.

"I'm about to pull the pin," Bobbie said. "If you need a potty break, now's the time."

Rini's laugh was short and humorless. "I've been pissing myself since you told me the plan, Cap. At this point, I'm amazed I don't have a prolapsed bladder."

"Only a little longer," she said, and switched back to the tight-beam. "Status?"

"At your order," Jillian said.

This was the moment. The last moment. Bobbie could pull back now. Take the *White Crow* through her planned flight path, tell her crew to scatter

to the winds, drop the antimatter down Jupiter's gravity well and enjoy the fireworks. There hadn't been a lot of decisive moments in her life that she'd recognized when they were happening. Usually they only came clear after the fact.

"Take her out, *Storm*," Bobbie said.

"Done," Jillian said, the single syllable sharp and hard as a thrown rock.

Bobbie took a deep breath, let it out. Down on Callisto, the *Gathering Storm* was coming to life, breaking out of its hidden berth and leaping through the thin Callistan atmosphere toward the stars. Her crew were being pressed back into their couches like God had His palm on their chests. All she could do was sit and listen to the open channel and wait for someone to notice a drive plume where there shouldn't be one.

The emergency alert cut through the chatter of voices. Military orders to make clear. The thickly traveled Jovian system, with its dozens of moons and millions of people all smashed down into a volume smaller than the slow zone, had just become a battlefield. She fired up the *White Crow*'s drive as if she were going to head for shelter. Her body felt warm and smooth. On her tactical display, the *Tempest* shifted the way it was supposed to, took the vector she'd anticipated, leaped to the attack. When she switched to visual, it looked like a tiny bone, dark against the brightness of its own drive plume.

The display showed fast movers—torpedoes already in flight from the *Storm*. And there, tiny pinpricks of light where the *Tempest*'s PDCs were firing out through holes in its skin-like plating to knock them back. The thin cone of the enemy's blind spot swept across the tactical display. She'd be in it soon. Very soon . . .

"Make safe, Rini," she said. "We're about to get bumpy."

"Not soon enough for me."

The *White Crow* fell into shadow, and Bobbie spun the ship hard, throwing the drive into a hard burn. The crash couch slammed up into her back. Her armor flashed a medical alert error up as her blood pressure fluttered, then took it down when she stabilized. The tactical screen had more targets than she could track. Jillian Houston was throwing everything

the *Storm* had at the *Tempest*, and the *Tempest* was opening up its own volley. But so far no sign of the magnetar field generator, so their dangerous gamble was paying off for now. Bobbie slid the *White Crow* closer in, trying to narrow the gap between her and her enemy. The burn was hard. Her armor rippled down on her legs and arms in rhythm with her heart, pushing the blood along, keeping it from pooling. Even so, darkness started to creep in at the edges of her vision. She was aware of voices on her radio like they were music coming from another room. She was hiding in the middle of the *Tempest*'s blind spot. The safest she could be in the middle of a shooting war, and still not particularly safe.

She shifted to the in-ship comms, and the rest of the universe went silent. "Prepare for launch."

She was pretty certain she heard Rini's grit-toothed acknowledgment. She checked her drive. Seven gs. She'd done worse than seven gs before. Getting old sucked.

She didn't just feel the impact, she heard it, transmitted up through the mass of the ship and into her armor. A deep, dull clank like someone hitting a badly made bell.

"I think we took a hit," she said. "What's your status?"

Rini didn't answer. Pushing against the thrust gravity, Bobbie shifted to the network display. Rini's power armor was still connected, but everything on it was in error states. A sea of red where green should have been. Bobbie shouted the woman's name again, but she already knew there wouldn't be a reply.

The airlock was one deck down and then half a dozen meters from the lift shaft. If she cut the drive, the *White Crow* would fall out of the blind spot and be cut down by the *Tempest*'s PDCs. If the torpedo had broken . . .

If it had broken, she'd already be a rapidly expanding cloud of glowing plasma. The antimatter at least was still intact. That meant there was hope. And if there was hope, there wasn't rest. She slaved the piloting controls to her armor, checked her seals and status—a few medical stats in the yellow, but nothing in the red—and unstrapped from the crash couch. The power armor whined under its own weight as she stood, and she felt her shoulders

trying to dislocate. The blood in her veins slammed down into her legs, and the armor clamped against her thighs, pushing it back up. A wave of nausea almost overcame her. She took the first of eight steps to the lift. She could do it. She had to.

A low growling was coming up from the deck. The maneuvering thrusters were firing. That couldn't be good. She reached the lift, and the slight reduction in g as she went down was like one drop of water to someone dying of thirst. It stopped when the lift did.

The airlock was a mess. Both sets of doors were open, venting the ship into space. The bulkhead was folded where the PDC rounds had hit. Jagged holes gaped where the raw kinetic force had shoved the outer hull into the room. The torpedo was in the far corner where the bulkhead met the floor, and Rini's body was beside it. Bobbie went to her side and knelt, the artificial muscles running through her power armor straining under the burden.

Death had come fast for Rini. She probably hadn't even known it happened. The armor was the same mostly black as Bobbie's, and it was still working hard to preserve the life that was gone. Five holes across her back and arm poured blood too fast, the thrust gravity squeezing it out of the corpse. Bobbie shifted Rini away. There'd be time for mourning later.

Rini had protected the torpedo from the worst of the damage, but the little drive wasn't unscathed. A white impact showed where a bit of shrapnel had cracked the ceramic around the drive cone. Bobbie tried to lift it and see the extent of the damage, but she couldn't. Even with the powered armor, the burn was too much. Her spine ached, and the one rib that dislocated when she was under too much thrust had slipped out of place again. It hurt to breathe.

The *White Crow* threw up a fresh alert. The maneuvering thrusters were at a little under a third of their reaction mass, and requesting permission to start drawing from the reserve. It only took seconds to see the problem. The PDC rounds had sheared off a section of the exterior plating. In a larger ship, it wouldn't have mattered, but the *White Crow* was small enough that

it had shifted the center of mass. The thrusters were firing to keep her from curving off, and would until they ran dry.

She had the ship open a tightbeam to the *Storm*.

“Need good news, Captain,” Jillian said, her voice wet and phlegmy from the pressure of their burn.

“Rini’s down. Ship and torpedo are both compromised. I need you to make the *Tempest* stop. I can do this, but not at high burn.”

There was no response for a second. “How?” Jillian asked, but Alex’s voice cut in on the channel.

“Give me a second, Bobbie. I’ll get you what you need.”

She closed her eyes. Her consciousness was swimming. It was only force of will that made her turn toward the payload. The four little spheres of magnetism, vacuum, and hellfire. The proximity sensor. Neither of them looked damaged. She checked her tactical display. She was still in the blind spot. She rotated the ship and eased back on the maneuvering thrusters. If she was going to fall off course, she could at least fall in the right direction. The *Tempest*’s drive plume swept past, framed in the airlock doors like a comet.

“Alex?” she said. “Give me something.”

And as if in answer, the *White Crow* went on the float. Bobbie rose up, then clamped mag boots against the deck. The *Tempest*’s drive plume was gone. Her blood shifted and the nausea came and went again as she unhooked the warhead and the proximity sensor. The *White Crow* was spent. The torpedo was scrap. She wasn’t done. There was still a way. She took up the warhead, cradling it to her chest, and stepped out the airlock. She didn’t pause as she launched.

Bobbie fired up the thrusters on her Laconian armor and burned toward the *Tempest*. It was an asteroid, a strangely shaped rock curving through a complex orbit around the small and distant sun. She was close enough to see it without enhancement. Much closer than she’d intended. Maybe a hundred clicks away. Maybe less. A machine that had brought the solar system to its knees. The unkillable dreadnought of Laconia. And somewhere beyond it, away to her left, the *Storm*. Her ship. They weren’t

really stationary. Nothing in the universe was. It was only that their vectors matched for the moment. Stillness was an illusion.

Something flashed and was gone. A torpedo taken out by the *Tempest's* PDCs. Against the constant and unwavering starlight, the little glimmer of motion stood out. She saw another. A handful more. And the arcing brightness of the *Tempest's* torpedoes heading out. The distances were so vast, they almost looked slow.

"Hold on," she said, but she didn't turn her comms on. It wasn't a message so much as a prayer.

Bobbie checked her tactical display. She was still linked to the *White Crow*, but the comms on the little ship weren't the best. It took almost a second for the full layout to repopulate.

Going ballistic was hard. The warhead in her arms was a dart, and she was trying to drop it a kilometer and land it in a coffee cup. She checked her suit, and the thrusters were good, even if they were running through her fuel way too fast. The *Tempest* was a little larger now. She killed the burn and turned, centering it between her feet. Falling toward her enemy from a great height. She held the warhead against her belly, checked the connections and readouts one last time. Was the power cut off engaged? Yes. Was the backup battery disconnected? Yes. Was the proximity sensor set so that the ship would trigger it? It was.

Bobbie took a deep breath. Another. That rib popped back into place with a deep and painful snap, and she grinned. The *Tempest* was visibly larger now. Her velocity toward it was recklessly fast, even though she could hardly feel it. She eyeballed her path, adjusted, had the suit double-check her. An augmented line from her armored toes down to the *Tempest*. She took a solid hold on the warhead, one hand on either side, and then carefully let go. Even a tiny variance, amplified over the quickly falling distance, would be a disaster. She waited for a long moment, and it floated in place, almost touching her. No drift. Perfect.

Gently, she tapped her suit thrusters, drifting away centimeter by centimeter, careful that the little plumes didn't touch the warhead. When she was four or five meters away, she started a braking burn, and the

warhead seemed to leap away. Her breath sounded very loud in her ears. Very close. Her suit was running warm, the radiators doing their best to shed waste heat. The vacuum of space was only cold after you were dead.

It was too late for her. Some part of her had known that from the moment she'd seen the white mark on the torpedo, but now that it was done, she could think about it. If things had gone right, she and Rini and the *White Crow* would have been burning hard as hell away from the *Tempest* the moment they dropped their missile, trying to outrun the blast. And that had assumed the *Storm* was still leading the enemy away, which wasn't happening either. So this was it.

She twisted at the hips, stretching. The stars of the galactic disk spread against the horizonless sky. Some of that light had been traveling for centuries. Millennia. Longer. Many of those stars would have died long before she was born. What a weird fate for a photon to be spat out of a nuclear fireball, speed through the vast emptiness between stars, and land on a Martian Marine's retina while she decided whether she still feared death, or if she was ready. She'd done this a dozen times before.

The *Tempest* was getting larger. She hadn't killed all her velocity toward it. She wondered whether the *Storm* would make it. In a straight battle, it was doomed. Jillian and Alex and the rest were doing the tactical equivalent of taking a ship like the *Rocinante* and picking a fight with a *Donnager*-class. As long as the *Tempest* didn't fire up its drive, it would be worth it. Pyrrhic victories were still victories, and this was about to cost the enemy way more than it would her.

She thought about making a connection back to the *Storm*. Saying goodbye. They didn't need the distraction. If anything, she should try to divide the enemy's attention, not her allies'. Anything else was self-indulgence. She'd taken her shot, but she wasn't done.

She checked the ammunition levels in the suit. She was topped up. The thrusters still had some juice in them, and her oxygen was good for another thirty minutes, even if she didn't start running it thin. She engaged the weapons, shifted her HUD to local/tactical, and grinned. *Who am I? Did the*

things I accomplished matter? Will I leave the universe a better place than I found it? If I don't come back, what are my regrets? What are my victories?

"Thanks for everything," she said to the universe, as if it had been the host of a particularly good party that was just winding down. She turned toward the *Tempest*. Another sparkle of light. Another volley of torpedoes speeding out into the darkness. Another threat to her ship and her people. "All right, motherfucker. You want to dance? Let's dance."

She locked her targeting system onto the Laconian battleship, shifted her suit to live fire, and started her burn. Fifty-seven seconds later, she passed out of the *Tempest's* blind spot.

Chapter Thirty-Three: Alex

Status?” Bobbie said. Her voice on the command deck only made Alex feel her absence more. All around, the others were at their stations. The tension in the air was thick. Every glance, every breath, every nervous chuckle meant the same thing: *Holy shit, we’re actually going to do this.*

“At your order,” Jillian said, tugging the collar of her uniform open another centimeter. Alex remembered being young enough to care what he looked like going into a battle.

Caspar was tapping the side of his crash couch. Jillian leaned forward on hers, pulling the restraints tight against her shoulders. Alex sort of wished he’d hit the head. Everyone dealt with the anticipation and dread differently.

They’d been preparing for hours, towing the *Storm* out from its hidden mine, making the cabins and workshops secure, running every system through its diagnostics. Now the only thing between the *Gathering Storm* and open space was a set of old bay doors, and Bobbie’s go order.

“Take her out, *Storm*.”

“Done,” Jillian said, and cut the connection. “Kamal. Take us out.”

Alex tapped the release and watched on his monitor as the doors above them opened. Maneuvering thrusters gently pushed them off the moon’s surface. And as soon as the *Storm* cleared the dock, he lit the Epstein up. He fell hard into the crash couch gel, feeling the coolness as it crept up around his ribs and neck. Callisto fell away behind them, the surface glowing orange and gold where the drive plume had heated it.

“All systems inside tolerance,” Caspar said, even though no one had asked. The kid had to do something. “We are . . . Okay. I’m getting a

connection request from Callisto traffic control?”

“Let ’em wonder,” Jillian said. “Do we have the *Tempest*?”

“Got him,” Alex said.

“Show me.”

Alex threw the Jovian system onto the main display. Their position, the moons, the curving arc of the gas giant below them. The shipping patterns were complex to an untrained eye, but he could read them like text. The freight traffic in gray, Laconian security in gold. Bobbie and the *White Crow* in green. And the target—the *Tempest*—in red as bright as fresh blood.

The shifting gravity of the system made lowest-energy transit lines, and the traffic between the moons followed them like iron filings showing a magnetic field. At these distances, you wouldn’t even need an Epstein drive to ignore them. A decent ship flying teakettle could get anywhere it needed to be. It was only the extra scrip that ships could save that made the pattern what it was. That was always enough.

“Come on,” Jillian said, not to anyone on the bridge. “Grow some balls and come get me, you big bastard.”

“Security alert’s just gone out, open channel,” Caspar said. “They know we’re here. The *Tempest* is moving. She’s coming after us.”

“Punch it, Kamal,” Jillian said. Her bravado was almost convincing. Alex didn’t think Caspar saw through it.

Alex punched it. On his monitor, the green of the *White Crow* lined up just where he wanted it to be. The *Tempest* followed in the way he’d expected it would. His jaw ached from the thrust, and the juice running through his system made him feel like he’d had too much coffee and not enough at the same time. The *Tempest* was a massive ship, but the drive was powerful enough that inertia didn’t matter much. The *Storm* was smaller, lighter, and less powerful, and while it was probably more maneuverable, that didn’t help this time. If he was going to get Bobbie through the eye of that particular needle, he had no degrees of freedom.

They still had advantages, though. The main one being that they were ahead and the *Tempest* was behind. The *Storm*’s drive plume gave a little

cover. The torpedoes that the *Tempest* fired would have to swing out and around to keep from getting slagged. And it also had catch up to the *Storm* as it sped away. Anything the *Storm* launched, the *Tempest* would rush forward to meet. It gave the *Storm*'s PDCs that little extra slice of reaction time, the *Tempest*'s that much less. Bobbie's flight plan for him had been to ride that gap where the difference put the *Tempest* in threat and the *Storm* just outside it. It was great in theory. Practice was more complicated, because they could still be overwhelmed.

Would be.

"Fast movers," Caspar gasped. "That's a lot of them."

Jillian coughed. It sounded painful. Alex half expected her to move to text communication, but she fought through and spoke aloud. "PDCs to auto. Return fire."

The thrum of the PDCs added itself to the noise and shudder of the pursuit. Like a kid trying to outrun a cop, the *Storm* slid past the *White Crow*, and the *Tempest* boiled up from below her. Alex couldn't tell if the vibration was engine harmonics coming from the deck or his overloaded bloodstream or both. Bobbie's little ship hit her burn too, falling into the enemy's blind spot.

Soon. It would all be over soon. He forced himself to swallow. It hurt.

The *Storm* shook. "We aren't hit," Caspar shouted. "It was close, but we got it."

"More distance, Kamal," Jillian said, but he couldn't do that without prodding the *Tempest* to match. Bobbie needed the battleship to keep its current course and heading. He was too focused on the reality of the situation to explain why it was a bad order, so he just ignored it. If the *Storm* had to take a few hits, it would just have to take them.

The incoming fire was like a vast, blooming flower. Lines looped out from the *Tempest*, curved in toward them, and vanished as the *Storm* knocked them back. Alex spared a glance at the ammunition levels. They weren't as low as he'd expected. All his habits had been formed on older technology. The Laconian design for rapid printing of new rounds still wasn't intuitive.

If they had been doing what they appeared to be doing—running like hell and hoping to get to the gate and out of the system—it would have been a desperation move. The distance between Jupiter and the ring gate was vast, and the *Storm* was constrained by both its reaction mass and the fragility of the bodies inside her. And the danger of screaming through the slow zone too fast without knowing the state of play on the inside. Alex would have had to make a braking burn before they reached the gate, and the *Tempest* would have caught them. If Bobbie didn't come through, it could still go down that way. Alex realized he was already plotting in other plans—dive into the high atmosphere of Jupiter and try to scrape the *Tempest* off, loop sunward and try to get the enemy to overheat and pull back before they had to—and stopped himself. They weren't in the last ditch yet.

"New volley coming in," Caspar shouted. "We're not going to be able to stop them all."

"Evasive, Kamal," Jillian snapped, and Alex bent their flight path away, but only a little. The *Tempest* couldn't turn or shift without exposing the *White Crow*. And where the hell was Bobbie anyway?

"Brace," Caspar said, and a second later the crash couch bucked under Alex, kicking him like a mule. Even with the gel to pad him, he fought to get his breath back. He'd lost a couple of seconds. They couldn't afford that again.

"What's the damage?" Jillian croaked out, but no one answered.

The tightbeam sprang to life. Bobbie was checking in.

"Need good news, Captain," Jillian said. Her face was shining with sweat. Alex waited with dread and hope.

"Rini's down. Ship and torpedo are both compromised," Bobbie said. Her voice was strained, but with the calm professionalism of a woman in her natural environment. She'd have had the same tone if she'd just found the way to destroy her enemy or lost both her legs. "I need you to make the *Tempest* stop. I can do this, but not at high burn."

The pause seemed to last forever. Alex plotted in the flip and burn, and waited for Jillian to give the word.

Instead, she said, "How?"

"Give me a second, Bobbie," Alex said. "I'll get you what you need."

The drive cut off, the weight of acceleration vanishing in the time it took to blink. Alex took the comm control from Caspar and turned on the do-not-approach beacon. Tactically, it didn't make any damned sense. That's what he was counting on.

"What are you doing, Kamal?" Jillian said. Her tone was halfway between outrage and hope that maybe he knew something.

"Making us look like a mutiny," he said. "Seeing whether they like the idea of getting their ship back."

As he'd hoped, the *Tempest* killed its drive. They sped through the darkness in matching orbits. Callisto was already long gone behind them. Even Jupiter was visibly smaller. It felt like being alone, but every eye in the system would be watching them.

"Leche bao," Caspar said under his breath. "They're going to kill us."

"As long as they do it without starting their drive up," Jillian said, and Alex felt a little burst of pride for the girl. She was green, but she was learning. For almost a minute, the two ships stood silent, waiting, and tense. A comm request came in from the *Tempest*. Jillian didn't accept it. Alex noticed he was holding his breath.

"Fast movers," Caspar said.

"Shoot down as many as you can and return fire," Jillian said, "but do not change course, and don't give them a reason to."

Alex could only watch as the crew fired back. It would be over already if the command staff of the *Tempest* had wanted it to be. A single massive strike, and the *Storm* would be dead. Instead, like a wrestler slowly bending back the opponent's joint, they were pushing the flow of missiles, a little faster and a little faster until the *Storm's* defenses were overwhelmed. They wanted to disable the ship and question the crew. They hadn't met Bobbie. Or Jillian Houston. If it came to it, they would scuttle the *Storm*. He knew he was looking at his own death.

Come on, Bobbie, he thought. I'm trusting you on this.

"I think . . . Is that the captain?" Caspar said. "I think that's the captain."

He threw the feed from the external sensors onto the main display. The image was a little shaky, the edges too sharp, but there not far from the *Tempest* was a single figure in power armor falling in toward the ship. Its arms ended in the rapid-fire glitter of muzzle flash, throwing two streams of ineffectual rounds at the mass of the Laconian dreadnought. The sight of a single human-sized figure flying past the battleship gave a dramatic sense of scale to its massive bulk. Next to it, Bobbie looked like an angry insect attacking a whale.

“Keep your eye on the incoming missiles,” Jillian said. “If that’s Draper, she’s doing it for a reason.”

The tiny figure flew a jagged, unpredictable path. Streams of high-speed projectiles chased it as the *Tempest*’s PDCs tracked it. The flyswatter hunting the fly. It was impossible to imagine that something so small could stand a chance against the vastness and power of the ship, but if it was Bobbie it was also impossible to imagine she wouldn’t.

Alex started laying in a burn solution. “I can get to her,” he said. “It’s going to mean getting damned close to that thing, but . . .”

The figure twitched. Something bloomed out from its back. On the display, it looked so small. The arms rose up, the legs bent. Vapor sprayed from the figure. Atmosphere. Blood.

“She caught a PDC round,” Jillian said. “She’s gone.”

Alex didn’t hear her. He heard her, but he wouldn’t understand. Grief like an electrical shock ran through his body, humming and violent and damaging.

“I can get to her,” Alex said, turning back to his controls. Something was wrong with the juice on his couch. He couldn’t catch his breath. “It’s going to be a hell of a ride, but we can . . . we can . . .”

His controls flickered as Jillian locked him out.

“Give me the *fucking* controls,” he shouted. “We have to get her!”

“Alex,” Caspar said, and his gentleness was unbearable. The suit of powered armor drifted. It was still heading toward the *Tempest*. Inertia carrying her toward her destination even after it didn’t matter. Even after

she was gone. He tapped at the controls the same way, like there was a way to roll time back just a little.

“Fuck. *Fuck*,” Alex shouted. The lemony taste of vomit hit the back of his throat. He swallowed hard, forcing it back down. The plan had failed.

Bobbie was gone.

“What do we do?” Caspar said, and there was panic in his voice. Before Alex could answer, the sensor feed died with an audible click and the radiation alarms started screaming.

The *Heart of the Tempest* had stood alone against the combined forces of Earth, Mars, and the Belt and won. It had put all humanity under Laconia’s yoke. It was the living symbol of why all resistance against High Consul Duarte would always be in vain.

When their sensors finished their override reset, it was gone.

Without the protection of the *Storm*’s eerie skin, the burst of X-rays and gamma radiation would have killed them all. As it was, half the crew was too sick to get out of their crash couches. The medical bay was filled with people sloughing off the lining of their gastrointestinal tracts. The ship’s supply of antiradiation pharmaceuticals was already down to nothing, and if the cancer rate followed the models, their oncocidals would be going down next.

The ship itself was injured too. Not even broken. Injured. The regenerative plating that covered the *Storm* had started developing blisters and thickening like the first stages of skin cancer. The vacuum channels that routed power failed sometimes for no clear reason, becoming so unreliable that the repair crews started putting in copper wire backup circuits, the metal taped to the inside of the corridors. The drive still burned, even if it ran a little dirty.

They’d won. It hadn’t been possible, but they’d done it. Coming out unscarred would have been too much to ask.

Alex cycled between numbness and grief with the regularity of a clock. When he could stand it, he watched the newsfeeds from around the system replaying the explosion he hadn't been able to see because he was too close when it happened. The best one was from Earth. A handheld camera filming a child's kite competition was pointing at the right section of sky when the light reached there, and the brightness against the blue had been like a small, brief sun, even at that distance.

Everyone in the system was tracking the *Storm* as it made its way toward the ring gate. No one had the nerve to follow it. The newsfeeds were thick with analysis. The attack had been in retaliation for the crackdown on Ceres. It had been an inside job, and stood as evidence that the Laconian Navy itself was rife with factions and dissent. It was the first step toward the underground retaking Sol system or the inciting incident that would force the high consul to glass the whole system. Nine times out of ten, the speakers were celebrating Laconia's defeat. There were other stories: Spontaneous demonstrations on Mars and Rhea calling for Laconian withdrawal. The official announcement from TSL-5 that the Laconian political officer's position was being held empty until regular communication through the gate network was reestablished. A dozen pirate feeds springing up, accusing the Laconians of taking risks in the dead systems that put the whole human race under threat.

It wasn't chaos, or if it was, it was no more than usual. It was the blossoming of hope where there had been no hope before. It was everything Bobbie had intended it to be, except for one detail.

For himself, the radiation sickness was bad, but the physical distress at least kept his mind busy. When he felt well enough to work, he threw in with the repair crews. He wasn't surprised when Jillian Houston—Captain Houston—called him into her office. He'd been expecting it.

The cabin was small and spare. Laconian officers didn't show off. Another thing they'd inherited from Mars. Alex remembered his own commanders embracing the same austerity, back when he'd been a different man and the universe had made sense. The few decorations and belongings that had been Bobbie's were on the desk. Jillian looked thinner than before,

and paler too. The radiation sickness had hit her harder, but it hadn't stopped her.

"Alex," she said. Her voice was gentler than usual. Like now that she'd taken power, she didn't have to be as aggressive. "I wanted you to . . . I thought she'd have wanted you to take care of her things."

"Thank you," Alex said, reaching for them.

"Please sit."

He did. Jillian leaned forward, her fingers steepled. "We need repairs. We need to regroup. And we need to go to ground before Laconia gets their shit together and sends ships after us."

"All right," Alex said. His heart wasn't in it. Maybe it was because he was sick. Maybe it was grief. Where one started and the other stopped was difficult if not impossible to locate.

"I've decided to take us back to Freehold. We have the support there. And the *Storm's* home base facility. We can get her back up to trim. Resupply from the colony. Plan our next moves."

She looked at him like she expected him to say something. He wasn't sure what that would be. He considered the things on the table. A tunic. A little glass-and-ceramic commendation she'd gotten from the UN, signed by Chrisjen Avasarala. He was surprised there wasn't more, and he was a little surprised there was even that much.

"I think that's a good plan," he said. "The risky part will be getting through the gates, but with no Medina Station, we don't have to try to sneak out in a supply ship. That makes it easier."

When Jillian spoke again, there was a thickness in her voice like passion or sorrow. Or rage. "Draper was a good captain. And a better war leader. She made this ship what it is, and no one on the *Storm* will ever forget her or the sacrifice she made for us."

"Thank you," Alex said.

"I need to make this my ship now. In her tradition and her honor, but my command. I wish it wasn't like that, but it's where we are. You understand."

"I do."

"Good. Because I need you as my XO."

Alex looked at her. He knew the answer and what he was going to do as clearly as if he'd actually been thinking about it. All his next steps laid out before him.

“Thank you,” he said. “But no. This is your ship, and that’s the way it should be. I’ve got one of my own.”

Chapter Thirty-Four: Elvi

Elvi woke up gasping.

“Hey hey hey,” Fayez said, shifting in the bed beside her. His hand on her back grounded her. It made the dream scatter back a little. She leaned into it. “Nightmare?” he asked.

“Worse,” she said. “You know that dream where you’ve got the big presentation that you forgot about, and now you have to pretend you did eight months of work on something you’ve got no clue on?”

“That is your go-to for bad dreams.”

“That, except that usually when I have it, I just have to wake up and things are better,” she said, smoothing back her hair. “I’d give three fingers and an eye to only have a blown lecture to worry about.”

He shifted, the familiar warmth of his body moving alongside her. “How’s your gut?” he asked. And then, when she didn’t answer, “You need to eat, darling.”

“I do. I will. It’s just . . .”

“I know.”

She reached for her cane, but when she stood, she put more weight on her hurt leg. The pain felt right. She went to the bathroom first, then started pulling on clothes. It was still dark out, apart from the lights of the State Building, the glow of the city, and the construction platforms glittering against the stars.

“Come back to bed,” Fayez said. “It’s too early.”

“I’m not going to sleep anyway. I’ll go out to the university. Get a jump on the day.”

“You have to get some rest.”

“Rest for me,” she said, and kissed him on the cheek, and then again on the neck. They were still for a moment.

When Fayez spoke, his voice didn’t have its usual lightness. “I will find a way to get us out of this if I can.”

“Out of this?”

“The part where you’re surrounded by psychopaths and politicians. We’ll steal a little ship, head out to some backwater colony world and spend the rest of our lives trying to get cucumbers to grow in poison soil. It’ll be great.”

“It would be heaven,” she said. “Go back to bed. I’ll come back when I can.”

The State Building was almost pleasant at night. Something about the quietness made it seem like she had freedom. There were just as many guards, just as many surveillance drones. Maybe it was just millennia of evolution priming her brain to believe that what happened in the darkness was hidden, private, and peculiar. She stuffed her hands in her pockets and went to the commissary. There would be something there—coffee and sweet rice, if nothing else. She couldn’t keep much more than that down anyway.

The work in Cortázar’s lab was punishing. There were a couple of decent virtual context translators in the lab. They helped enough that when his notes were couched in terms of nanoinformatics—complex imaginary information loss, Deriner functions, implicit multipliers—she could understand it in exo-biological terms like functional regulation site persistence across generations. How either or both of them would ever be able to make the issues clear to Admiral Trejo, she couldn’t imagine. But she’d been able to explain convergent evolution to undergraduates, once upon a time. So maybe she’d come up with something.

The commissary was bright and quiet. An attendant nodded to her as she entered. Or maybe he was a guard. Same thing. Elvi got herself a cup of tea—the coffee smelled too acidic and aggressive when she got close to it—and a bagel with butter and jelly. She didn’t want to go to the pens or Cortázar’s private labs. She didn’t want to spend another day with Cara and

Xan. She also didn't want to stay here. But most of all, she didn't want to do what she knew she had to do. Tell Trejo about Cortázar.

She'd wanted to find proof. A smoking gun somewhere in his notes. She'd gone over everything she could find about Duarte's transubstantiation—her term for it, not theirs—hoping to find something that showed Cortázar didn't intend to let Teresa follow in her father's footsteps, and that he never had. There was nothing. Either he'd never put it in his written musings or he'd erased it carefully enough that she couldn't find it.

Her hand terminal had a reminder function. It was meant to alert her when meetings were about to start, and one of the options was to let her know when the other people were already together. She'd made a fake appointment with Cortázar and Teresa with an unfixed time. It meant that anytime the two of them were in close proximity, she was notified, and would be until one of them noticed it on their schedule and wiped it out. She was almost certain that her unexpected appearance at the medical wing was the only thing that had kept Cortázar's work with Teresa from moving forward already.

And by *work*, she was pretty sure she meant vivisection.

She finished the last bite of bagel and washed it down with the dregs of her tea. It was still hours before daylight. If she waited, her courage would fail her. She cleaned up her plate and teacup, stretched until her leg ached, and went to the attendant.

"Can I help you with something, ma'am?"

"I need to talk to Admiral Trejo."

Trejo was dressed when she reached his office. His bright-green eyes were puffy with lack of sleep, and his shirt had the limp look of something worn for too many days in a row. His desk held a pile of exhausted single-use displays, the detritus of a flood of highly sensitive reports from inside the system and what he had managed to glean from all the systems beyond. His smile was warm, well practiced, and probably insincere.

Elvi had been laboring hard under the strain of juggling a mad emperor, a murderous scientist, and civilization-ending monsters that had killed her crew and eaten her flesh. It was uncomfortable to think that Trejo was under more pressure than she was.

“Doctor,” Trejo said. “You’re up early.”

“So are you.”

He gestured to a chair. “I’m up late. Coordination with the other systems has been . . . challenging. I delegate what I can, but the high consul didn’t sleep, and being both him and myself has been . . . strenuous.”

“When was the last time you slept?”

“A full night? Honestly, I’d have to do some math.”

Elvi sat, folding her hands together on her knees. The anxiety hissed and spun in her chest like a firework. Sleep seemed like something in a language she couldn’t speak. Neither of them knew what the term meant anymore.

“Is there something I can do for you, Dr. Okoye?” Trejo prompted. Elvi realized she’d faded out for a moment.

“I don’t have hard proof,” she said, “but I believe Dr. Cortázar intends to harm the high consul’s daughter. Maybe even kill her.”

Trejo sighed and looked down. Elvi steeled herself. She was aware how thin her argument was. Even if Holden had come right out and made the accusation, it wouldn’t have carried much weight. Her trust in him would do more to undermine her own status than to dignify his report. All she had was the bone-deep conviction that it was true. She was prepared to plant her flag there and defend her position until Trejo took her seriously.

She expected him to say *What evidence do you have?* or *What makes you think that?* or *Why would he do that?* Instead, the admiral stretched his neck to the side until it popped. “Has there been any change in the high consul’s condition?”

“Not that I’ve seen,” she said. “But—”

“What options do we have for bringing him back to himself?”

“I don’t know. I honestly don’t know if that’s even possible.”

“We did the thing in the first place,” Trejo said. His voice was getting a rasp to it. Frustration or fear or anger. “Why can’t we undo it?”

“The same reason we can’t stir milk back out of coffee or unscramble an egg. Physics is full of things that only work in one direction. This is one.”

“Can we regenerate his central nervous system the way we would after a head injury?”

Elvi felt confused. She’d imagined several versions of this conversation, but none of them had involved ignoring her fears and changing the subject. She wasn’t sure what to do.

“Well, um . . . it’s not exactly like that. The cells in his brain are all still intact. Cortázar changed the way they function. Regrowing tissue means finding areas that are compromised and encouraging new cells to build there.”

“If we intentionally damaged his brain and pumped in normal cell lines, would he grow back?”

“I’m sorry?”

“Burn out his hippocampus, regenerate it. Then his occipital lobe or whatever. Go through him part by part, kill what’s there and replace it with fresh tissue that works like normal human flesh, and build him back up that way. Would that work?”

“I . . . I don’t know,” Elvi said. “That’s the Ship of Theseus question. Whether, when you replace all the individual parts of something, you still have the same thing. That’s philosophy. But even then, regrowing central nervous systems is tricky work. We’d want to talk to medical doctors. Physicians. I’m a biologist.”

“Cortázar did it.”

“Cortázar is deeply, *deeply* ethically flawed,” Elvi said. “I’m pretty sure he was using Duarte as an animal model to work the kinks out for his own treatment in the future, and I think he’s planning to sacrifice Teresa too. That’s what I’m here telling you.”

“What about the things that attacked the ring space? Can we say definitively whether they do or don’t pose an ongoing threat? If I park

another ship where Medina used to be, is it going to get eaten? Or are we safe as long as we don't blow up any more neutron stars?"

Elvi didn't mean to laugh. It just happened. Trejo's professional demeanor slipped for a moment, and she saw the rage and despair underneath it.

"How would I possibly know that?" she said. Her voice was louder than she'd meant it to be, but she didn't rein herself in. "I don't know what they are or how they ate the ships they did. Have we had reports? Do we have data? I can't do anything but speculate without that. And what does any of that have to do with Teresa Duarte?"

Trejo went to his desk, called up a fresh window, and shifted it to her hand terminal. She looked at the images there. She recognized the *Heart of the Tempest*. It was the most iconic Laconian ship there was. The images had the hyperreal quality of optical telescropy that had been stabilized and enhanced. A few glittering sparks appeared around it.

"Was there a battle?" she asked, and the image went so white that even coming from the small screen it hurt her eyes.

"It's already known through the Sol system. It will be known through the whole empire. The *Tempest* is dead. A separatist terror cell stole secret Laconian technology and used it against us. And now I have one *Magnetar*-class ship, thirteen-hundred-odd ring gates to keep control over, and the one place where it could actually do that is haunted by . . ." He gestured at her leg. *Whatever the fuck did that.*

"I see," she said.

"We haven't been able to keep signal repeaters up. Every time I send them out, some rock thrower knocks them back down. The terrorists are sending messages to each other through the gates using the technological equivalent of tin cans and chewing gum, and I can't stop them. If I can put a fleet of ships into the ring space, I control everything because it's a choke point. It's *the* choke point. If I can't do that safely, I can't control the empire."

"Except if—" she began, but Trejo couldn't be stopped. His words were like an avalanche. Once they'd started, they kept going.

“Everyone—*everyone*—on every ship and station and planet is going to be waiting to see what the high consul does. And right now he’s two hallways over, waving his hands like a fucking undergraduate on his first hallucinogenic trip. Governments exist on confidence. Not on liberty. Not on righteousness. Not on force. They exist because people believe that they do. Because they don’t ask questions. And Laconia is looking down the throat of a lot of questions we can’t answer.”

By the end of the speech, his voice had risen. Grown strident. Elvi had the sudden and vivid memory of being a girl in Karhula. The manager of the grocery she and her father went to every week had found out the rent on the property was going up, that he was going to have to move or shut down. He’d had the same tone of voice, the same sense of having been overwhelmed by events, the same anger in the face of implacable reality. There was something weirdly comforting about the idea that a humble grocer and the most powerful man in a galaxy-wide empire could have something so fundamental in common. Without thinking, she reached out and took Trejo’s hand. He yanked it back like she’d burned him.

It took a couple long, shuddering breaths for him to regain his composure. When he spoke again, it was the Trejo she recognized. “Your problem, Dr. Okoye, is that you think the immediate problem before you is the most pressing one. It is not. Whatever else Paolo Cortázar may be—and I have no illusions about that man—he is also indispensable.”

The silence between them stretched out longer than was comfortable. Elvi felt like she was looking over the lip of a cliff she hadn’t understood she was standing on. “You’re telling me it’s okay with you.”

“I will try to keep guards on the girl,” Trejo said. “I will do what I can to make sure the two of them aren’t alone together.”

“But if he comes in here with her head under his arm, you’ll shrug and let it slide?”

Trejo spread his hands. “If he says he can fix this clusterfuck by sacrificing her, I’ll find him a knife. That is my duty. I am an officer of the Laconian Empire,” he said. Then, a moment later, “As are you.”

The air in the room seemed thin. Elvi was having a hard time catching her breath. Either Trejo didn't see her distress or he chose not to.

"Your focus, Dr. Okoye, is to provide a second set of eyes and experience as a help to Dr. Cortázar. You and he are partners in this. There is no daylight between you. If you find that difficult or distasteful, I don't really care. We are at a critical moment in history, and you must rise to this occasion."

"She's a kid," Elvi said.

"I agree it would be better if she lived. I'll do what I can," Trejo said. "But there can't be any misunderstanding between us about what our priorities are. The sooner you and he find a way to stir the cream back out of this coffee, the sooner she'll be safe. Anything that impedes the efforts to heal Winston Duarte is your enemy. Anything that helps is your friend. Are we clear?"

I resign floated at the back of her throat. She could feel the words like they were something physical. She knew the shape of them. And she knew Trejo wouldn't let her quit. Where she was now, there was no coming back from.

"As clear as an unmuddied lake," she said. "As clear as air."

"Thank you for your time, Doctor. My door is always open to you."

It was, she thought, an ironic way to tell her to leave.

She rose and walked out into the hall, and then the wide lobby, and then the darkness of the gardens. In the east, the first hint of dawn was turning off the dimmest stars. The air smelled like burnt cinnamon. It was the mating display of a species of ground-dwelling grub-like animal native to Laconia. On Earth, it would have been birdsong. She stood for a long moment and breathed it deeply.

She had done fieldwork for decades, traveling to new worlds with her sample bags and testing kits. She was probably the only person living who had seen as many different trees of life as she had. All the numberless different solutions that evolution had come up with under all the different stars, and all responding—more or less—to the same pressures. Eyes on every world, because things that sensed light were more likely to survive.

Mouths near the sense organs, because things with feeding coordination did better than things without. She'd probably killed and dissected representatives of more individual species than anyone in history in the name of science. And still, she didn't think of herself as a killer. As complicit in murder. As monstrous.

On the horizon, a plume that looked almost like smoke but was really millions of tiny, green-bodied, screw-shaped worms rose up into the sky and then flattened. They shimmered in the rising brightness, a bioluminescent display. Nature was beautiful, wherever she found it. And it was cruel. She didn't know why she kept expecting humanity to be different. Why she pretended the same rules that applied to mountain lions and parasitic wasps didn't also constrain her. Red in tooth and claw, and at every level. In the Bible, even angels murdered humanity's babies when God asked them to.

The swarm on the horizon finished advertising its quality as a mating cluster, the light going out, their bodies going gray. The clouds took on the pink and red of any planet with enough oxygen to selectively scatter the shorter wavelengths. The cinnamon smell grew stronger.

"Good luck, little grubs," she said. "Hope it works out for you."

She headed back into the State Building and then through to the other side of the compound, where a car was waiting for her. She got in without exchanging pleasantries with the driver, and they headed out into the great city where lights were just turning off as the sun rose. High-rises and streets and warehouses and theaters, all of it reminding her of nothing so much as a huge hive.

At the university, she walked herself from the parking structure to the Pen. Cortázar was sitting on a bench outside the windowless cube, a cup of coffee in one hand and a corn muffin balanced on his knee.

He smiled to her as she came close. "Beautiful morning, isn't it?" he said.

He had dark eyes. His cheek was brown, stippled by white stubble where he hadn't shaved. He looked like someone's chemistry professor, not a monster.

“We should get to work,” she said.

Chapter Thirty-Five: Naomi

For all Naomi's life, the problem had been knowing which information to believe. A few billion people with access to networks and as many newsfeeds as there were transmitters made it easy to find someone loudly declaiming every possible opinion in every corner and niche of the solar system. And once the repeaters were up, information came to and from the distant worlds beyond the gates with a light delay of only hours. To understand her new reality, she had to find models in ancient history, when the living voice or marks on physical media were the only means of storing and moving information. Ancient North America had used something called the pony express. A series of carts and animals that hauled written information across the then-vast deserts. Or that was how she understood the process, never having seen a pony or a handwritten letter on paper. Now the ponies were ships and torpedoes, the letters were compressed data bursts, and the deserts were the hard vacuum of space and the emptiness of the gate hub at its center. The effect, though, was that news of the far worlds came unreliably. The events on Auberon and in Auberon system took on an exaggerated importance because she knew about them immediately. Anything going on in Bara Gaon or Laconia or Sol, Freehold or New Cyprus or Gethen, became foreign and exotic by being rare. The discovery that "two gates lost" meant that the Thanjavur and Tecoma gates had been destroyed and the systems behind them stranded only added to the sense of vast things happening, far away. The universe had expanded again, and all the things that had been close were once again much more distant. The reports that did come through were precious as air on a leaky ship.

And so, when word came from Sol that the *Tempest* was dead, it felt like a revelation.

It didn't come from underground sources. Bobbie hadn't sent a report, or if she had, the bottle had been lost in transit or slowed to the point that the civilian news outpaced it. The first Naomi heard of it was on Laconian state feeds run by the governor. The tone of the report was outraged and meant to inspire fear. Terrorists had murdered a Laconian diplomat and stolen military technology which they'd then used to slaughter the protector of Sol system. The danger of chaos and riot in Sol system were, to listen to the feed, apocalyptic. Laconian forces were gearing up to protect innocent civilians from the waves of reprisals and violence that were sure to follow.

Probably it had sounded persuasive to Laconian ears. The bone-deep assumption that all things Laconian were good and all opposition evil made for a hell of a blind spot when it came to writing propaganda. For Naomi and Chava it was the resolution of an uncertainty they'd been carrying. They knew now how Bobbie's plan had worked out. For all the others in between—the normal citizens of Auberon—the message was that the unstoppable Laconian machine could, in fact, be stopped. *Had been* stopped. The certainty that had come with imperial rule had a crack in it wide enough to drive a ship through. And like all good news, it brought a list of new problems with it. Good problems, the problems Bobbie and Naomi had been hoping for, but problems all the same.

"Five years of shipping records deleted," Chava said. "Wiped out."

"And it wasn't us?"

"It wasn't anyone I'm aware of," she said, pouring out a cup of coffee. "You know the network better than I do, but . . ."

"It just means that they'll load it from backups," Naomi said, taking the cup. She'd gotten used to Chava's French press coffee. It was strong and bitter and occasionally carried a bit of the coffee grounds in it. She found she was starting to prefer it to the normal ship-dispensed kind. "So it sounds like someone managed to get access to the backup. Put in whatever they want history to have been, and now it's the official record."

“That’s what I was thinking. Might be one of our cells acting independently. Or civilians taking initiative. Or criminals. Hell, it could be Laconians using the opportunity to hide something they did and blame it on us. No matter who it is, though, they weren’t confident enough to risk it before, and now they are. And what’s happening here? Some variety of it is going on everywhere else too.”

Decentralized authority was what Belters had done since the start, generations ago, when the power to communicate orders outdistanced the power to enforce them. Old Rokku, back in her radical days, had talked about the inners being like a sword that hit in one place hard enough to destroy. The Belt was like water, able to push in from all places at once. The death of the *Tempest* hadn’t actually changed anything for the systems outside of Sol. It wasn’t like Duarte had been willing to send his planet-killer warship to follow up on suspicious data loss. What had changed was the confidence people had in the system, and that uncertainty created new holes, cracks, and opportunities.

Laconia was powerful because it had a single vision, and one brilliant mind behind it all. The underground, like the OPA before it, probably had as many visions as there were people in it, and even as the titular leader, Naomi’s was only one of many voices. Duarte’s machine was limited. With enough going on at any given time, his attention could be flooded. That was his weakness and their power.

“New contacts are coming in too,” Naomi said. “I’ve had reports on almost a dozen since the first report came in.”

“That’s a good sign. People feel the tide turning.”

“Some of them do,” Naomi agreed. “And some of them have other agendas. I’ve spent months figuring out how to get our people hired on by their managers. They’re capable of doing the same thing to us.”

“I’ll be careful,” Chava said. “Background checks, surveillance on new recruits, test assignments. The whole show. I won’t let anybody sneak in the aft airlock.”

“You will, though,” Naomi said. “Test the people you trust too. Make it random. And make it so that someone can keep eyes on you. It’s like

checking the seals on your suit. Everyone checking everyone should just be normal. And be ready for the crackdown. Because it's coming."

Chava sipped her own coffee and nodded. "I wish you were staying. I mean, it will be nice to be able to invite my friends over to my place again, but . . . I've enjoyed having you here."

"Even though it risked getting you killed?"

Chava was one of those people who could frown with just her forehead. "Maybe because of that. I think I'm too much of an adrenaline junkie to survive as a ship rental manager. If it wasn't this, I'd be slingshotting on my vacations."

Naomi finished her coffee, put down the white porcelain cup for the last time, and hugged Chava goodbye. Naomi's belongings were in a tight-wrapped bag by the door. They fit easily under her arm. She looked around Chava's rooms one last time. The kitchen, the common area, the passage to the bedroom that had been hers for really not so long a time. Still, long enough for everything to change at least twice.

The knot she felt in her chest wasn't sorrow at leaving here. She liked Chava, and it was a pleasant space to be in, but it wasn't home. What she missed was the idea of a home of her own. People she knew for more than a few weeks at a time. It was worse, because she'd had a place once. And a family with it. She would never stop missing that.

The transport tubes on Auberon's lunar base ran cars every seven minutes, and the signs and directions were clear and well designed. It wasn't hard getting from Chava's place to the docks, or from the docks to the skiff taken out in a false name tied to an imaginary corporation and insured with a policy that would never be used.

Auberon was a target, and not only because it was a successful colony. Any Laconian traffic analysis of the bottles the underground used was going to show high throughput on the Auberon gate. With the *Tempest* dead, there would be a response, and neither she nor Chava nor any of her other high-level contacts doubted that part of that response would come to Auberon. And the best way to survive an asteroid strike was not to be on the planet.

While she waited for the traffic control queue to reach her, she opened a window and called up the visual telescropy on the planet below her. Another blue marble in the void. The wide whirl of a hurricane covered part of an ocean she'd never see. The scattering of continents across the visible hemisphere below her was like dice thrown in a backroom craps game. A vast, beautiful sphere with so few people on it. Cities with universities full of students who'd never known a different sky. She doubted she'd ever see it again, and so she watched and told herself to remember. There were so many last times that passed unrecognized. Knowing in the moment what was ending and wouldn't come again was precious.

The connection to traffic control went live. "Skiff eighteen forty-two, your transit to Bara Gaon is approved. You are clear to exit."

"Acknowledged, Control. Releasing the clamps now."

The little ship, light as an empty food can, shuddered when the docking clamps let go, and Naomi opened the throttle on the drive. The image of Auberon grew a little smaller, and a little smaller, and a little smaller until she closed it down. The moment was over.

The skiff was a tiny little thing, too small and undistinguished for a name. A transponder code, a number, and a perfunctory paper trail. It was as cramped as a racing ship, but without the maneuverability or high-end crash couch. It was intended for in-system trips, usually between planets in similar orbits. Taking it into the depths of the system, through the ring, and then back down some stellar gravity well meant traveling well outside its intended use. Naomi didn't find it intimidating. She'd gone much farther in much worse in her life. After a few days' hard burn, she went on the float.

She spent the hours double-checking the system, such as it was. Making sure the air mix was where it should be, the reactor bottle, the water tanks. Knowing everything about her little bubble of air and life was comforting. If she caught a micrometeorite, it would be too late to learn, so she did it now. Prepare for the worst and be pleasantly surprised. The skiff didn't

have a gym, but she still had her resistance bands from her life in the shell game. She could adapt. She always did.

She also found herself imagining conversations with Saba and with Jim and Bobbie and Alex. There were strategic decisions she was going to have to make. Bobbie's victory put Duarte on his back foot.

With only a single *Magnetar*-class ship left, there was a chance for the underground to drive Laconia into a purely defensive posture. Even restrict it to its own system. It would mean making a real and credible threat on Laconia itself, but it was possible. But it wasn't enough.

There had been a time when the Transport Union and the governments of Mars and Earth had expected Laconia to be like any other colony world: struggling for base survival and aiming for self-sustaining agriculture sometime in a generation or so. But Duarte had taken the protomolecule with him along with the expertise to use it, and he'd found the construction platforms that could build ships like the *Tempest* and the *Storm*. And apparently a way to create and bottle antimatter. A threat wasn't enough. She had to find a way to break that manufacturing capacity. If Laconia fell, it had to fall hard. It had to know that its dream was over, that it wasn't exceptional. Once it was broken down to the same level as other worlds, it could be brought back. Reintegrated. Because that was the trick. That was the deep lesson of the Belters and the inner planets. The OPA and the Transport Union.

It was the single central argument that the universe had made to her through her whole life, and she was only now seeing it clearly: Wars never ended because one side was defeated. They ended because the enemies were reconciled. Anything else was just a postponement of the next round of violence. That was her strategy now. The synthesis of her arguments with Bobbie. The answer she wished they'd found together, when they were both alive.

Once she reached Bara Gaon—the other major success among the colony worlds—she'd have to get a sense of what warships she could muster and the transit times. If there was a way to lure Duarte's forces out

away from Laconia system and then push in when their home fleet was spread thin, there might be a way.

She was still thinking about that, imagining what Saba or Bobbie or Jim might think, when she started the braking burn. The bottle from Sol system passed through the Auberon gate just a few hours after that. The skiff captured the encrypted data, just the way Chava's system would do back on the planet's moon. It took half a day to finish unpacking, so hours passed before she heard Alex's voice again and knew what they'd lost in order to win.

He looked . . . not older. He didn't look old. Or tired. She'd seen him look tired before. He looked diminished. Like the grief had taken some of the color from his eyes.

"So it turns out I'm done here," he said in his private message to her. "I got this young guy I been training up should be able to take over. We're headin' for . . . our little dry dock. You know the one." Even in three layers of encryption, Alex wouldn't say the word *Freehold*. "When we get there, I'm stepping out. I thought I might go check on the old girl. Make sure nothing's been makin' a nest in her. After that, I don't know. I guess that's your call, since you're running the show now. I don't want to take her out unless you're good with it. You and me are the only ones left now. So. Yeah. I'm sorry. I didn't mean to let Bobbie go."

"Don't apologize to me," Naomi said to the screen. Her tears made lenses over her eyes. "Oh, sweet man, don't apologize for this."

But the message was done, and the passage through the ring gate was almost upon her. She passed into the slow zone with a heaviness that didn't have anything to do with the rate of her change of velocity.

It was her first transit since they'd lost Medina. And Saba. And the model of human civilization that she'd understood. The station at the center of the ring was glowing bright as a little star, still shedding the energy it had absorbed from the gamma burst. The surface of the ring space, which had been a featureless blackness, danced with twisting auroras that were weirder and more threatening than the dark had been. What scared her more, though, were the ships.

She had expected the space to be empty. After everything that had happened, she'd thought traffic between the gates would be close to nothing. She'd been wrong. Her little skiff picked up transponder signals for almost two dozen ships, and drive signatures for more than that. The Laconian directive that the ring space be kept clear was being ignored on a scale she hadn't understood, and the raw danger of it took her breath away. With no Medina Station to control the passages, the chances of going dutchman were much worse than they should have been.

She'd made her transit in distraction and ignorance, and she could have vanished and never known why. And that was assuming that the event that killed Medina and the *Typhoon*, that had destroyed two of the gates in the network, hadn't changed the rules. If the threshold for vanishing was different now, they wouldn't know. Not without testing it.

Maybe it was the need for supplies on the vulnerable colonies or the chance to deliver goods without paying the union. Maybe it was that humanity, given freedom, forgot about the prospect of consequences. Whatever the drive, it took her breath away. It was such a shock that she didn't notice at first that two of the ships were Laconian warships like the *Gathering Storm*, or that they were burning toward her. In the mess of the traffic and her own internal chaos, she didn't see that until the skiff got the connection request from the *Monsoon*.

Her system had the software to disguise her voice and appearance, and she checked five different times that it was running before she accepted the request.

"This is Chief Petty Officer Norman of the *Monsoon*," the man on the screen said. "You are in violation of quarantine. Please leave the ring space immediately." His voice had the irritated singsong of someone reciting a hated ritual.

"I'm sorry," she said. "I didn't mean to. It's just that my brother's sick. I was supposed to be back to him weeks ago. I don't have any contraband, I swear."

"I don't care where you go," the Laconian said. "Just get out of here and stay out. There will a permanent force in here soon, and this kind of thing

will get people shot. Be somewhere else when that happens.”

“Yes, sir,” she said. “I’ll transit out right away, sir.”

The connection dropped. They were swamped. More than that, they had ships in the slow zone that weren’t stopping to control the space. That meant they either understood the risks and were keeping their exposure to a repeat of the catastrophe that had killed Medina Station and the *Typhoon* to a minimum or they had bigger fish to fry or both. And, she saw as she tracked their courses, the Laconian destroyers were heading for Auberon.

“You came close,” she said softly, “but no cigar.”

The Bara Gaon gate was on a secant that cut her passage through the ring gate to almost half what the maximum distance would have been. The gate wasn’t quite where the navigation system expected it to be. The loss of the Thanjavur and Tecoma gates had shifted all the others just the smallest bit, but enough to make the software care about it. She went to correct the course manually . . . and paused.

My brother’s sick, she thought. And so am I.

She corrected the skiff’s course, aiming it for Freehold. And for home.

Chapter Thirty-Six: Teresa

The day Teresa finally broke began like most days now. With a nightmare.

She had been awake until the small hours of the morning, watching old movies and entertainment feeds that she'd seen before. Trying to squeeze comfort out of them because they were familiar. Knowing what was going to happen before it happened made the stories feel very safe. Not at all like her real life. She stayed awake as long as her body would let her. And when she could stay awake not one moment longer, the dreams came for her all at once, like they'd been waiting for her. Like they were hungry.

There were three main varieties. In the first, she was in a strange part of the State Building, and her father—or sometimes her mother—was in a room nearby being killed, and she could stop it if she found the right doorway. In another, the planet Laconia had gotten a disease of some kind and bits of the land had started falling down deep into the burning core. Nothing was stable and nothing was safe. The third was formless and violent, less a dream than variations on Ilich's murder of Timothy.

Each version came regularly enough that she'd begun to recognize them. The dreams had even started commenting on it. As some new terror reared its head, she'd think *It's just like in my dreams, only now it's really happening*. It made the nightmares worse because it made them feel inevitable. Her waking hours were poisoned by them. The violence and fear and loss could spill out at any moment, from any place, and nothing could be relied upon.

It was terrible because it was true.

She woke after not enough sleep to the gentle tapping of a servant and Muskrat's excited bark. Breakfast was a favorite meal for the old dog. Maybe every meal was.

The servant brought in a white ceramic tray with a plate of eggs and sweet rice, a glass of watermelon juice, and a sausage with the dark, grainy mustard that she liked. Or that she had liked. Food wasn't something that interested her now. Not the way it used to. She stirred the sweet rice and watched the official newsfeeds talking breathlessly about the Laconian ships offering assistance to local governments in the ongoing fight against separatist violence. Images of men and women in Laconian formal blues talking seriously with the governors of Earth and Mars. She wondered if anyone believed that. She wondered whether she had.

She knew that if she didn't eat, her failure would be reported to Trejo. It had happened before. She took a bite of egg, but the rubbery texture of the white made her gag. The rice would be enough. It had to be. She hadn't been able to get more than half of her dinner down the night before. She knew that starving wasn't good for her, and that Ilich and Trejo wouldn't like it. That was part of why she did it. She took a spoonful of the rice, sucked away the thick, sweet sauce, and spat out the grains. On her screen, Admiral Gujarat was talking about the completion of the *Whirlwind*, the newest *Magnetar*-class ship, as if it weren't the only one. As if the first two weren't already dead.

She picked the sausage up. The smell of grease and salt was repulsive. She couldn't see it as anything but a slurry of dead animals in a thin membrane. She tossed it to Muskrat. Instead of wolfing it down, her dog looked from the scrap to her and back again and whined.

"You might as well," Teresa said. "I wasn't going to eat it before. I'm certainly not going to now."

Muskrat swung her wide tail twice, uncertainly. She ate the sausage with something that looked like shame. Teresa's numbness slid away for a moment, and tears came to her eyes. The State Building was filled with people from every system in the empire. She had people whose only duty was to cook her food, to educate her, to see that her clothes were cleaned

and put away. Nobody had the job of actually caring about her. The only one who even noticed her was a dog.

A voice spoke in the back of her head, as clear as if there had been someone in the room. It sounded like her own, but calmer. Drier. Somehow more adult than she thought of herself, like some later Teresa sending a stray observation back through time. *Muskrat likes Holden.*

The voice didn't go on. Teresa looked down at Muskrat's complicated brown eyes, and the sorrow lost its edge.

"You may have shitty taste in friends," she said. "Sorry, dog."

Another tap came at her door, and she didn't need to open it to know it was Ilich. She stirred her food to make it look like she'd eaten more than she had and let the door open. As soon as he saw her, his smile faltered.

"I know," she said, before he even spoke. "It's very important that we maintain the image that everything is normal. You tell me that every day." She stood up and put her arms out to the side. "This is normal. *I'm normal!*"

"Of course," he said with a practiced smile that meant he just wasn't going to fight her. "Your peer class is going to start soon. Dr. Okoye is going to be leading it today so that I can meet with Admiral Trejo."

So that I can do something more important, he meant. Even if he didn't say the words, Teresa heard them. Muskrat huffed and wagged her tail, anticipating the adventure of leaving her rooms. Teresa shrugged and walked toward the door, daring Ilich not to step aside. He stepped aside.

The State Building was the same as it had ever been. The archways, the colonnades, the gardens. Nothing about it had changed. It was her home and her kingdom. And somehow they'd made it into her cell, Ilich and all the others too. She was honored and revered and treated with total deference if she did what she was told, when she was told. Her opinion was listened to with seriousness and gravity, and then ignored. She stalked toward the lecture room, wondering what would happen if she marched in, took the microphone, and shouted *My father is brain-dead and nothing is all right*. It was enough to make her smile.

As it turned out, though, the fantasy wouldn't have worked. The lecture room had been rearranged for the day—six slate-topped tables stood in

rows of three. The other students—her so-called peers—were already there. Apparently Ilich had come because she'd run late and hadn't noticed.

The room stank of something deep and caustic. Air recyclers were set up in all the windows, scrubbing whatever the volatiles were out and blowing fresh air back in. Small trays sat on each table, two each, with a variety of scalpels, tweezers, pins, and thin scissors laid out between them. Elvi Okoye was walking among the students, leaning on her cane, and chatting as she went. Teresa felt her anger shift again. She was supposed to be fixing Teresa's father, not teaching classes to a bunch of kids. But, of course, Teresa wasn't allowed to say that. Because that wouldn't look *normal*.

"Good to see you, Teresa," Elvi said, and touched her hand. "I'm glad you're here."

Teresa shrugged and moved away, leaning against one of the tables. Now that she was close, she could see the bodies spread out in the trays and held down with pins. Dead animals. Dead as Timothy. Dead as her mother. Dead as all the people in the ring space.

"So today Colonel Ilich wanted me to, um, give you all a little introduction to parallel evolution. So what we have here are two different species from two different trees of life. One of them is native to Laconia, and the other one's from Earth. They're both called frogs because they fill the same ecological niche and because they have some similarities in anatomy. So, yeah. Get in groups of three, I guess? And I'll walk you through the dissections."

Teresa looked at the frogs. They both had pale bellies and darker skin, though the one she recognized was considerably darker. The rear legs folded differently, and one had two forelimbs to the other's four. From where she was standing, the thing they had most in common was that they were dead. She took a scalpel between her fingers, considering the blade, and wondered whether she'd be able to cut the bodies open without vomiting. The upside was she didn't have much in her belly to puke up. So that was fine.

“Hey,” Connor said. She hadn’t seen him come up, but here he was. Sandy hair and soft eyes. She remembered caring what his opinion was. She remembered wanting to kiss him like it was in a film she’d watched, and not something she’d felt herself.

She pinched the flat of the blade between her fingers and held the handle out to him. “Want to cut?” she asked. He took it and looked away, uncomfortable. That was fine. Shan Ellison made up the third of their group. When all the rest had formed up, Elvi Okoye opened a volumetric display with an image of two idealized frogs to match the ones on their trays.

“Okay,” Elvi said. “So one of the things that we see in both Laconia and Earth biomes is water. And there are animals that have found an advantage to living part of their lives in the water and part out. We call them amphibians. Both of your frogs are amphibians. And because water is chemically identical in both worlds, and the adult forms that we have here need to breathe air, there are some problems they both faced as they evolved. Some solutions look very similar, and some of their strategies could not have been more different. So let’s start with looking at the Earth frog’s lungs. Each team should make the first incision right here—”

Slowly, step by step, they began unmaking the frogs. Despite herself, Teresa found the process interesting. The way the Laconian frog cycled water in and out of its chest cavity to do the work that the Earth frog did with a diaphragm. The way the feeding mechanisms—mouth and esophagus for the Earth frog, chambered mouth and gut for the Laconian—served the same functions in different ways. She felt like it was all telling her something deeper than just biology. Something about herself and the people around her. Something about whether she could ever belong.

She realized she had been drifting off when Connor spoke to her again. His voice was quiet and tentative. “My mom.”

Teresa glanced up at Elvi. She was across the room, talking to one of the other groups.

“What about her,” Teresa asked.

“I was just saying that my mom, she’s . . . You know. She watches the newsfeeds. With everything that’s going on.”

He glanced at her, and then away like he was shy. Like he was saying something shameful. Shan Ellison didn’t speak, but watched with the intensity of someone expecting violence. It felt illicit and strange, like he’d said the first part of some password, and she didn’t know the rest.

Then, a heartbeat later, she did. He was asking her to tell him something reassuring. His parents were scared. He was scared. And because they were in peer class together, and she was her father’s daughter, he wanted her to tell him that everything was going to be all right. That she, knowing what she knew, wasn’t afraid and that he shouldn’t be either.

She licked her lips and waited to see what would come out of them.

“She shouldn’t spend too much time on them,” Teresa said. “I know everything looks really scary, but it’s not that big a problem. Dad has the best minds in the empire working for him, and they’re learning more every day. Everyone always knew there’d be setbacks.”

“Yeah,” Connor said. “Everyone knew.”

So she’d lied. That was interesting. She’d told him what he wanted to hear, and it wasn’t even because she wanted to protect him or keep him safe. It was just easier. She understood now why adults lied to children. It wasn’t love. It was exhaustion. And she was like them now. They’d eaten her.

“Are you okay?” Shan asked, and it seemed like her voice was closer than she was. Like the girl wasn’t talking from across the table, but whispering into Teresa’s ear. It sounded soft and weirdly intimate. *I’m fine*, Teresa said. Only the words didn’t come out.

She had the sense that she needed to leave now. That if she could get a drink of water and lie down for a minute, her breath wouldn’t seem so loud in her ears. She felt herself walking. At the door, someone’s arm appeared beside her, startling her. It was her own. She moved the hand, fascinated by her control of it married with the absolute emotional certainty that it wasn’t her arm.

Elvi Okoye was there too, like something from a dream. She said something, asked something, but before Teresa could answer, she'd forgotten what it was.

I wonder if I'm dying, Teresa thought, and the idea wasn't unpleasant.

For a while, Teresa lost herself. A flurry of sensory impressions—voices, movement. Someone was touching her hands and her neck. A bright light shone in her eyes. When she came back, she was lying down. The room was familiar, but until she heard voices she knew, she couldn't quite place it.

"I'm not drawing any conclusions," the doctor said. It wasn't Dr. Cortázar. It was her old pediatrician, Dr. Klein. And he was talking to Elvi Okoye. "What I'm saying is she's dehydrated and malnourished. Maybe she got that way because there's some kind of uptake problem. Maybe she's had an allergic reaction to something. Or her stress levels are so high, she's somaticizing. Or—and I'm just saying maybe here—she's been starving herself."

She was in the State Building's medical wing, on a gurney. There was a line connecting an autodoc to a vein at the back of her hand. When she shifted, she could feel the needle under her skin and the coolness in her arm where it was feeding fluid into her.

"I skipped breakfast," Teresa yelled, and her voice sounded normal again. "It's my fault. It was stupid. I just lost track of time."

They were at her side before she'd finished speaking. Dr. Klein was a youngish man with wavy brown hair and green eyes that reminded her of Trejo. She liked him because he'd given her sweets after her checkups when she was young and because he'd never condescended to her. Now he was looking at the system readout from the autodoc and trying not to meet her eyes. Elvi, leaning on her cane, was ashen. She looked directly into Teresa's eyes, and Teresa stared back.

"It was the frogs," Teresa lied. It came easily. "Between not eating first and cutting them up, I got light-headed."

“Maybe,” Klein said. “But if there is an underlying gastrointestinal issue, we should get on it quickly. There’s some microbial life on Laconia that we’re seeing fungal-model infections with. It’s not something to take lightly.”

“It’s not what’s going on. I promise,” Teresa said. And then, “Could I talk to Dr. Okoye for a minute?”

There was a moment’s hesitation that she couldn’t quite read, like Klein might refuse. But then . . .

“Of course.” He nodded to Elvi. “Major,” he said, and walked away.

When he was out of earshot, Teresa whispered, her voice harsh, “What are you doing bringing him into this? We’re not supposed to be around other people. Dr. Cortázar is my doctor.”

“He’s not a physician,” Elvi said. “His doctorate’s in nanoinformatics. He shouldn’t be practicing medicine any more than I should.”

“But he knows what’s going on. Do you want Dr. Klein asking around about why I’m under so much stress? You want him to figure it out?”

There was a joy to throwing all the things they’d said to her back at them. A delight in seeing Elvi flinch. She watched the woman struggle with something, and then reach a decision. Elvi sat on the end of the gurney, sighing as she took the weight off her leg. She rubbed her hand across her forehead.

“Listen,” she said. “I’m not supposed to tell you this, but you cannot trust Dr. Cortázar. I’m almost positive he intends to hurt you. Maybe kill you.” Then, a moment later, “Probably kill you.”

She felt a wave of vertigo, and the autodoc threw up a warning. It was just that she was hungry. That she needed water, that was all. Teresa shook her head. “Why?”

Elvi took a deep breath and spoke softly. “I think to give a well-known subject to the repair drones and see what they do. He has two others, but he didn’t have the kind of scans and prep work that he has with you. That and . . . he wants what you and your father were going to have. He wants to live forever too.”

Like the frogs, Teresa thought, and fought back cruel, despairing laughter. *He wants to treat me just like the frogs. Nature eats babies all the time.*

Holden had known too. He'd tried to tell her. That was two different people who'd warned her. Two different people who'd discovered the same thing. Elvi was holding her hand. The one that didn't have a needle in it.

"I've been trying to keep him away from you," Elvi said. "But Cortázar's very important. Without him . . . your father's recovery gets a lot harder. Everything gets a lot harder."

"We have to tell Trejo," Teresa said.

"He knows," Elvi said, her voice dark. "I told him. We're doing what we can. But you should know too. You should protect yourself."

"How?"

Elvi started to say something, stopped, started again. There were tears in her eyes, but her voice was steady. "I don't know. I'm in over my head here."

"Yeah," Teresa said. "Me too."

Chapter Thirty-Seven: Alex

You should rest,” Caspar said. “How many double shifts are you now?”
“I don’t know,” Alex said, leaning his back against the galley bulkhead. “But I can’t see that one more’s going to kill me.”

“Isn’t until it is,” Caspar said. “But that’s not even all of it. As hard as you’ve been working, you’re going to start making mistakes.”

Alex scowled at the boy. He knew Caspar hadn’t meant it as an insult. Knowing was what kept him from being angry. Or from showing it at least.

“When you catch me screwing up, I’ll stop taking doubles,” Alex said. “Until then . . .”

Caspar raised his hands in surrender, and Alex went back to his meal. Textured yeast paste and a bulb of water. It was his lunch if he was second shift, breakfast if he was third. So, in a sense, it was both.

The *Storm* had burned hard to get away from Laconian forces, but no one had chased it. No one dared to. To judge from the newsfeeds, most people weren’t sure what they’d done to kill the *Tempest*, and no one wanted to risk that they’d do it again. Which was just as well, because the more they pushed, the clearer it was how much the victory had compromised them.

Every shift found new, unexpected degradations in the *Storm*. Vacuum channels that weren’t transmitting power, regenerative plating that had stopped regenerating, atmosphere leaks so subtle that they couldn’t be located except as the slow and steady loss of pressure. Alex was no engineer, but he’d been on the *Storm* as long as any of them and in space since well before many of them had been born. When he wasn’t sleeping,

he was working to keep the ship together. He stopped when exhaustion promised a fast, deep, and dreamless sleep.

It wasn't the first time he'd used work to keep his emotions at bay. On and off his whole life, there had been times like this when the danger of feeling what he felt was too much to face. Some people got drunk or got in fights or hit the gym until they collapsed. He'd done all those things too, but with the *Storm* as beat up as it was, and the crew as injured and sick as many still were, this was fine. It kept him busy and it kept the ship alive.

Even so, it was imperfect. He knew he wasn't healed, and he suspected he wasn't even healing. The pain came in odd moments. When he was just waking up or going to sleep and his mind wandered. Then, sure. But also when he was crawling through the access spaces looking for a broken line or at the medical bay getting his daily ration of medication to keep the lining of his gut from sloughing off again. It would sneak up on him, and for a few seconds he'd be lost in his own mind, and the oceanic sorrow there.

It was about Bobbie, of course, but it spilled over. In his worst moments, he also found himself thinking about Kit's upcoming marriage. About Holden and that terrible last run they'd had together on Medina when he'd been captured. Talissa, his first wife, and Giselle, his second one. Amos, who was the worst loss in this because he'd just vanished into the enemy lines. Alex might never know what had happened to him. All the families he'd had, and all the ways he'd lost them. It felt like too much to bear, but he bore it. And after a few minutes the worst would pass, and he could get back to work.

The passage through the ring gates into Freehold system went as well as they could have hoped. Alex let Caspar do the heavy lifting. It was going to be his job soon enough, and it was better that he get the practice. They came in hot, bent their trajectory hard for the Freehold gate, and shot back out into normal space. In theory, it was possible to hit a gate from the realspace side at the perfect angle and make the transit through the intervening space in a straight line. In practice, there was usually a little flex, but Caspar did a good job. As good as Alex could have managed. They threw a fast torpedo

at the only thing that looked like a Laconian sensor array, blowing it to dust before they made their last course correction. It was as close to anonymity as they could ask without the shell game.

Freehold itself was a straightforward little system. The one habitable planet was a little smaller than Mars. Then a slightly larger one farther out with an unwelcoming atmosphere, and a series of three gas giants protecting the inner system. The *Storm's* home port was there, in the shadow of the giant they called Big Brother when they were being polite and Big Fucker when they weren't. It was a fraction larger than Jupiter back in Sol, with a blue-green swirling atmosphere and constant electrical storms that created arcs of lightning longer than the Earth was wide. Alex watched it grow close on the *Storm's* scopes, saw the black dot against it that was the rocky moon where they hid. Long-dead volcanism had left lava tubes big enough to land the *Storm* and a small fleet like her under the lunar surface, and that's where they were headed. Toward the permanent base of Belter engineers and underground operatives that Bobbie had called the "pit crew."

The knock at his cabin door was polite. Even tentative. Caspar stayed in the corridor, braced with a handhold.

"Hey," the boy said. "You coming?"

"Where to?" Alex asked.

"Bridge. You got to take us in, yeah? Tradition. A pilot retires, he takes himself to the last port."

"What kind of tradition is that?" Alex said with a chuckle. "I've never heard of it before."

"Made it up," Caspar said. "Just now. Can't turn that down, start your own tradition."

"You can take us in," Alex said. "You need the practice anyway."

"No," Caspar said. "It's you or we just plow the fucking thing into the moon and call it done."

"You're a shit liar," Alex said, but unbuckled himself from his crash couch all the same. "You should work on that."

"Just like everything else," Caspar said. And then, "You're really going."

“Yeah,” Alex said. “I really am.”

“You were good.”

“You will be. You don’t need me here.”

He drifted out of his cabin, the light g of the braking burn making “down” a strong suggestion more than a real weight. He headed for the central lift and up to the bridge. As he floated into it for the last time, the rest of the crew braced their feet to stand at attention. Caspar, behind him, began to clap, and the others joined in. By the time Alex reached the pilot’s station, his eyes were damp enough to obscure his display.

“On your order, Captain,” he said.

“Bring us in, Mr. Kamal,” Jillian said.

The actual landing was easy, from a technical perspective. Even as injured as it was, the *Storm* knew where the walls around it were, and where the encrustation of human structures would be. Alex felt a great weight falling away from his heart. The custom docking clamps they’d made back when the *Storm* was a recently captured prize of the war slid home with something between a sound too low to hear and a shudder.

“Welcome back, reisijad,” the Belter-inflected voice said over the comms. “Looks like you fucked your ship pretty good?”

“It’ll give you lazy fuckers something to do,” Jillian said, the way Bobbie would have. Same inflection and all. It seemed right in a way Alex couldn’t quite describe that the girl had paid so much attention to how Bobbie ran things. Even when they were gone, the next generation up would keep echoes of them.

The shuttle to Freehold was a single-hulled transport called the *Drybeck*. It had begun its life as an ore hauler and been retrofitted sometime in the last twenty years. The company that had owned it had a color scheme of green and yellow, and the ghost of its logo still haunted the bulkheads on the bridge. Its drive was small and touchy, prone to stutter when the burn changed, and limited by a tiny reaction mass tank. The hold was lined with crash couches, and the half dozen of the crew most compromised by the death of the *Tempest* were coming home more as cargo than companions.

The long fall down from the gas giants passed through the area that would have been the most trafficked space in Sol system. Hundreds of ships would have moved between Saturn and Jupiter and the inner planets. Maybe half a dozen did the same in Freehold. Alex plotted the course with a growing sense of the emptiness of the system that mere decades couldn't fill. It was too big. All of it was too big. He'd been there from the beginning, been part of blazing humanity's trail to the stars, and he still couldn't quite get his mind around how vast the spaces were.

He was surprised when, a few minutes before departure, Jillian came to the little bridge and sat in the couch beside his without buckling in.

"You coming down with us?" Alex asked.

Jillian looked at him for a long moment without speaking. She looked older than he thought of her as being, as if taking command, even for so short a time as this, had aged her.

"No," she said. "The family wants to see me, and I'd like to see them too. But there'll be time for that when the war's over."

I admire your optimism, Alex almost said, but the darkness was too much. He didn't want to bring her down with his own skepticism. Instead, he nodded and made a noncommittal sound in the back of his throat.

"There's a fast crawler waiting for you in port," she said. "It's got enough water, fuel, and starter yeast to get you going."

"That's good of you. I appreciate it."

"It's not altruism. Your ship," she said. "It's old, but it's a gunship. Still better than most of what the underground has burning out there."

"Maybe," Alex said. "It could also be a nest for whatever birds live in the desert down there. That's part of what I'm going to find out."

"When you do, you reach out. The only people who fly solo are slingshotters and assholes. You got to have someone with your back."

The comms clicked up. The shuttle was clear to leave. All Alex had to do was respond. He put the message on hold.

"What are you saying?" he asked.

"We're not done," Jillian said. "Not just that, we're winning. Underground is going to need every ship it can get, and yours would be a

good one to have on the team. If you need a crew for her, you tell me. I'll get you one."

Alex didn't know what to say. The truth was, he didn't have a plan except to get back to the *Rocinante*. But she was right. There was going to be an after. An after Bobbie. An after Amos. An after Holden. Whatever he was doing, he wasn't going out there to die. Just to recover.

"I'll let you know what it looks like," he said. "We'll make a plan."

Jillian stood and held out her hand. He shook it without unstrapping.

"It's been good," Jillian said. "We've done good work."

"We have, haven't we?" Alex said.

After she left, he went through one last systems check. Flying single-hulled ships was a kind of gambling he usually avoided, but even if he hit a micrometeorite, they'd probably survive it. Anyway. Life was risk.

He flipped the comms back on.

"This is *Drybeck*," he said. "I am confirming clearance to launch."

"You're still clear, *Drybeck*," the voice on the other end of the connection said. "Not blowing nothing up, and no one floating out there to run into. Ge con Gott, yeah? Draper Station out."

Draper Station, Alex thought as he eased the ship through the lava tube on its maneuvering thrusters. It was the first time he'd heard it called that. He didn't hate the sound.

Freehold, like most goldilocks-zone planets, had a wide variety of environments. Freehold's salt deserts were on the same continent as the lush mountains he'd hidden in when they first came and the township that had grown to be a modest city. White dunes and mesas of red stone stretched from horizon to horizon. Tent rocks rose in some places, and knife-thick ridges that could have been artifacts of alien civilizations or just beautiful geology. The dawns were warm pink, and the sunsets were green and gold. Alex didn't know why. At night, the desert sang. High fluting tones as the temperature shift made the sand itself ring like a wineglass.

The fast crawler was mostly autonomous, and it took its navigation from the time and the position of the sun like an ancient sea captain on Earth. There was no signal coming in or going out that would give Alex's position away. The transport's wide titanium-and-rubber treads made the trackless badlands easier to cover than the simplest flight in a ship. The solitude was vast and consoling. He'd expected to feel lonely on the trip, but he wasn't. The effort of being okay around the crew of the *Storm* had, it turned out, been exhausting. He hadn't even known he was making the effort until he didn't have to anymore. He slept in the little bunk in the crawler's belly and spent his days sitting on top of the machine watching the sun and sky and stars and didn't even listen to the music he'd brought with him.

Twice, huge shambling animals with legs like slender trees and coats like yellow moss had walked with him for a while. The second had been with him almost half a day before it cooed three times and turned away. As far as he knew, he was the only human being who'd ever seen them.

He'd wondered more than once why Naomi had chosen to live in a hidden shipping container, but now, here, he thought he understood. The pleasure of being utterly alone made his mourning into something different and strange and humane.

The cave where they'd put the *Roci* was in the western quarter of the desert. He'd picked it because it was near a patchwork of radioactive ore that added a little camouflage if the enemy was looking for it and acted as a landmark for him.

The fears that haunted him now were that the *Roci* wouldn't be waiting for him. That the shelf he'd parked her under had collapsed in his absence. Or that the sealants they'd put on to protect the hull plating had broken down or been compromised by desert animals, exposing a ship built for vacuum to the erosion of wind and sand and salt. As the hours fell away, his anxiety started to grow. The peace of the desert rolled past until the crawler reached the edge of its automatic course and came to a shuddering halt beside a vast outcropping of stone.

Alex took a flask of water and a cloth to tie across his mouth and dropped to the salt-rich sand. The shade under the stone was cool. He followed the tracks of glass where the *Roci*'s thrusters had melted the sand, it felt like lifetimes before.

And there, dark and quiet and perfectly intact at the back of the cavern, was the old Martian corvette. Something had scratched at the sealant—maybe animals, maybe the sandblasting desert wind—but nothing had broken through. It was just his imagination that made him feel like the ship was welcoming him. He knew that. It didn't matter.

It took the better part of a day to cut through the sealing coat and get the airlock answering him, but after that, things moved faster. They'd drained the water out of the tanks before they left, but the crawler's supplies were enough to get the ship almost halfway to capacity. Getting the recycling system back online was harder. He spent half a day checking feed lines before he found the one that had split. And it took another half a day to replace it. It would have taken Naomi or Amos or Clarissa half an hour.

He didn't sleep in the crawler anymore, especially once the *Roci*'s galley was able to turn out a little food. With his limited supplies, the food was spartan and the drinks were water and green tea. The ship was lying belly-down on the ground, everything was at ninety degrees from where his mind wanted it to be, and he had to climb to get to his cabin and his crash couch.

Lost as he was in the work of hauling his old ship back to herself, he could almost pretend he was waiting for his old crew. That they'd be there in the machine shop and the flight deck, laughing and arguing and rolling their eyes like they had before. A week into the effort, he'd exhausted himself and fallen onto his couch without eating dinner. He found himself slipping between dreams and wakefulness, hearing their voices in the hallway. Clarissa's dry whisper and Holden's earnest concern like they were really there, and if he just concentrated, he'd be able to make out the words. The alert tone as the airlock opened and familiar footsteps in the halls.

When the silhouette bent into his doorway, he still thought he was dreaming. It was the sound of a living voice, the first since he'd left

Freehold, that brought him back to himself.

“Hey,” Naomi said.

Chapter Thirty-Eight: Naomi

Hey,” Naomi said.

Alex shifted in his crash couch, and the hiss of the gimbals was like something made from memory. He blinked at her, confused and sleep drunk.

“No shit?” he said.

“No shit,” Naomi said.

“No, no, no. I just . . . I didn’t know you were coming.” They were simple words. Commonplace. They carried a heavy weight.

Time and tragedy had thinned Alex’s face and darkened the skin under his eyes. His smile was joyful, but it was a bruised kind of joy. The pleasure and delight that could only come to someone who understood how precious they were, and how fragile. She figured that she looked the same.

“I got your message about heading back here, and . . . well, I had some other plans, but the more I thought about it, the more sense coming back to the *Roci* made.”

“Thought about it a lot, eh?”

“Ten, maybe fifteen whole seconds,” she said.

Alex barked out a laugh and hauled himself up. She stepped into the cabin, and they embraced. The last time they’d touched had been on the deep transfer station back in Sol. There had been three of them.

After a moment, they stepped back. She was surprised by how good it felt to see Alex in the familiar environment of the *Rocinante*, even if the ship was ninety degrees from her usual orientation.

“How’d you get here?” he asked, still grinning.

“I have a crackerbox with an Epstein,” Naomi said. “From Auberon to here. It’s not rated for atmosphere, though, so I parked it at the transfer station and hitched a lift down on a shuttle.”

“Planetside again.”

“And my knees already hate it. But I’m in a ship, so it’s not too strange,” she said. “You’re never going to convince me that this whole ‘sky’ thing isn’t fucking creepy. I like my air held in by something I can see, thank you very much.”

“You want a drink? The old girl’s not all the way up to snuff, but she can make you some tea. Maybe even some maté by now, depending on how the recyclers are doing.”

“I wouldn’t say no,” Naomi said, and then, because it felt stranger to leave it unsaid than to say it, “I am so sorry about Bobbie. I cried for a whole day.”

Alex looked down and away. His smile shifted invisibly into a mask of itself. “I still do sometimes. It’ll take me by surprise and it’s like it’s happening again, for the first time,” he said.

“Thinking about Jim does that to me.”

“You should have seen her, XO,” Alex said, and he did something between a laugh and a sob. “Like a fuckin’ Valkyrie, you know? Flying at that big-ass ship like she could take it down by herself.”

“She did. Take it down by herself, I mean.”

Alex nodded. “So did you have a plan now that you’re here?”

He couldn’t talk about it anymore. She understood that. She let the subject drop.

“I was following you,” she said, turning to climb up the deck to the main lift—a corridor for the moment. “Now that Medina and the *Typhoon* are gone, we could actually move between gates again.”

“That does open up some possibilities,” Alex said. “My to-do list has two things on it. First one’s put the old girl shipshape again, and the second’s figure out what to do next.”

“That sounds perfect,” Naomi said. They reached the galley. The tables projected from one wall, but there were built-in jump seats for times like

this. She pulled two of them out. “Let’s do that.”

It turned out that Alex’s first entry gave her days of work to do. He’d gotten a decent start on the re-up process, but the *Rocinante* had been dry for a long time. Probably the longest since she’d been made by a Martian Navy that didn’t exist anymore. A lot of the systems were old, and the newer ones were replacements that didn’t ever fit together quite the way the originals had. There had been a little corrosion in the reactor shielding. Nothing that time and use didn’t justify, but something to keep an eye on. She felt herself falling into a rhythm she hadn’t known existed, and recognized perfectly. Normalcy. This was how life just was, and everything else she’d done, however comfortable she’d been with it, had been the aberration.

Day after day, she and Alex went through the ship, troubleshooting each system as it came back up. A full crew could have done the whole thing in ten hours, and there were only two of them. But they got it done—the reactor up, the comms, the power grid, the thrusters, the weapons. Some maintenance routines assumed there would be teams of four, but they found workarounds. One piece at a time, the *Rocinante* came back to life.

As they worked, she saw some of the ways Alex’s time on the *Storm* had changed him. Whether he knew it or not, he understood electrical systems better than he had before. And he’d learned some tricks about checking the stability of carbon-silicate lace plating that shaved half a day off her estimates.

At night, they slept in their old cabins. She didn’t know whether Alex went through his cabinets, but she went through hers. She’d never had much that she claimed as her own, but what little there was felt like the artifacts of some other, ancient Naomi. It was like coming across a favorite toy from childhood and being reminded of all the half-forgotten experiences that traveled with it. The shirts she’d worn that Jim had liked. The mag boots with the extra strap at the calf that helped stabilize her knee. A broken

hand terminal she'd meant to fix before she went into hiding and hadn't ever gotten around to.

There were other cabins in the ship, with other personal supplies. Things that had belonged to Amos and Bobbie. Maybe even Clarissa. Maybe Jim. The trivial leftovers of a life. She was tempted to go through those too, but she held back. She wasn't sure yet that she'd be doing it for the right reasons, and it turned out that mattered to her.

As soon as the comms were up, the *Roci* started gathering covert communications from the underground. Three bottles had passed through Freehold gate since she'd left her shuttle. One from Sol, one from Asylum, one from Pátria. More would be coming. When she wasn't working, she paged through the information and listened to the reports of the leaders of the underground. Of her underground.

It was a week and a half after her arrival, and Naomi was out, sitting on the desert sand as the sun set. The truth was that as much as she enjoyed complaining about being planetside, there was a kind of surreal thrill to being under a vast dome of air. After an hour or so, she had to go back inside or she started getting anxious. But for that first thirty minutes, it was beautiful. The sunlight seemed to sink into the sand, lighting it from within. And the star field that bloomed above her head was familiar, even if the high air made the steady stars seem to flicker and shimmer.

It felt very strange to be in such a quiet, peaceful, empty place and also the middle of a war.

She heard his footsteps on the sand, soft and regular as an air intake gently cycling. She sat up and dusted the sand from the backs of her arms. Alex was wearing his flight suit, and it hung a little loose on him. Even with his usual beaming smile, he seemed a little deflated. He grunted as he sat on the dune beside her.

"You holding together okay?" Alex asked.

"I'm all right," Naomi said.

"Just asking because you've been spending a lot of time working the *Roci* with me, and then going straight to the reports and newsfeeds when you're done. You haven't taken much downtime."

Naomi felt an old, familiar touch of annoyance, and it was strangely delightful. If Alex had started his mother hen habits back up, it had to mean he was feeling better. Not recovered, maybe never that, but improved.

“Doing the briefings is my downtime.”

“Coordinating a massive resistance to an authoritarian and galaxy-spanning empire is your hobby?”

“I didn’t have an option. We don’t have a golgo table, and . . . No offense? Even if we did, you play like a Martian.”

He chuckled to show he knew it was affection. “Have you got a note back for them? Another bottle to pop out into the systems?”

It was a hard question. Even when she’d had her mind on the panels and wiring of the *Rocinante*, a part of her had been thinking about the grand strategy of the underground. About limiting Laconian reach and power, about taking advantage of the openings left by the enemy’s mistakes.

And about the goal at the end. That was the trick of grand strategy. Knowing where the journey was ending even when you were making up all the individual steps to get there.

Working on the *Roci* had given the insight she’d had on the passage out from Auberon time to season. What had been a vision of a possible future had, while she worked with her hands and taken her mind elsewhere, become a bone-deep certainty. As long as Laconia had the capacity to make ships like the *Tempest* and the *Typhoon*, it could never grow past being an oppressor. The dream of empire could only die if the ancient Martian dream of independence through better technology was put to rest.

An attack on Laconia posed half a dozen unsolvable problems, and Naomi thought she had solutions to at least four of them . . .

“I’ve got some things I should send out. I can bounce a broadcast off the repeaters at Freehold and up to the *Storm*. Even if there aren’t any ships closer to the gate than that, they can get one of their torpedoes going. And if they’ve been doing what they’re supposed to, they’ll have some bottles already on the float near the gates.”

“Lightspeed is way better than the best drive,” Alex said, nodding sagely. “Trying to send a bottle from here would take a pretty long time.

You know, though, there is a way to shave a few seconds off the time it takes to get your messages out.”

She shifted to look at him. The sun was gone, and the rose-and-gray twilight made him look younger. She lifted an eyebrow, inviting him to go on. He looked at her with feigned innocence.

“All we’ve got to do is be a few light-seconds closer, right?”

It hit her with a relief she hadn’t expected. She looked up into the Freehold sky, past it to the stars.

“Right,” she said. “Let’s do that. I’m sick of walking on walls.”

An hour later, they were strapped into their couches on the flight deck. Working the *Rocinante*’s displays was like singing with an old friend as she checked the maneuvering thrusters’ output profiles. The reactor was stable. The thrust was good. Even after its long rest, the *Roci*’s power grid was solid.

“We’re good,” Naomi said. “Take her out.”

“Oh yeah.”

The ship lurched, and the crash couches shifted. Naomi had the familiar sense of motion as they accelerated and then slid out of the cave on maneuvering thrusters only. The deck swung around and down until it was under her, and she sank into the gel as Alex took them higher from the ground.

When the drive kicked in, the whole ship rocked and shuddered, and Naomi felt the prick of the needle and then the coolness of the juice in her veins, keeping her from suffering the worst of the g forces. Alex was grinning like a kid on his birthday as the old gunship rose again for the great emptiness. Naomi watched the external temperature as they rose, the atmosphere growing colder and colder, but also thinner and thinner until there wasn’t enough there to conduct away heat at all. The shuddering stopped, and the only sounds were the ticking of the air recyclers and the occasional harmonic chiming of the drive passing through a resonance frequency. On her tactical display, the planet fell away behind them and they passed escape velocity. They weren’t even in a long orbit of Freehold now. They were on their own. Free.

Naomi shouted, a wide, celebratory yawp. And Alex answered back. She lay back in the couch and let herself just be home. Just for a moment.

The *Roci* was an old ship now. She'd never be state of the art again. But like old tools, well used and well cared for, she'd become something more than plating and wires, conduits and storage and sensor arrays. Old Rokku had said that after fifty years flying, a ship had a soul. It had seemed like a cute superstition when she was young. It seemed obvious now.

"God, I missed this," Alex said.

"I know, right?"

An hour later, Alex put them on the float, and Naomi unstrapped. Freehold system was so empty, there was no traffic control authority. No flight plans or patrols watching for drive plumes without transponders. She started her diagnostics running, but she already knew from the sound of the drive and the taste of the air that they'd come back clean. She moved from station to station, checking the displays and controls as if there were other crew members who might be using them.

She didn't notice the change in Alex's mood until he spoke.

"I tried to keep her alive. I really did. Right at the end, she was out there throwing rounds at that great big bastard, and I was going to take us in. Burn the *Storm* right in there and try to get her back on board. But there wasn't time." His sigh had a shudder in it. "And it would just have fucked things up if I'd done it."

Naomi wrapped her hand around a foothold and braced. She turned to look at him, and this time he met her eyes.

"She was a hell of a woman," Naomi said. "We were lucky to know her."

"The thing I kept thinking all the way out was, *How am I going to tell Kit his Aunt Bobbie's gone?*"

"How did you?"

"I haven't yet. I couldn't stand to when we were in Sol system. And now . . . I still don't know if I can. I miss her. I miss all of them, but . . . but I watched her go, and . . . Shit."

“I know,” Naomi said. “I was thinking about her a lot. I sent the okay for the mission.”

“Oh, Naomi. No. This isn’t your fault.”

“I know that. I don’t always feel it, but I know it. And it’s strange, but the way I comfort myself? I think of all the other ways she could have died. Like oncocidal-resistant cancer. A reactor bottle failure. Just getting old and frail until the antiaging drugs weren’t enough anymore.”

“That’s a little macabre,” Alex said. Then, a moment later, “But yeah. I know exactly what you mean.”

“It was Bobbie,” Naomi said. “She knew we don’t live forever. And if she’d gotten to choose a way to go, I bet this would have been in her top five.”

Alex was quiet for a few seconds, then sniffed. “I miss her every minute of every day, but god damn, it was just so fuckin’ *right*.”

“Going hand to hand with a ship the combined strength of Earth, Mars, and the Transport Union couldn’t beat and winning?”

“Yeah. If we’ve got to die, I guess that’s a pretty good way to go. Still. I’m sorry we’ve got to die.”

“Mortality does suck that way,” Naomi said.

“What would be your way?”

“I don’t know. That’s not what I think about,” she said, surprised that she knew her opinion about what aspect of her own death was important to her. “I don’t care how I go. There are just things I want done first.”

“Like what?”

“I want to see Jim again. And Amos. I want this war over with, and a real peace established. The kind where people can be angry with each other and hate each other and no one has to die over it. That’d be enough.”

“Yeah,” Alex said. “That would. I think about Amos a lot. Do you think —”

There was something like a great, soundless pop—a detonation without quite being a detonation—and Naomi fell. Would have fallen if direction still existed. Everything had gone the electric noncolor of eyes pressed too hard in the darkness. Nothingness buzzed around her like an assault.

Somewhere nearby, someone was screaming. It might have been Alex. It might have been her own voice.

The bright void she fell into—falling in all directions at once—had shapes inside the light, jagged and shifting as a migraine halo. She felt something missing in herself, but couldn't tell what it was. That frightened her worse than the suddenness and strangeness of the transition. The sense of absence without an object, of loss without knowing what had been lost. She tried to close her eyes, but nothing changed. She tried to reach out, but there was nothing to reach for. Or with. She couldn't tell whether she'd just fallen into the light or if she'd been falling for hours.

She felt herself slipping into something else. Something like sleep but not sleep, and she resisted by instinct. A deep fear wrapped itself around her, and she held on to it as if it could save her.

And then, without any more warning than had come before, it was over. She was on the *Rocinante's* flight deck. She'd drifted away from her crash couch. Behind her, Alex gagged. She grabbed a handhold and braced. Her body felt wrung out, exhausted. Like she'd been awake for too many days, and the fatigue had seeped into her muscles.

"Did we," she said, and her voice sounded weird in her ears. She swallowed and tried again. "Did we lose time?"

The soft tap of Alex's fingers against a control panel. She closed her eyes, grateful beyond words that the darkness came when her lids fell. A wave of nausea came over her and left again.

"We did," Alex said. "Lost . . . almost twenty minutes."

She pushed off, navigating her way to her couch by long instinct more than thought. She strapped in with a sense of deep gratitude. Alex's face was grayish, like he'd just seen something horrifying.

"That wasn't . . . that wasn't like the other ones," he said. "That was different."

"It was," Naomi said.

Alex checked over the *Rocinante's* status and seemed to take some comfort in it. Naomi was tingling, the pins-and-needles feel of a pinched

nerve, but without a physical location on her body. Like her mind was slowly coming back. It was a deeply unsettling feeling.

“Fucking Duarte,” she said. “Fucking Laconia and their fucking tests.”

“What do you think they did this time?”

OceanofPDF.com

Chapter Thirty-Nine: Elvi

Elvi's hand terminal chimed again. It was past time for her to go, but she couldn't pull herself away. Also, the girl in the glass cage didn't have a chair, and so Elvi had chosen to sit on the floor beside her. The prospect of getting back up with her aching leg wasn't pleasant.

"So," she said, "it wasn't a change in cognition?"

There was a moment of eerie stillness, the off-putting pause that they always seemed to have, and then Cara shook her head. "I mean, it's hard to be sure what it was like really, but I didn't have the feeling of being any different. Except for the library, you know."

The library was what Cara and Alexander—whose nickname in the family had been Xan—called the information that they carried with them after their re-creation by the repair drones. It was, according to them, like knowing things without having to learn them first. Sometimes the information was straightforward, like details about the local environment. Sometimes it was inscrutable, like the fact that substrate-level entities were difficult to refract through rich-light. That was the most interesting example, because Cara understood what the substrate was, and what refraction meant in that context, and the nature of rich-light, but the whole body of knowledge didn't connect to anything. There was no shared context with anything like food or trees or water. Any human knowledge. It was, Elvi thought, like finding a sea turtle who thoroughly understood Godel's incompleteness theorem, but didn't have any sea-turtley application for it.

That kind of cognitive artifact was a large part of why Cortázar had drawn the conclusion that Cara and Xan weren't actually the children they'd been before they were "repaired," but alien technology created using

human corpses. It was a deep question, and one that Elvi struggled with. The children had clearly been transformed. The fact that they weren't aging or developing was evidence enough of that. The blackness of their eyes and the grayness of their skin dropped them straight into an uncanny valley that still made something in Elvi's hindbrain recoil.

But then sometimes when no one was observing them, Xan would put his head in Cara's lap so she could ruffle his hair. It was a moment that primates had been sharing back to the Pleistocene, deeper and more recognizable than mere humanity. Or Cara would crack a joke about something Elvi asked, and then smile almost shyly when Elvi actually laughed. Elvi's opinion shifted on them. Sometimes she was sure they were puppets of inscrutable alien technologies. Sometimes it seemed obvious that Cortázar had built his case that they weren't human just so he could keep them in a cage for a few decades and run tests on them. Elvi wasn't sure if she liked them or if they scared the shit out of her. If they were passing their Turing test, or if she was failing it.

But it was interesting that none of Cortázar's work on Duarte seemed to have resulted in the high consul's getting access to the library, and the weird turning-off of consciousness hadn't broken Cara and Xan the way it had Duarte. There was a clue in there somewhere. She had the dataset. She just needed the right grid to put over it, and the pattern would make sense. She could feel it.

Her hand terminal went off again. This time with a message. Her transport had arrived. She was late for the briefing. She muttered something obscene and started levering herself up to standing. "I have to go."

"We'll be here when you get back," Cara said, and after a pause, Xan laughed. Elvi smiled too. It was silly to treat them like she'd been having lunch with friends and had to go too soon, but there she was. Sometimes she was silly.

She leaned on her cane as she made her way out through the labs to the fresh and open air. Her leg hurt. The regrowth, as simple as it was, was going slowly. Poorly. Faye's new foot was already in place, the skin a little paler and softer, the new muscles still prone to cramp if he walked too

much. But he'd regrown bones and tendons and nerves, and she was still leaning on a cane.

The difference, she knew, was the stress. Fayez was almost ornamental in her present life. He slept in, ate at the State Building, visited with whoever came through the gardens or read books or watched old entertainment feeds. He recuperated. Elvi was diving through Cortázar's data when she wasn't examining Duarte's condition or trying to keep Teresa from being murdered in the name of curiosity or going over her own data from the *Falcon*. She was barely sleeping, and when she did, it was just rolling the dice to see what flavor of nightmare was taking its turn.

There would be a point when it was all too much. When the intrusive image of Sagale with a part of his head missing wouldn't let itself be kicked down the road for her to think about later even one more time. When she'd break. It hadn't come yet, though, so she didn't have to deal with it. She was very aware that she was working on what Fayez called fuck-it-if-it's-not-happening-right-now protocol.

Worse than that, she was coming to a place where she enjoyed the intensity. She had never been under more stress in her life, except maybe once, back on Ilus. Everyone had been going blind, and there were neurotoxin-covered slugs crawling up out of the ground, and alien artifacts coming to life, and people murdering each other over political issues and personal pride. Everything had depended on her talent and the sharpness of her mind. And now it did again. And part of her loved it like it was sugar. Probably not a healthy part.

The driver waiting for her had an umbrella up to shield her from a light, misty rain. He didn't speak. When she got to the car, she leaned toward him. "Let Trejo know I'm on my way."

"I already have, Doctor," the driver said.

Drivers, Elvi thought as they pulled away, were a strange kind of affectation. It would have been easier to have a transport just pick her up and take her without another human involved. Having someone there whose job was to be deferential to her actually slowed things down. An extra layer of processing. Like that pause the children had. She wondered if it was like

a stutter. She had to read up on that. Maybe there was something useful in it.

The State Building was wreathed in mist. The car's heater wasn't quite enough to push back the cold that radiated from the window. Early winter on Laconia—on this part of Laconia anyway—seemed to involve a lot of chilly days and bitter nights. As soon as the sun went down, all the mist would turn into an all-encompassing layer of ice. The local trees had all retracted their leaves. The imported ones had seen all their chloroplasts die out and were in the process of dropping red and yellow and brown remnants.

Inside, the climate was warm and dry, as controlled as a ship's, but the light from the windows was muted and gray. It still smelled like rain. A different servant took her jacket and asked if she wanted a snack or a cup of tea delivered to the briefing room. She said yes out of habit. Her attention was already divided between the past—sitting with the children or alien child-corpse puppet things—and the future—her report and analysis of the most recent mass blackout event. There was literally no room in her awareness for the present.

The briefing room was beautiful. Walls of polished rosewood with a subtle gold inlay, and lights set behind frosted glass that left the place shadowless. Trejo and Cortázar and Ilich were already there, seated around a malachite-topped table. Trejo looked as bad as she felt, and Ilich maybe even a little worse. Cortázar was the only one of them who was bearing up well under the stress. She was pretty certain that was because he didn't care whether any of the rest of them lived or died.

"Sorry I'm late," she said. "I'm sure you understand."

"We've all been busy," Trejo said, and either it was a subtle dig or it wasn't. She couldn't tell which. "Regardless, we're all here now. And we have to make a statement about this . . . latest event. What can the high consul say about it? What do we know? Colonel Ilich? Would you like to begin?"

Ilich cleared his throat. "Well, we experienced another event that appears to have simultaneously affected everyone in the system. And by

simultaneous, again, I mean that it appears to have been a single, nonlocal event that happened . . . everywhere. We have reports that it also occurred in at least two other systems.”

Cortázar raised his hand like a kid in grade school, and Trejo nodded at him.

“What happened in the ring space?” Cortázar asked. “Was it the same as in the systems?”

“We don’t know,” Ilich said. “We didn’t have any of our ships in the ring space at the time. There’s some indication that ships in the ring space may have been . . . um . . . eaten, if that’s the term. The same way the *Typhoon* and *Medina* were. But I don’t have confirmation. The event doesn’t seem correlated with anything we did, but we only have an active naval presence in about one hundred and twenty systems right now. If something happened outside of those, we might not know.”

“Seriously?” Trejo said.

“I can’t overstate how devastating it’s been to lose *Medina* Station, sir. Controlling that choke point was the leash we had on the empire. Without it . . .”

Trejo leaned back in his chair, scowling. He opened his hands to Elvi and Cortázar, giving the floor to them. Cortázar didn’t seem to care, but Elvi found herself sitting forward to speak as if she owed the admiral something.

“If I can try to put this all in a wider context?”

“Please do,” Trejo said.

“It’s about the nature of consciousness.”

“That may be a wider context than I was looking for, Major.”

“Bear with me,” Elvi said. “Unless we’re reaching for religious explanations, which I’m not the person to comment on, consciousness is a property of matter. That’s trivial. We’re made out of matter, we’re conscious. Minds are a thing that brains do. And there’s an energetic component. We know that neurons firing is a sign that a particular kind of conscious experience is happening. So, for instance, if I’m looking at your brain while you imagine something, I can guess reliably whether you’re

imagining a song or a picture by seeing if your visual or auditory cortex is lighting up.”

“All right,” Trejo said.

“There’s no reason to believe that a brain is the only structure capable of having that combination of structure and energy. And in fact, there’s a fair amount of evidence that the gate builders had a conscious structure—a brain-like thing—where the material component wasn’t at all the same kind of thing we use. Anecdotally, we’ve found at least one brain-like structure that was a diamond the size of Jupiter.”

“I don’t know what that means,” Trejo said.

“Like we don’t have a steel chamber in fusion reactors. We have magnetic bottles. Magnetic fields that perform the same basic function as matter. The older civilization appears to have developed its consciousness in a form that relied more on energetic fields and maybe structures in unobservable matter than the stuff we made a brain from. There’s also some implication that quantum effects have something to do with our being aware. If that’s true for us, it was probably true for them.

“My thesis—the one I was working on before I came here—explored the idea that our brains are kind of a field combat version of consciousness. Not too complex. Not a lot of bells and whistles, but takes a lot of punishment and keeps functioning. Our brain may actually have a kick-starting effect, so when the quantum interactions that underlie having experiences break down, they’re easier to start up again. Does that make sense?”

Trejo said *Barely* at the same time Cortázar said *Of course*. The two men looked at each other. Elvi felt annoyed at both of them, but she went on.

“So, the scenario that James Holden brought back from the alien station in the ring space was of something systematically destroying the consciousness of the older civilization. Killing it. The previous civilization tried getting rid of systems. Inducing supernovas. That didn’t help. They eventually closed all the gates, and that didn’t fix the problem either, because whatever it was killed them all anyway.

“And that’s where we came in. We found—and I have directly observed—things that we call bullets or scars or persistent nonlocal field effects. Basically a place where whatever hates the ring gates has done something to collapse consciousness on a planet or in a system. Or in all the systems at once. What I suspect—and I don’t have any data for this—is that the enemy figured out how to snuff out all the systems at once, whether the gates were active or not. I believe that our travel through the gates is irritating to these beings. Maybe even damaging in some way. When that damage gets high enough, they react.”

“So when I killed Pallas Station in Sol . . . ,” Trejo said.

“You also hit some weird, aphysical dark god in whatever passes for its nose,” Elvi said. “And they did what you’d expect them to do. If you get sick and a penicillin shot makes you better, then the next time you get sick, you try another shot. Only it turns out we aren’t the same kind of conscious system as the gate makers. We don’t break as easy, and we recover better. What slaughtered their civilization just lost us a few minutes of time.”

“How disappointing for the dark gods,” Trejo said.

“Right? But then they’re not done. Especially, and no offense here, when we start dropping bomb ships into wherever they are. Playing tit for tat. And the way this one *felt* different? Light and shapes instead of that kind of hyperawareness?”

“I did notice that, yes,” Trejo said dryly.

“I believe that the enemy, whatever it is, is experimenting with new ways to break conscious systems. Brains. I think we’re the equivalent of a penicillin-resistant infection, and the last event we experienced was an attempt at tetracycline.”

“And the trigger?” Trejo asked.

“There doesn’t need to be a trigger,” Elvi said, “if the enemy has gone past being purely reactive. Maybe we just convinced them to take us seriously.”

Trejo sank a little as the implications unfolded in his mind.

“Is this new information?” Cortázar said. “I feel we’ve covered this all before. I mean, nothing in this is really new, is it?”

Trejo and Ilich exchanged a look.

“It’s useful to me,” Trejo said, “to have Dr. Okoye’s summary. So yes. Do we have any progress on healing the high consul?”

“It would be helpful,” Cortázar said, “if I could examine Ilich’s castoff. I don’t suppose there’s been any new word on finding it?”

Trejo’s effort to hold his temper was visible. “Before we move on to that, if we could address the health of the high consul?”

“He’s stable,” Cortázar said. “Very stable. Perfectly fine.”

“Improving?”

“No.”

Ilich broke in, his voice tense. “Is there no way we can get him back?”

Elvi wasn’t going to let Cortázar bullshit this one anymore. Either he had a plan he’d been holding back for his own reasons or he didn’t. She leaned forward and put her hands on the desk, palms down, like she was revealing a hand at a poker table. “I don’t see any realistic path toward returning him to his previous state.”

Trejo nodded to her and shifted to Cortázar. “Do you disagree?”

Cortázar squirmed. “His previous state? Probably not. But moving him forward into a new state is much more plausible. Easy, even. And more than that, instructive.”

Trejo went terribly still. A soft tapping came at the door, and the servant came in with Elvi’s snack. She’d forgotten all about it. When the door was closed again and privacy restored, Trejo hadn’t moved. His eyes weren’t focused on anything in the room, and his skin was pale. It took Elvi a moment to understand what she was seeing.

All this time, Trejo had hoped. He’d believed that his leader would return, that the righteous king would rise and retake his throne. Despite everything Elvi had said, the admiral had believed Cortázar could Merlin his Arthur back from madness. She was watching Trejo realize he had just been letting someone play with the corpse. She was someplace between horrified for him and relieved that he’d finally heard what she’d been saying all along.

“All right,” Trejo said. And then again, more slowly, “All right. The high consul is going to have to make a statement all the same. We’ll draft something.”

“We can say that the event was a test,” Ilich said. “The high consul’s elite team has made a breakthrough. A new weapon against the enemy.”

“Or we could tell them the truth,” Elvi said.

Trejo stood, his hands clasped behind his back. The anger and irrationality in his expression were grief. Grief made people crazy. When he spoke, his voice buzzed with barely controlled rage. Not at Cortázar either. At her.

“I don’t think you understand exactly how precarious our situation is here, Dr. Okoye. I have a two-front war with no fronts. This is not a moment to undermine and degrade the confidence of our troops or embolden separatist terror. You have just outlined war on a cosmic scale. I can’t prosecute a battle against your dark gods while guerrillas degrade our forces. We have to unify humanity for this. We have to strike with one will. We can’t afford to fuck around knocking each other’s comm relays down anymore. That is going to get us all killed. Do you hear what I am saying?”

“I do,” Elvi said, and she was surprised by the steel in her own voice. Trejo heard it too. “I’m hearing you say you can’t handle this. You want the fight with the underground over with? Easy to do. Surrender.”

“Your jokes aren’t funny,” he said.

“They aren’t when they’re not jokes.”

Chapter Forty: Teresa

Every night she went to sleep, Teresa thought that maybe the next day would be the one that brought her father back. Like with the story of Pandora's box, all the other fears and nightmares were made bearable by that one hope. Every morning that she woke, there was that sense of possibility that stayed bright as long as she could keep herself from checking in. And then Kelly, her father's personal valet, would tell her that nothing had changed because of course it hadn't. She'd feel let down again, and still, idiotically, stupidly, like a cartoon character with an empty grin, the thought would come up. Maybe tomorrow. Always maybe tomorrow.

His rooms weren't grand. They never had been. A bed frame of natural wood and a thin mattress that he would rest on, even after he'd outgrown sleep. A desk with metal, locking drawers and a screen built into its surface. The only decorations in the place were a picture of her as a child, one of her mother from when she'd been alive, and a simple glass vase big enough for a single flower that Kelly replaced every day. Winston Duarte, high consul and architect of the Laconian Empire, had taken pride in having a simple man's quarters. The greatness of Laconia wasn't in its gaudiness, but in its works. The vastness of the empire's ambition would have made any man seem small. Even him. That was how she thought of it, anyway. What she'd believed.

Now he sat at his desk, his head shifting as if he were trying to follow the flight of insects that only he could see. His hands rose sometimes and then drifted back down like he'd started to reach for something and then forgotten what he meant to do. Kelly had brought her a wicker chair to put beside him. Teresa sat on it, her hands clasped on her knees, watching him for any sign of improvement. Any hope that today might be the tomorrow she kept herself alive for.

“Daddy?” she said, and he seemed to react to the sound. He turned a degree toward her, and even though his eyes didn’t meet hers, something like a smile touched his lips. Kelly kept her father’s hair well combed, but it seemed thinner than she remembered it. Grayer. Greasier. The ancient acne scars on her father’s cheeks made him seem rougher, more worn than he actually was. There was an amazement in his expression, like he was constantly discovering wonders that commanded his attention more than she did.

“Daddy,” she said again, “he’s going to kill me. Dr. Cortázar? He’s going to *kill* me.”

He turned toward her more, his brow taking on a gentle furrow. Maybe he’d heard her, maybe it was coincidence. He reached out his hands to pat at the air around her head the way he did sometimes, only this time she took his fingers in hers, pulling his hands down, pulling his face toward hers. “Are you there? Do you understand what I’m telling you? He wants to kill me. He wants to pin me down and cut me up like those frogs. And no one’s helping. No one even cares.”

She was weeping now, and she hated that she was.

“Come back,” she whispered. “Daddy, come back to me.”

He opened his mouth as if to speak, but only made wet clicking noises. Like meat being moved by a butcher. He frowned for a moment, then looked away toward the window.

“Daddy,” she said again. And then, “*Daddy!*”

He flinched at the sound.

The door opened behind her, and she heard Kelly’s gentle cough. She dropped her father’s hands and wiped her tears away. Not that she could hide the fact that she’d been crying. The best she could do was show that she’d stopped.

“Is there anything I can get you, miss?” Kelly asked. He wore his usual red porter’s uniform. She’d known him forever, since she was a child gamboling down the halls with the puppy who would grow into her Muskrat. He’d brought her tea and served her meals. She’d cared about him the way she cared about doors and pieces of art. As a thing. A function. An object. Now they were in the room together, and she saw him as a person. An older man, as

devoted to her father as anyone could be. As complicit in hiding what he'd become as she was.

"Does he change?" she asked. "Does he ever change?"

Kelly lifted his brows, looking for what to say. His sigh was soft and apologetic. "It's hard to say, miss. There are times he seems to know where he is. Who I am. But that may be wishful thinking on my part."

Her father had drifted back to following his invisible bugs through the air. His forehead smoothed. If he'd heard her at all, understood her at all, he'd been distracted from it. She shifted her weight, and the wicker chair creaked under her.

"I'll come back," she said. "If he changes. If he gets better . . ."

"I will see that they tell you immediately," Kelly said.

She rose, feeling disconnected from the motion. Like she was watching a Teresa-shaped balloon with its string cut. Kelly stepped over to take the chair away as she walked to the door.

"He would be glad to know you came," Kelly said. "I can't say if he knows we're here. But if he did know, he'd be glad. I believe that."

He meant the words as comfort, but Teresa couldn't bring herself to care. She walked out without thanking him or cursing him or doing anything but putting one foot in front of the other until she was out of the private rooms.

The public parts of the State Building where the mechanisms of government went on were as busy and efficient as ever. Like a beehive or a termite hill that was unaware that its queen was dead. No one stopped her or made eye contact. She passed through on the way to her own rooms like a ghost. All she wanted was to lock her doors and crawl into bed and pray for a dreamless sleep that would carry her to tomorrow. Or later. Or at least not now.

But when she got there, her door was open. Colonel Ilich was sitting on her couch. He didn't look up as she came in.

"Where's Muskrat?" Teresa asked.

"She's in the bedroom. You missed your tutorial this morning," he said, his voice pleasant and nonjudgmental and false as a mask.

Teresa folded her arms. "I was with my father."

"I respect that, but your father would want you to perform your duties. All your duties. That includes your education." Ilich stood, pulling himself to his

full height like it might lend him more authority. “And your breakfast.”

“I wasn’t hungry.”

“That isn’t the issue. We are in—”

“Dangerous times,” Teresa said. “A precarious situation. We have to keep up appearances. I know. Everyone keeps *telling* me.”

“Then stop acting like a spoiled little shit and do your part,” Ilich said.

It was fascinating to see his expression when the words were out. She was so used to him being in control, professional, approachable, friendly. The shock widening on his face, and the purse-lipped chagrin. And then the pleasure. Pride, even. It didn’t take more than a few seconds, but it told its own little story.

“You,” he said before she found the words to throw back at him, “are the high consul’s daughter. You are the face of your family. That makes you the stability of the empire.”

“The empire’s fucking wheels are coming off,” Teresa shouted. “Everything’s falling apart. What do you want me to do about it?”

His voice was tight and controlled. “I want you to eat your meals. I want you to show up for your lessons. I want you to project normalcy and stability and calm to everyone who sees you. Because that is your duty to your father and the empire.”

The rage felt like it was lifting her body. She didn’t know what she was going to say. She didn’t have an argument or a stance, only the power that came from being incensed beyond her capacity to contain it.

“But you can spend days running around looking for Timothy? You can have Dr. Okoye come teach because nothing she does is as important as making sure you can finish killing my friends? You aren’t doing your work either, so you don’t get to tell me to do mine. That’s hypocrisy!”

Ilich looked at her, looked deep into her eyes, and he chuckled. He reached out and ruffled her hair like she was Muskrat and he was scratching her ears. It was gentle and humiliating. Teresa felt her rage stutter and die, and a vast embarrassment flood into the place it had been. She wanted the anger back.

“You poor kid. Is *that* what this is about? The spy? You’re mad at me because of him?”

“I’m mad because of everything,” she said, but there wasn’t any power behind it now.

“He wasn’t your friend. He was a spy and an assassin. He was here to kill us. That cave of his? He picked it as shelter for when he set the pocket nuke off. The mountain was a landmark for his evacuation team.”

“That isn’t true.”

He took her arm just above the shoulder. His grip was tight enough to pinch. “You missed your tutorial this morning. We’ll make it up now. You need to learn something.”

The security offices of the State Building were familiar to her. They were offices like any other branch’s, except for the occasional reinforced door and blast-resistant lock. There were cells there for political prisoners, though she didn’t know if anyone was in them besides James Holden. The forensics lab, however, was new. It was a wide room with a high ceiling and movable partitions that could seal off a section and keep its atmosphere separate. Fume hoods with waldoes and blast-resistant glass lined one wall. The tables that filled the center of the room had aisles between them wide enough for specialized tool carts—chemical, biological, electronic, computational—to be wheeled to wherever they were needed. Half a dozen people stood at the workstations. And on them, Timothy’s things. The carved wood tools. The cot. The cases and boxes that had been his. Even one of the repair drones that had apparently been damaged somewhere in the violence lay on a table, the size and rough profile of a dead animal.

Ilich cleared the room so they would be alone. The technicians left, trying not to be obvious in the ways they stared at Teresa. She saw the curiosity in their faces. What was the high consul’s daughter doing there? What did it mean? The weight of their interest was like a hand on her shoulders, pressing down.

When they were alone, Ilich put her on a technician’s stool and brought a data storage core over. She recognized it from Timothy’s cave, though she hadn’t thought about it much at the time. Ilich synced a monitor, pulled up a file directory, and stepped back, gesturing to it as if to say, *Go ahead. Look.*

Teresa found she didn’t want to.

“Start with the notes files,” Ilich said. “Let’s see how much Timothy was your friend.”

The notes were dates and times. At first, she didn’t see any pattern in them, but the notations with the entries had a security note from the forensic tech. When she opened it, Timothy’s entries matched the security logs for those dates. He’d been watching the State Building’s guards. Working out their patterns and habits. Looking for a hole. And he’d been tracking James Holden. Those records were more scattered, because Holden had less of a pattern. He’d drifted through the buildings and gardens as he saw fit, and Timothy—Amos, his name was Amos—had marked every time Holden came in sight of his watching post on the mountain.

Once she’d gotten through the notes file, she didn’t stop. She opened a tactical maps file and recognized the architecture of the city, of the State Building. A series of files showed blast radii of a small nuclear device. If it were planted at the wall. If it were set off in the city. If it had been smuggled into the State Building. Each one had notes speculating on deaths, on infrastructure degraded. She opened a file called “evacuation protocol.” Topographical maps showed a primary evac site close to where she’d met him the first time and a secondary a day’s hike away, with notes Timothy—Amos—had added about what parts of the visible defense grid would have to be taken out for each site to be practical.

Here is how he would have killed us. Here is how he would have left. Here is the man he came to save, here are the people he came to destroy. She waited for the rage to come back. She expected it. Instead, she thought of James Holden. *If he said he was your friend, then he was.*

“Do you see now?” Ilich said. “Do you see what he was?”

All these plans to kill her and her father. To slaughter them all. *You should lie down on the floor there. Flat as you can. Put your hands over your ears, okay?* Were those the words you said to someone you wanted to kill?

“I understand,” she lied. “I do.”

Ilich shut off the monitor. “Then we’re done here.”

He took her arm again and led her away. She hadn’t seen him order up food, but when they got back to her rooms, it was waiting for her. A thick, white protein slurry like they fed to sick people. A steak of vat-grown meat

seared black at the surface and warm pink in the center. Eggs. Cheese and fruit. Sweet rice with flakes of dried fish. It was all on a metal tray with a fork and dull knife. Muskrat trotted in, but caught the sense that something was wrong. When Ilich held his hand out, offering to scratch her ears, she ignored him and went to sit on Teresa's feet instead.

"Now then," Ilich said. "Eat your meal. Get some rest tonight. Tomorrow, you will be on time for your lesson. We will be in the east garden where everyone on staff can see us, and you will act as if everything were normal. Do you understand?"

"I don't want to eat this. I'm not hungry."

"I don't care. You're going to eat now."

She looked at the food in front of her. Reluctantly, she picked up the fork. She remembered something from an old film she'd seen about a girl in Sol system. On Earth. "I don't have to do this. Body autonomy is written into the constitution."

"Not ours it isn't," Ilich said. "You will eat this now, while I sit here and watch you. Then we will sit for another hour while you digest it. Or else I will call in Dr. Cortázar with a funnel and tube, and we force you. Am I understood?"

Teresa took a forkful of the steak and put it in her mouth. Intellectually, she knew it tasted good. When she swallowed, Ilich nodded.

"Again," he said.

After he left, Teresa didn't move. She just sat on her couch, feeling the weight in her stomach. She hadn't eaten a meal that large in weeks, and it left her feeling bloated and wrong. Muskrat sensed that something was off, and put her wide, furry head on Teresa's lap, looking up at her with complex brown eyes.

Teresa put on a feed. The same one she'd watched as a child. The nameless Martian girl and the fairy named Pinsleep. Familiar images washed over her, bringing something close to comfort. A sense of predictability, at least. She knew that at the end, the nameless girl would escape fairyland. That she'd go back to Innis Deep and her family. That in the last scene, she'd pack away all her girlhood toys and leave for upper university and an adult life. That was the

sign that she'd won. She was free to make any life she wanted, and not be a prisoner of the elves.

She lay down on the couch, resting her head on a pillow. The girl was taken in by Pinsleep again, and ran, and fought to escape. And escaped. Teresa started it again from the beginning.

Prisoners and their dilemmas. She let the images play and took up her handheld. In her notes, she found Ilich's old diagram.

	TERESA COOPERATES	JASON COOPERATES
JASON DEFECTS	T3, J3	T4, J0
TERESA DEFECTS	T0, J4	T2, J2

She ran her fingers over it. She'd forgotten that Ilich's first name was Jason. She'd forgotten a lot of things.

The puzzle—the unsolvable part—was that no matter what she did, it was better for the others to defect. If she was good, they should take advantage of her. If she was bad, they still should. And the same logic applied to her, except she hadn't done it. Everyone else had defected, and when she didn't cooperate, they forced her to. Even though the thing that made sense was to defect.

Pinsleep discovered that the girl wasn't in her cell and screamed. Thin fairy fingers balled in stylized fists. Muskrat snored deeply, her fuzzy body pressed close to Teresa. She put her own hand down and scratched the old dog. Black with gray in her muzzle and at the tips of her ears. The thing she hadn't wanted to know pressed at her throat, welling up like a bubble rising from the bottom of the ocean. She felt like she could watch it come, and she knew that when it reached the surface, nothing about her life would be the same. Everything would have to change, because she'd changed.

And it happened, not with a scream, but with an exhalation. She leaned down, her lips almost against Muskrat's floppy ear. When she spoke, she

whispered.

“This isn’t my home anymore. I can’t stay here. I have to leave.”

Muskrat looked up and licked Teresa’s cheek, agreeing.

OceanofPDF.com

Chapter Forty-One: Naomi

The Freehold gate, like all the gates, was stationary with respect to its local sun. That it didn't fall into its distant star was just one of its many mysteries, but since they couldn't hook a chain between it and the *Roci* and hang from it, they did not benefit from its gravity-defying properties. Instead, Alex parked the *Roci* close to it with the Epstein drive on a gentle burn to balance the pull of the sun.

The flight out to the ring gate had been eerie. The *Rocinante* had been her home longer than anyplace else. She'd slept more of her nights in these crash couches, and eaten more of her meals in the galley. She had breathed the air that passed through the ducts and filters more times than she could calculate. Being inside the ship now, she felt the presence of the others. Her memories of them. What surprised her most was that it didn't hurt.

She'd left the *Roci* not long after Amos took his covert assignment to Laconia. Alex was going to join Bobbie on the *Storm*. Naomi, they had all thought, would hire on a temporary crew for the *Rocinante* and keep her flying. Only she hadn't. At the time, she'd barely been able to explain why. She could still remember some of the rationalizations she'd used—*A gunship is harder to hide than one person* and *The Rocinante has symbolic value as a prize that ups the risk of using her* and *The underground on Freehold will be able to use her if the need for defense arises*.

They'd all been true, and none of them had. Looking back now, she saw that she'd left because staying would have been worse. She hadn't let herself feel the loss of Jim too deeply. Or of Amos. Or Clarissa. Bobbie had invited her to join the crew of the *Storm*, but Naomi hadn't accepted, and Bobbie hadn't pressed the issue.

Now, strapped into the spiderlike framework of a salvage mech and burning for the ring with her two transmitters and the spool of wire, she looked back at the ship—her ship—and it still ached. But it was bearable. She had taken her grief and locked herself away with it because she'd been skinless. It had been the best way she could find at the time to keep every new day from feeling like a little more salt on the wound. But that had been a different version of her. She'd grieved, but more than that, she'd changed. The woman she was now wasn't quite the one she'd been on the day that Jim left. Or even on the day she'd chosen not to accept Duarte's invitation. Between the loss of Saba and Bobbie's defeat of the *Tempest*, Naomi had been reborn so quietly she'd hardly even noticed. The only real evidence was that she could be on the *Rocinante* again. She could come home.

"You're almost there," Alex said. "How's it look?"

"Big," Naomi said.

The gate was only a thousand kilometers across. This close to the surface, it might as well have been half of the universe. This far from the sun, the mech's HUD needed to add some false color augmentation so that she could see more clearly what she was dealing with. She made her braking burn. She only had a little time before her orbit slid past her, but the transmitters were already wired together. She tapped through the initialization codes, and the compressed nitrogen thrusters took it from there. The primary transmitter shot out through the ring, and the secondary took up a stationary position relative to the ring gate except for a slow drift that would eventually snuggle it up against the physical surface of the ring itself. As repeaters went, it was about the simplest version there was—one step up from cans and string. But it didn't have to last long.

"How's it looking?"

"I'm watching," Alex said. "I've got sync from the local side. I'm waiting for a response from . . . Yeah, okay. We're looking good. Come on back."

"Copy that. I'm heading in," Naomi said. "So much for the easy part."

"Taking what I can get."

Naomi turned back toward the *Rocinante* and started her burn. The mech had enough power in the thrusters that she could have worked out there for a few hours without any risk, but she was just as happy not to. The cooling on the unit wasn't what it had been, or else she was less tolerant of being overheated.

By the time she'd gotten back to the ship, cycled through the airlock, packed the mech safely away, and floated up to the flight deck, the transmitter had been working for a little under three hours. The first cycle was passive, looking for signals coming from any ships in the ring space and identifying as many as they could. It looked like there were about a dozen at the moment, but all of them were recognizable as Transport Union or smugglers. Nothing had the comm signal or drive signature of a *Storm*-class destroyer, and nothing was the *Whirlwind*. No ships at all would have been better, but this was as good as Naomi could have reasonably hoped.

The connection request signal was the first real risk she was taking. If there were Laconian sensors in the ring space, this was going to give away what gates had active cells of the underground behind them. If things went the way she hoped, that information wouldn't matter much. It was a calculated risk.

For almost a minute, there was no reply. The farthest gate was only a little under a million clicks. The light delay should have been nearly trivial. Naomi had a sinking feeling—What if they were the only ones? What if the plan had already fallen apart?—and then the connections started coming through. First just one, then a handful, then a small flood. Fifty-three answers in all. Fifty-three systems with their full supply of ready warships, out of retirement and at her command. Easily hundreds of ships.

"Not bad," Alex said from his couch.

"It's excellent until you do the math," Naomi said. "Then it's ninety-six percent no reply." But she smiled when she said it.

Her plan, long since sent out via bottle and echoed from system to system, was larger than Laconia. Larger than the fifty-three systems that had sent ships for the fight. Even as she'd been setting out her makeshift repeater, an alert was going off at the transfer station on Nyingchi Xin. A

pirate was breaking into Laconian warehouses on the largest moon of the smallest gas giant in Sanctuary system. A massive data breach was being reported from the new shipyards in Yasamal system. Hopefully dozens of other small actions and issues, anyplace that a *Storm*-class destroyer was in the system. After the death of the *Tempest*, Laconian forces and the factions that had thrown their lot in with them had to be nervous. That was her handle on them. It let her and her people distract them and draw them thin. They had to look strong now in every corner of the empire, because they already looked weak.

The next phase lost the anonymity and safety of the bottles. With a sensation like walking off her ship under an unfamiliar sky, Naomi chose the first of the connection requests and opened it. There was a hiss of static and the compression of sound that the multiple layers of encryption left behind.

“Nagata here,” Naomi said.

“Zomorodi back to you,” Emma’s familiar voice replied a few seconds later. “We’ve got the *Cama*, a half dozen rock hoppers with rail guns mounted on ’em, and ten antipirate gunships recently liberated from the governing council’s shipyard at Newbaker.”

“Ammunition?”

The lag was present, but not so bad that she had to trade recorded messages. The immediacy felt almost intimate.

“Oh, damn. Knew I forgot something,” Emma said, and Naomi heard the teasing in her voice. “Of course we’re loaded up. The *Cama*’s got a full hold too. Anyone needs resupply, we’ll be there. Unless they kill us all. Then, not so much.”

“Fair enough. Send me the specs and transponder codes. And what happened to Captain Burnham?”

“Early retirement,” Emma said. “Cashed out and bought part of a medical clinic.”

“Probably smarter than all of us put together.”

“I’m leaning toward coward.”

“Good to hear from you, Emma. Keep drives ready. I’ll be sending a flight plan as soon as I have everyone.”

“Standing by until then, Admiral.”

Naomi dropped the connection and took the next. Eight ships with old-style stealth composites and internal heat sinks. They’d have been the kings of space a couple generations back, but they weren’t bad even now. The next group had a *Donnager*-class battleship they were pulling out of mothballs. A quarter million tons of pieces smuggled to an empty moon and welded back together like a child’s model kit with a one-to-one scale. If she was lucky, there would be three or four more like it. Building them had been a pet project of Saba’s.

Saba, who’d started it and hadn’t lived to see it through. These people she talked with, whose lives she was now in a position to risk at best, spend outright at worst, were Saba’s network. They were the sword he’d dropped on the battlefield that she had picked up.

Fifty-three systems. Four hundred and eighteen ships with five Transport Union supply ships and three *Donnager*-class battleships among them, and the *Storm*—still compromised, but able to fly, still on her way. The best hammer that the underground could put together.

And it still wasn’t half the size of the force the *Tempest* had killed in Sol. Hopefully, if she’d done this right, it would be enough. If she’d been fooling herself, they’d all pay the price. But she was pretty sure she was right.

Once she had all the specs, she started sorting through by drive model, ship mass, and total energetic profile. Alex showed up with a tube of spiced lentils and a bulb of cold tea. She didn’t know she was hungry until she started eating it, and then she was ravenous. She put the monitor aside, rolling the tube and pressing to get out every bit of the spicy, rich mush. When it was gone apart from a burning aftertaste and a pleasant pressure in her gut, she sighed.

“Just like old times,” Alex said. “You never could remember to eat when you had a good problem to solve.”

“My old problems were never like this. It was more how to make sure we get to the next port safely.”

“That’s not what we’re doin’?” Alex asked with a grin.

“Nothing about this has any relationship to safety. This is exactly what I never wanted to be doing. Fighting? Getting people killed? I never even carried a gun.”

“I knew that,” Alex said, and the grin had turned into something softer. “There’s still time. Call this off, head back to port. Go back to getting our people elected into the Association of Worlds.”

Naomi was silent, her mind and her heart at odds the way they so often were. Alex misunderstood.

“I’m only half joking,” he said. “There is time to pull back. We haven’t committed these folks to anything. Not yet.”

“No, we have to do this. If there was time . . . I don’t know. Maybe. Maybe I’d have kept looking until I found a better way. One that wasn’t this.”

The comm controls alerted, a little orange strobe blinking with the incoming message. But it was only the *Storm*, updating her ETA. Naomi tucked the empty food tube into her pocket. She’d throw it in the recycler when she was done here. The bulb of tea cooled her fingers and pulled a tiny sheen of condensation out of the air.

“You feel like you owe it to them?” Alex asked, gently. “To Bobbie. And Saba. Amos.”

“No,” Naomi said. “And not to Jim either. This isn’t guilt. It’s . . . possibility? I don’t want to fight. I don’t want anyone to get hurt. Or die. Not our side, and not them either. I want to reconcile. That’s why Bobbie always got so frustrated with me. She wanted to win.”

“Looks like you do too, now.”

“The problem is it’s hard to reconcile when you’ve lost,” Naomi said. “Someone takes all the power, and you try to bring them into the fold again? That’s capitulation. I don’t think violence solves anything, not even this. Not even now. But maybe winning puts us in a place that we can be gracious.”

“Meet Duarte halfway?” Alex said. She could hear in his voice that he wasn’t convinced. If she couldn’t sway him, maybe there wasn’t hope. But she tried.

“Make space for him. Maybe he’ll take it, maybe he won’t. Maybe his admirals will see something in it he doesn’t. The point of this fight isn’t to kill Laconia. It’s to get enough power that we can close the distance they opened between them and everyone else. That may mean punishing some people. It may mean answering for old crimes. But it *has* to mean finding some way forward.”

“You sure that’s not owing something to Holden?” Alex said. “Because that sounds an awful lot like something he’d say. And then everyone else would roll their eyes at.”

“I don’t know,” she said. “Maybe. There needs to be a Saba now, so I’ll be that if I have to. But there’s going to need to be a James Holden later. And if he’s not there to do it, we’ll have to pick that up too.”

“What about a Naomi Nagata?”

“She should probably finish solving her traffic control problems. I don’t want anyone going dutchman. Or setting off another lost-time incident. Not if we can avoid it,” Naomi said. The comm alerted again, and this time she answered it. “*Rocinante* here.”

“This is the destroyer *Gathering Storm*,” a woman said. Her voice almost hummed with pride and the prospect of violence. “Requesting permission to dock and transfer crew.”

Alex raised a hand. “I’ll take care of this one, Admiral.”

Naomi transferred control to Alex. “Hey there, Jillian. This is Alex. You are good for docking, but make sure Caspar knows to slide in from the side. It may not look like we’ve got the drive on, but we do. I don’t want to prove it by cooking you.”

“Like your little drive could burn us,” the woman said.

“I’d feel bad about it, is all. I’ll send the codes.”

“It’ll be good to see you, old man,” the *Storm* said, and dropped the connection.

“Jillian Houston,” Alex said. “She’s a good kid. She’ll make a fine captain.”

“I remember her father being an asshole.”

“She’s also kind of an asshole.”

It was three hours before the *Storm* sidled up beside the *Rocinante* and extended its docking tube. It was strange seeing the Laconian ship with its alien technology, but also with the same design history as the *Rocinante* itself. Naomi sometimes forgot that Laconia was in so many ways the heir to Mars until something like this reminded her.

She was still putting the final touches on her transit orders when the new crew came over, and Alex had to prod her more than once to get her down to the airlock. He was right, of course, but the project was complicated and so close to finished, it was hard to step away from it.

The *Rocinante* had run for years on a skeleton crew of four, and then expanded up to six. It was designed for twenty-two. The people who came in, drifting in the microgravity, were a mixed bunch. Belters and Freeholders and a gunner from Brazil Nova who’d joined up on Ganymede. She greeted each of them as they came aboard, hoping that she could commit each name to memory and put it to the correct face later. Belinda Ross. Acacia Kin-dermann. Ian Kefilwe. Jona Lee.

She felt a little odd about the deference and formality in how they saw her. She was Naomi Nagata to them, and that meant not only their captain, but also the admiral of the fleet and the leader of the underground. They also knew her as Captain Draper’s old shipmate, and there was a respect there she couldn’t quite convince herself she’d earned.

The odder thing was seeing Alex with them. One boy—Caspar, his name was—hadn’t even come over to join the *Roci*. Just to see Alex. The admiration in the boy’s face was impossible to miss. Watching them all together was like seeing an extended family that had come together for a wedding. Or a funeral. Alex hauled them all on a tour, showing them the

Roci. He called it an orientation, but it was more like showing off a prized possession. Or no. Not that. A part of his life he'd only ever been able to tell stories about, and now could point to in the flesh.

She made her exit as he was leading them down toward the machine shop, pulling herself up to the flight deck and her nearly complete work. The distraction of the new crew left her unmoored for a few minutes, finding her place and her train of thought. There was less to do than she'd thought.

She put the final orders in. *There is time to pull back*, Alex said in the back of her mind as the real one, decks below, showed his friends and compatriots something about how the *Rocinante's* PDCs reloaded or the way the power grid had been rerouted to support the keel-mounted rail gun or something.

Somewhere far below, an unfamiliar voice laughed.

This was what he'd done. Where Naomi had locked herself away, Alex had gone with Bobbie and made himself a new crew, a new family. It amazed her that he'd done it so naturally that he didn't even notice. The only reason he didn't have a place with them was that he chose not to. Even this brief contact told her that they would have welcomed him. He'd built another place for himself in the universe.

She hoped she wasn't about to take it away from him. She encrypted the orders, opened the broadcast, and sent them out.

Chapter Forty-Two: Alex

Staging was important, but Alex hated it all the same. They didn't know what was waiting for them on the other side of Laconia gate. For all they knew, the *Whirlwind* could be squatting just on the other side, ready to blast them all one by one as they came through. Sure, the intelligence they had showed it keeping close to the main planet, but that wasn't a promise. The faster they got through Laconia gate, the better off they'd be.

That sounded great until it meant trickling the assembled forces from fifty-three systems into the slow zone, bunching them together before the first one went through to Laconia, and then diving through the enemy gate one after another as quickly as they could without vanishing. Then it got a little nervous-making.

"Was it always like this?" Ian, the new comm tech, asked. He was a Freeholder born and bred. Draper Station was as close as he'd ever been to another system. "Caspar said it used to be different."

"That's true," Alex said. "It used to be different."

The station at the center of the slow zone was growing darker as the days and weeks passed. It had cooled from a point of sun-bright whiteness to a threatening shade of orange. The surface of the slow zone that had been black and featureless still had the strange aurora look. If anything, that seemed to be getting brighter.

"This is the *Deliverance*," a voice said from the open comm channel. "We have completed our transit from Hamshalim."

"Copy that, *Deliverance*," Ian said. "*Benedict*, you're clear for transfer."

A few seconds. "This is the *Benedict*. Copy that. We are starting our burn."

Two hundred of the ships had already come through. Like the *Roci*, they were making their way to the Laconia gate. The others were still stacked outside their gates with Naomi's transition order. Without Medina control to keep anyone from going dutch-man, they had to rely on her for their script. Which would work as long as not too many other ships came through in the same time frame. And as long as the behavior of the gates hadn't changed.

That wasn't the slow zone's only new risk, though. Alex could still remember coming through the Sol gate the first time. Back then, the slow zone had been a place of mystery and terror, alien artifacts and death. Before Medina, he'd have said that the decades had tamed it. Made the place into something known and understood. That it was capable of changes they didn't understand tore the scab off that wound every time he thought about it. He kept reaching for the drive control, wanting to edge the ship out through the gate just a little faster, a little earlier. He was heading to a battle with a vastly more powerful enemy, but at least that was known. Being reminded that they'd been building roads through a dragon's mouth left him jumpy.

That was the thing about hubris. It only became clear in retrospect.

"This is the *Benedict*. We have completed our transit from Hamshalim."

"Copy that, *Benedict*," Ian said. "*Chet Lam*, you are cleared for transit."

Alex reached for the drive controls, pulled back.

"You okay?" Ian asked as Alex unstrapped from his couch.

"I'm going to go get some tea. You want some tea?"

"I'm good," Ian said, and Alex pushed off for the lift. He wished they were under burn, not only because he wanted to get out of there, but because being on the float made moving through the ship too easy. If he could feel the effort of motion, maybe it would do something for his anxiety. As it was, it was just having an itch he couldn't scratch.

In the galley, he pulled out his hand terminal. There was one message in his outgoing queue, flagged to hold. He braced with his right hand and foot and spun his terminal slowly in the air like a pinwheel while he thought about it. The display, reading his orientation, flickered to keep up with its own rotation. After a few seconds, it started to annoy him. He grabbed it

again and opened the message. His own face appeared on the screen. His voice came from the speaker.

“Kit. I’m about to do something, and it seems like I might not come back. It’s risky anyway. And the last time I did something like this, I thought about you a lot afterward. I know me and your mom didn’t get along there towards the end, and maybe I haven’t been as good a dad to you as I could have been—”

He stopped the playback, looked at it for a long moment, and deleted it without sending. There was this idea that one message could change a lifetime of decisions you’d already made. The truth was, he hadn’t said anything in there that Kit didn’t already know. If Naomi’s plan worked, Alex could go back and say anything that still needed saying in person. If it didn’t, it was probably better for Kit not to have had communications from his rebel pilot father.

Belinda and Jona came in together with the subdued glow of two people who’ve been enjoying each other’s private company. Well, they were in the hours before action. Alex could still remember a time when he’d taken some comfort that way himself. They nodded to him, and he nodded back like he didn’t suspect anything. Truth was, as long as it didn’t affect the ship’s function, a little affection in the crew was probably a good thing. Holden and Naomi’s relationship had been the unstated center of the *Roci* crew for a long, long time. That was part of why losing Holden had broken everything apart.

Now, here he was, and here was Naomi, back in the ship, doing something dangerous. It almost felt like old times.

His hand terminal chimed. It was Naomi.

“Admiral?” he said.

“Captain is fine.”

“Yeah, okay,” he said. “Felt weird saying that anyway.”

“So. I’m about to do a thing.”

“A thing?”

“Speechy, rousing-the-troops thing, admiral-of-the-fleet kind of thing.”

“Ironically,” Alex said with a laugh.

“This is serious,” Naomi replied, but there was no scold in her tone. “We’re three transfers away from having the whole fleet in here. I’ve sent my group assignments to the other ships. I thought I should make a statement. Something to the crew. Did Bobbie do that?”

Alex had to think. “Sort of, yeah?”

“I was really hoping you were going to say no.”

“Nervous?”

“I think I prefer being shot at.”

“Well, if this goes well, you’ll get to confirm that. So that’s a plus?”

“Might be.”

“Okay, I’m on my way up.”

Alex took a last long pull from the bulb of tea and tossed the rest into the recycler, then pulled himself back to the central shaft and up toward the flight deck. He felt his anxiety starting to shift, but he wasn’t sure yet what it was becoming. Maybe excitement. Maybe fear.

By the time he got to his couch, Ian wasn’t on the open comms anymore. The kid looked grim, lips pressed thin and fingertips dancing at the edge of the control monitor like they were looking for something to do there. Alex gave a thumbs-up as he strapped in. He didn’t know what he meant by it apart from general emotional support.

Naomi sailed onto the deck. She was in formal blacks that looked like a uniform without quite being one. Against it, her gray-white hair didn’t look old. It looked striking. Her face was serious and hard, her movements fluid and strong. She pulled herself into her crash couch, pulled the tactical readout to her station, and looked over the data there. Her ships. Her fleet. Every eye on the flight deck was pointed toward her. She glanced at Ian.

“Open ship-wide,” she said.

“Yes, Captain,” Ian said.

Naomi cleared her throat. It echoed through the ship.

“This is Naomi Nagata,” she said. “We are about to make our transit into Laconia. We will be going into the heart of enemy territory. We all saw what the *Tempest* did to the inner planets’ combined fleet. I know that’s in your minds now. It’s in mine too.

“But what we’re doing here is different. We were not able to stop the *Tempest* when it invaded Sol—”

Stopped the shit out of it later, someone shouted a deck or two below. Cheers and hoots followed, but Naomi ignored them.

“We aren’t trying to stop the *Whirlwind*. We’re trying to move it. How exactly this will play out is going to depend on what we find when get through that gate. The exact tactics, we will be figuring out on the fly. The grand strategy, on the other hand, is set. We’re going to destroy Laconia’s construction platforms. The tool Duarte has used to make the *Magnetar* ships. To make *Storm*-class destroyers. To generate antimatter. All of that ends now. And with that, Laconia’s attempt at empire. We are going to do that.

“Every ship in this fleet has a part to play. The most dangerous role is the actual attack on the platforms. With luck, that will be us. Our battle group will be the *Storm* out of Freehold, the *Cassius* out of Sigurtá system, and *Quinn* and *Prince of the Face* out of Haza. Five ships, but we won’t be alone. Every ship, every battle group, every member of every crew will be at our backs.

“This will be a long fight. It will be hard. But it will be won. So if you need food, eat now. If you need to visit the head, you have five minutes. After that, we’re going through.”

She killed the connection to the sound of cheers. On the float, there was no way to sink back into her couch, but if she could have, Alex was pretty sure she would. He pulled up his controls, selected the course profile he’d already laid in, and typed in a message to her.

THAT WAS GOOD. DID EVERYTHING IT HAD TO.

It popped up on her monitor. She smiled thinly. A few moments later, he got her reply.

I HATE PUBLIC SPEAKING. HATE IT. NEXT TIME, YOU DO THIS PART.

GET ME A NEXT TIME, he typed, AND I WILL.

Her laugh was barely a chuckle. It was a victory, getting her to relax even that much. It was strange seeing her in Bobbie’s role. It was stranger

to realize that in his mind, it was Bobbie's role. Not Holden's anymore. He wondered what else had changed while he wasn't watching.

"All right," Naomi said loud enough for the flight-deck crew to hear. "It's time. Alex?"

"Aye, aye, Cap," Alex said. He triggered the acceleration alarm through the whole ship, waited twenty seconds for any stragglers to get into a couch, and the *Roci* jumped up, eager as he was. The gel of the crash couch pressed back, cool against him, and he felt himself grinning. His HUD marked the pathway to the gate, and he started wondering how bad it might be on the other side. As the fear of staying in the slow zone faded, the fear of leaving it for Laconia ramped up.

Behind him, another ship's drive bloomed. The *Storm*. And then the *Quinn*. The *Cassius*. They'd timed it all out to the second. He felt the needle and then the surge of the juice. It was a hard burn for him, it was going to be hellish for the Belters. For Naomi.

He kept his eyes on the drive status, on the maneuvering thrusters. They were making the transit much faster than usual, and a misfiring maneuvering thruster at the wrong moment could throw them off course and into the swirling nothingness at the edge of the slow zone. He didn't know whether that would be a good death or not, and he wasn't interested in finding out.

Without visual telescoping, the thousand-kilometer circle of the gate wouldn't have been more than a speck on the monitor before they were already through it. Almost before he could register the passage, the *Roci*'s thrusters fired. The crash couches didn't hiss so much as click as they snapped to his right and then sharply back again. Alex's vision clouded a little at the edges, the blood in his brain stirred by the shifts of inertia.

The first thing was enemies. The *Roci*'s radar was already sweeping the system, her telescopes looking for the drive plumes and her radio array listening for the transponders of Laconian ships. Already five had lit up, but they were identified as Transport Union ships with legitimate business in the system. There weren't very many points of interest in Laconia system. It was still too new for the spread of human stations that Sol system had.

There were some, though. An ice moon around the system's single gas giant had a scientific outpost on it. One of the inner, rocky planets had been mining titanium for half a decade. Rumor was that Duarte had set aside one of the Ceres-sized dwarf planets as the site of a massive art project that was underway. The first real enemy the *Roci* found was almost halfway to the empire's home. A pair of *Storm*-class destroyers already burning out toward the gate. And then, behind them, close to the planet, the unmistakable heat and energy signature of a *Magnetar*-class battleship.

Alex pushed his fingers to the control pad at his side and typed out a message.

NO GUARDS AT THE GATE. THEY DIDN'T SEE US COMING.

A few minutes later, Naomi managed a reply. OR THEY COULDN'T IMAGINE ANYONE BEING THIS DUMB.

He would have laughed if he could catch his breath. They'd been at eight gs since they came through. He'd done worse, but he'd been younger when he did it. The *Storm*, *Quinn*, *Cassius*, and *Prince of the Face* were all behind them, their trajectories making a thin fan pattern. At the gate, the first of the *Donnager*-class battleships emerged into normal space and angled off on a vector different from their own. The threshold level on Naomi's model dropped slowly on his screen, measuring mass and energy and safety. The moment it was low enough, the second battleship arrived. The light delay from the ring to Laconia was almost three hours. So everything they were seeing in system was from the past. But it also meant that the closest Laconian ship wouldn't know the enemy had arrived for a little over an hour and a half, and Laconia proper twice that. Alex didn't let off the burn. By the time the response came, their fleet needed to be scattered as far through the system as it could be.

If it had been football, Laconia would have had a world-class goalie and a couple of professional strikers against Naomi's team of four hundred grade school children and three *Donnager*-class football hooligans. Any head-to-head battle was a win for Duarte. So it was better that there not be any. Not until Naomi could pick them.

Alex switched over to visual telescopes and looked back at the receding gate. It was already tiny, but he could make out the drive plumes of the emerging ships when they came through like new stars being born. And behind them, the real stars and the wide, beautiful smear of the galactic plane. The same, more or less, as it always was.

Three hours later, the enemy destroyers killed their drives. Light delay meant that they'd seen the intrusion into their space and reacted, and the evidence of response was only just arriving. Alex wondered if they'd cut drives when they saw the *Roci* come through or if it had taken a few unexpected drive plumes lighting up their gate to make them nervous. If he'd cared enough, he could have done the math and figured it. He did enough to know that the news of their appearance hadn't reached Duarte and the Laconian capital and that it would very, very soon.

In his couch, Ian grunted. For a moment, Alex was afraid it was a medical problem. Some people reacted pretty badly to their first extended high-g burn. But then the message came from Naomi.

DROP THE BURN. WE HAVE A MESSAGE.

Alex thumbed the *Roci* back down to half a g. All around him, he heard the others gasp and sigh. He did a little of the same himself.

"Kefilwe," Naomi said. "Let's have that message."

"Yes, Captain," Ian said. "To your station?"

"I think we'll all be interested."

A woman not much older than Ian appeared on their monitors. She had sharp features, pale lips, and the blue uniform of Laconia, and her forehead was furrowed. Confused. Not alarmed.

"This is Captain Kennedy Wu of the Laconian destroyer *Rising Shamal* to the unidentified destroyer and its escort. You have made an unauthorized and unscheduled transit into Laconian space. Please cut your drives at once. If you are in need of assistance—"

Someone behind Kennedy cried out in alarm. Alex thought they said *It's the Storm* or *That's the Storm*. Something along those lines. The Laconian captain's concern changed to fear and anger in a heartbeat. Alex tried to put himself in her place. The stolen ship that had murdered the pride of her

navy, killed the unkillable, and was now showing up where it had no business being. He and Naomi knew all their antimatter supply had gone up with the *Tempest*, but he watched Captain Kennedy wonder.

“Attention, *Gathering Storm*. You are to cut engines immediately and surrender control to me. Any attempt to approach Laconia will be treated as hostile and met with immediate and—”

A different voice called out. This time Alex was sure of the words. *More contacts. This one’s big.* That had probably been one of the *Donnager*-class ships coming through. Captain Kennedy looked away from the message, checking something on another monitor, and the message ended.

“Well,” Alex said. “I think they noticed us.”

“Got to think High Consul Duarte’s going to be having a distressing day, don’t you?” Ian said.

Naomi pulled up the tactical display. The vastness of Laconia system simplified so much that all their ships pouring through the gate were a single, minuscule yellow dot.

“Orders?” he asked.

“They’re coming for the *Storm* first,” she said. “Bring us on a slower burn toward the gas giant. And get me a tightbeam to Captain Sellers on the *Garcia y Vasquez*. We’ll make it look like we’re open for a fight there, and the *Neve Avivim* can burn like hell to get around like they’re going to make it a pincer. As soon as the destroyers commit to that, we’ll change it.”

“Copy that,” Ian said.

Behind them, another ship came through the gate. Hundreds of drive plumes arced in shallow curves or wide, spreading like dust in a high wind.

The siege of Laconia had begun.

Chapter Forty-Three: Elvi

If she could have, Elvi would have moved her work someplace else. A lab of her own would have been best, her rooms with Favez a damned close second. But the data was at the university and the Pen, so that was where she went. And at first, she resented it. The breakthrough came when she could finally put aside Cortázar's work on changing Duarte and get back to her own data.

Her reports from the dead systems felt like letters from a past life. The breathlessness she'd felt upon realizing that there were literally rains of glass on the one semihabitable planet in Charon seemed almost childish now. She looked back at it and saw her own wide-eyed wonder, and even felt an echo of it. The massive crystal flower with filaments running through the petals like vacuum channels, gathering the energy of Charon system's wildly fluctuating radiation and magnetic fields like daisies collected sunlight, if daisies had been thousands of kilometers wide. She still thought the crystal flowers could be a kind of naturally occurring interstellar life. And the massive green diamond . . .

She looked at that one for a long time before she understood what she was really thinking. Then she took a tablet with the readouts and data to Cortázar's private lab. She hated being in the room with him, hated having him at her back, but she didn't have an alternative.

"Yes," Cara said, when she looked at it with her flat, black eyes. "I know about that."

Xan was sleeping. Or resting with his eyes closed, which was probably the same thing from where Elvi sat. Cortázar, at his desk, scowled at the two of them—Cara and Elvi, leaning against different sides of the clear

plastic cage like girls comparing lunches at university. He went back to eating a sandwich with an air of disapproval.

“Is there anything you can tell me about it?”

Cara frowned. Even that had a moment of extra processing that went into it. Like the girl, or the thing that had been a girl, needed to remember how to make movement first. Or maybe it was more like a kind of gross motor stutter. Elvi really needed to get back to that line of research at some point . . .

“It does . . . record?” Cara said. “That’s not the right word. It’s not like memory, exactly. It’s more like everything all at once? Like the way a film is all the pictures that tell the story, and they’re all there even when you only see one at a time? I’m not explaining this right.”

“A gestalt,” Elvi said.

“I don’t know that word,” the girl said.

Her hand terminal chimed at the same moment that Cortázar’s system threw an alert on his monitor. Trejo informing them of an emergency meeting in his offices in half an hour.

“Problem?” Cara asked.

“Too many masters, not enough time,” Elvi said. “I’ll be back when I can.”

Cortázar was already heading for the door. She had to trot to catch up. A driver waited for them outside, managing to look obsequious and impatient at the same time. A cold wind was blowing in from the east, stinging Elvi’s earlobes. It was her first winter on Laconia, and she understood it was likely to get a lot colder for a very long time before the warmth came back.

In the back of the car, Cortázar folded his arms and scowled out the window. The city was glittering, and there were banners up for some kind of cultural celebration. Elvi didn’t know what it was. The streets they passed had people rushing down them in thick coats. A pair of young men ran alongside their car for a moment, hand in hand and laughing, before a security guard in Laconian blue waved them off.

It was hard for her to remember that a whole population—millions of people—was spread across the planet, living lives in a new environment

while she tired her head in reams of data. In that, it felt a lot like pretty much every other city she'd spent time near.

"I heard you talking to the older subject," Cortázar said.

"Right?" Elvi said. "This is awesome." She lowered her voice, roughened it, and put on a fake Martian accent. "We thought it was two cases, but it's been the same case all along." Then, when Cortázar didn't respond. "Like Inspector Bilguun? How he and Dorothy were always on different investigations, and it turned out they were related?"

"I never watched those," Cortázar said. "I'm concerned about how you're treating the subjects."

"Cara and Xan?"

"You treat them like they're people," Cortázar said. "They aren't."

"They aren't rats. I've worked with rats. They're very different." Again, he didn't get the joke. Or didn't think it was funny.

"They are mechanisms created from the corpses of children. They do some things that the children did because those are the parts that the repair drones had to work with. Eros was only different in scale. The nature of the protomolecule and all the technology related to it has the same logic. On Eros, when it wanted a pump, it co-opted a heart. When it needed tools to manipulate something, it repurposed a hand. This isn't different. Cara and Alexander died, and the drones made something out of the dead flesh. When you talk to that girl, she isn't there. Something is, maybe. And it's made from parts of a human, the way I could stitch together a model catapult from chicken bones. You're anthropomorphizing them."

"Is it a problem?"

"It's inaccurate," Cortázar said. "That's all."

At the State Building, an escort led them to a conference room where Trejo and Ilich were already sitting. Ilich looked worse than usual, and the way things were, that was saying something. Trejo, on the other hand, seemed almost at ease. He gestured at the chairs, and Elvi and Cortázar sat. A display on the wall showed a map of the system—sun, planets, moons, and ships—like a virtual orrery. It seemed to her like it had a lot of ships in it.

“The research?” Trejo asked curtly. “Where do we stand?”

“Making progress. Steady progress,” Cortázar said.

“Do you concur, Major Okoye?”

“We’re finding new connections,” she said. “You don’t really know what’s critical and what’s just nifty until after the fact, but sure. Progress.”

“We’ve had a development,” Trejo said.

“What’s up?” Elvi asked.

That was how she learned that the underground had launched a full-scale invasion. Trejo brought them up to speed as quickly as he could, then opened the floor to comment.

“The thing I care about,” Ilich said, “is what they know that we don’t. That’s why this is a problem.”

“I understand your concern,” Trejo said, one palm up as if to say, *Please stop whining*.

“First, they all saw the *Tempest* stand up to their fleet. They knew what it was capable of. And we saw them destroy the same *unkillable* ship. We don’t know what else they’re capable of.”

“The readings from Sol are consistent with the full complement of antimatter resupply we sent having been used,” Cortázar said.

“And there isn’t any more missing,” Trejo said. “All that still exists is either being isolated on the construction platforms or was shipped to bomb ships in other systems. It’s possible that they’ve been appropriated by the enemy since the loss of the *Typhoon*, but we haven’t heard of any that have gone missing.”

“So if it’s not that,” Ilich said, “then what is up their sleeve that they’re willing to throw three hundred—”

“Four hundred,” Trejo said. “More came through.”

“Four hundred ships at us? Because unless they’ve all suddenly become suicidal, we have to assume they know something.”

Elvi tended to agree with Ilich’s point, if not with his tone. She also understood why Trejo seemed more at ease. After all the alien strangeness and political intrigue, a nice simple shooting war was a move back into his comfort zone. Not into hers, though.

“You let me worry about that,” Trejo said. “I’ve already been in touch with Admiral Gujarat. The *Whirlwind*’s still not at a hundred percent readiness, but she’s comfortable taking it out so long as it stays in-system. I have no interest in putting our last *Magnetar* through the gates anyway. We’re ready for this. What we aren’t ready for is the high consul’s silence.”

“Would seem strange,” Cortázar said.

“Leading a secret task force focused on the things that killed Medina is plausible,” Trejo said. “Reassuring, even. Staying silent in the face of an invasion is not. We need his face on this. No options.”

“I’m not sure how we do that,” Elvi said. “He hasn’t had a really lucid moment since—”

“We make it,” Trejo said. “I understand that this is a little below your collective pay grade, but I’m not interested in bringing a media team into the fold. We’ll scan the high consul, get recordings of his voice, and generate a message to enemy and empire. You have some experience with imaging, yes?”

“I’ve run a bunch of animals through sampling pouches,” Elvi said. “It’s not really the same thing.”

“We can make it work,” Ilich said.

“Good,” Trejo said, and stood. For a moment, Elvi thought the meeting was adjourned and started to head for the door herself. “Dr. Okoye. We’re not waiting on this. We’re doing it now.”

The scanning device wasn’t particularly bulky, but Duarte’s room wasn’t built for it. Kelly had dressed the high consul in his formal uniform and was helping him to his chair. The thought, as Elvi understood it, was that if they scanned the uniform into the same profile as the man, creating the false version would be simpler.

“There are going to be forensic traces,” Cortázar said. “There always are.”

“We have very good imaging programs,” Trejo said as he tried to fit the lighting stick into its base.

“Other people do too,” Cortázar said. “I’m not objecting to the plan. Just be prepared to discredit the people who say it’s faked.”

“Already on that,” Trejo said, and stood. The lighting stick cycled through its spectrum, getting ready to catch the subtleties of Winston Duarte’s skin and hair. He’d grown thinner since the break. His eyes still had an intelligence to them if not a focus, but his cheekbones had become more prominent. Elvi felt like she could see the skull beneath the skin, and she didn’t remember thinking that before. Kelly brushed his hair, trying to put it into place the way he probably had before other addresses and announcements. Only Duarte wouldn’t keep still. His hands were thinner, gray and dusty-looking, and he moved them constantly. His eyes rolled in his head like he was following butterflies no one else could see.

“Is there any way to make him sit still for a minute?” Trejo asked.

“He does sometimes,” Kelly said. “Having people around agitates him. Give him a little time to settle.”

Trejo muttered something but didn’t object. Elvi waited with the others, watching the man who had, however briefly, been the god-king of a galactic empire. All she saw now was a lost man. She remembered feeling the force of his personality the first time they’d met. The sense of being in the presence of something vital and irresistible. She saw something in the way his jaw fit against his neck that reminded her of Teresa. It was easy to forget that they were also people. Father and daughter. The same complicated, fraught relationship that human beings had been navigating since they’d developed language. Before that, probably.

Without really knowing why, Elvi stepped forward and took Duarte’s hand. He considered it like it was a pleasant surprise. She knelt, smiling gently, and his gaze swam through whatever dark waters he lived in now until he found her.

“We just need to scan you, sir,” she said. “It won’t hurt.”

His smile was gentle and filled with an unspeakable love. He squeezed her fingers gently and let them go. She stood back, getting out of the light and the scanning radius. Duarte looked around the room like a beneficent king in his dying hours until his attention landed on Cortázar.

“All right,” Trejo said. “Let’s get this done before—”

Duarte stood, his head tilted at an angle like he was remembering something half-forgotten. He stepped away from his chair. Ilich made a small, frustrated hiss.

“All right,” Trejo said. “It’s okay. Let’s just get him back in position and try this again.”

Duarte stepped over to stand before Cortázar. His attention seemed as focused as Elvi had seen since his fall. Cortázar smiled and bowed his head like it was something he knew he was supposed to do. Duarte’s jaw worked, his mouth opening and closing, but the only sound he made was a small *oh*. He moved his hand in a soft gesture, like he was fanning away smoke, and Cortázar’s chest bloomed out at the back. It was so slow, so gentle, that Elvi couldn’t understand what she was seeing. Not at first.

It was as if Cortázar were an image projected on mist, and the mist was being blown away. Nothingness swirled through his chest, his face. And behind him, floating on the air, spirals of red and pink, gray and white, as ornate and beautiful as ink dropped into water. The air filled with the smell of iron. Of blood. Cortázar sat on the floor, his legs folding under him, and then slumped to the side with a long, wet exhalation. The left half of his head was missing from the jaw to the crown. His heart was still trying to beat in the open theater of his ribs, but the man was gone.

They were silent and perfectly still. Duarte looked up, his attention caught by something that made him smile like a child seeing a dragonfly, and his hands rose aimlessly. Trejo put the scanner down on the bed, turned, and walked quietly out of the room, pulling Elvi along with him. Ilich followed, and then Kelly, shutting the door behind them. They were all pale. The State Building was shaking under them, tremors that matched Elvi’s heartbeat. She fought to breathe.

“All right,” Ilich said. “Okay. That happened. That just happened.”

“Major Okoye?” Trejo said. His normally dark face was pale and gray.

“I have never fucking seen anything like that. Ever,” she said. “Holy *fucking* shit.”

“I agree,” Trejo said.

“He knew,” Elvi said. “That’s what this was. He knew about Teresa. Did you tell him?”

“What about Teresa?” Ilich asked. “What did he know about Teresa? What did she have to do with this?”

“Let’s not lose focus here, people,” Trejo said, leaning against the wall. “Mr. Kelly, would you escort the high consul to fresh quarters until we can get these cleaned?”

Kelly looked like Trejo had just asked him to put his hand in a meat grinder to see if it was running. For a moment, Elvi thought the man would refuse, but Laconians were a breed apart. Kelly nodded and walked stiffly away.

“We can do an announcement without him,” Trejo said. “I can do it. As his . . . acting military commander. Pleased to accept the position. Thank him for his faith in me. Like that.”

“We need to shoot him,” Ilich said. “Whatever that thing in there is? That’s not the high consul. I don’t know what the hell it is, but the only sane thing any of us can do right now is put a bullet in its brain.”

Trejo drew his sidearm, took it by its barrel, and held it out toward Ilich. “If you’re sure that’ll kill him, be my guest.”

Ilich hesitated, then looked away. Trejo holstered his pistol. “Major Okoye.”

“I know,” she said. “Another top priority. I’ll get right on it. But . . .”

“But?”

“I know you told Cortázar to give me full access. I’ve never been entirely certain he did.”

Trejo considered it. From the far side of the door, something rattled. A thump, like a piece of equipment had been bumped into, knocked over. If it had been a sound of violence, it would almost have been better. Trejo pulled out his hand terminal, thumbed in a code, and adjusted something she couldn’t see.

“Major Okoye, you *are* Paolo Cortázar. You want to go through his room and check his underwear, you go right ahead. See what he’s been eating. Check his medical records for sexual diseases. Read his letters to his

God damn mother, I don't care. That man's life is an open book to you starting now. Find something useful in it."

"I'll do what I can," Elvi said.

"And Major? I know you were a civilian before you were appointed. You didn't come up like the rest of us, so I'm going to make this clear for you. If you say one more word about surrendering the empire? I will have you before a court-martial, and then I will have you shot. This is a war now. The rules have changed."

"Understood," Elvi said. "They've been doing that a lot lately."

"Ain't that the God damn truth," Trejo said. Then, "Colonel Ilich, you're with me. Let's draft this announcement."

Elvi walked out of the State Building like she was in a bad dream. Even the bite of the wind felt less real to her. Shock, she thought. I'm in emotional shock. That happens when people die in front of you.

At the lab, Dr. Ochida waved to her as she passed, and then looked concerned when she didn't wave back. She knew that she should have stopped and talked to him, but she didn't have any idea what she'd have said. In the private lab—*her* private lab—Xan and Cara were sitting in their cage playing a word game they used to pass the time. They paused when she came in, but didn't ask her what had happened. What was wrong.

The uneaten half of Cortázar's sandwich was still on his desk, wrapped in brown paper. Elvi threw it in the recycler and opened her work environment. All the reports and data feeds she'd been poring over for weeks. She split the screen and, with her new permissions, pulled up Cortázar's. She backed both up to the functional index.

His was a hundred and eighteen entries longer. Elvi felt something like anger, something like dread, something like the mordant pleasure that comes from being proven right about something shitty.

"What an asshole," she said.

Chapter Forty-Four: Naomi

The burn was long and it was punishing. Even with the crash couch distributing the pressure along every possible square centimeter of her body, Naomi ached her way through the hours. The only solace was the breaks for food and the head, and she kept those brief.

Laconia was a slightly smaller heliosphere than Sol, with nine planets, only one of them habitable. A single gas giant with somewhere between eighty and a hundred moons, depending on where the line was drawn. Two large planets out past that in the deep, and a rocky captured planet hardly larger than Luna with a retrograde orbit that swung high above and far below the plane of the ecliptic. Five planets in closer to the sun, the second of them being her target and the heart of the empire. A transfer station at the gas giant, and the alien construction platforms that orbited the inhabited world. That was her battleground, and she meant to have her forces diffused through it. On the enemy's side, the *Voice of the Whirlwind* at Laconia proper, the *Rising Shamal* and her sister ship, plus four more *Storm*-class destroyers.

Her couch on the burn was almost as isolated as her old shipping container. Her time, even if it was painful, was her own. She studied the maps until she could see them with her eyes closed.

And in the back of her mind, Bobbie waited. The memories and habits of decades spent breathing the same air, drinking the same water, being part of the same organism had made the woman a part of her. And the Bobbie in her head had a lot to say.

A campaign like this is an argument. You're trying to persuade the enemy of something. Talk them into it. And this time, here? You need to

teach them that the danger of staying in place is greater than the danger of coming after you. For it to work, every lesson needs to support that one single thought.

The Storm-class destroyer Mammatus ended its assignment in Arcadia system and rotated back to Laconia for resupply. The transit from Arcadia to the ring space was uneventful, apart from the now-familiar annoyance that the most recent set of repeaters had been sabotaged.

The Mammatus' transit into Laconia was very different. The moment the destroyer emerged into normal space, its sensor arrays were swamped by massive jamming from multiple sources. Half a dozen ships positioned just outside the ring gate flooded the Mammatus with radio and light. It took fewer than three seconds for the ship to reset, but by then five torpedoes—already launched and waiting for a target—were slamming into the ship. Informed by months of analysis of the captured Storm, the torpedo strikes were devastating. The Mammatus lost maneuvering thrusters along her port side and six PDC emplacements. Worse, it began venting atmosphere.

Its counterstrike was late and weakened. The enemy PDCs took out the torpedoes as soon as they were launched, and with its mobility limited and its port vulnerable, the destroyer fled. Its burn toward Laconia and the prospect of safety was the obvious strategy, and easy to foresee. Compromised as it was, it failed to register the field of stealth composite-coated debris in its path until a swarm of uranium micrometeorites peppered its already-stressed hull, peeling back a section of the plating. A maneuvering thruster misfired as the power grid tried to compensate, sending the destroyer into a spin. Despite all that, it took five more torpedoes and a constant stream of PDC fire to kill it. The Mammatus fought well and died ugly, but it died. Everyone in the system saw its last hour, even if the light delay meant they saw it far too late to act.

Lesson one: You can't rely on reinforcements.

Days under burn stretched. Naomi slept when she could, studied the movements of the enemy and the reports of her fleet when she couldn't. Her knees ached from being bent just slightly backward by the acceleration. It hadn't all been in the same direction. Twice now, Alex had shifted them. Not a full flip-and-burn, but a change of vector that brought them closer to the gas giant. The Laconian destroyers in the system started a burn to match, and Naomi's three *Donnager*-class battleships—the *Carcassonne*, the *Armstrong*, and the *Bellerophon*—had redeployed as if to make a full engagement just outside the transfer station there. And then they had all broken off, scattering, while a dozen smaller ships dove sunward to the inner planets. The *Whirlwind*, capable of slaughtering any of them, stayed in place, leaving the chase to the destroyers.

She'd expected the battleships to draw off the Laconian forces, but they didn't. The destroyers followed her hunt group, pushing them to a long, arcing retreat up above the ecliptic. The destroyers turned back quickly, never venturing past the gas giant's orbit. It wasn't the repositioning she'd wanted, but it worked. It would do.

When the burn paused, she took a long moment before she unstrapped, just to enjoy the physical relief of a gentle half g. Walking down the hall to the galley, her legs felt shaky and her neck ached.

The others—her crew—were already there, wolfing down bowls of noodles and mushrooms, talking and laughing. They sobered when she came in. She was the adult. The commander. Who she was mattered less than what.

She didn't mind that.

She found Alex in the cargo bay, opening an access panel. He looked like he hadn't showered in days. Probably he hadn't.

"Issue?" she asked.

"No. We're good. I was just getting a little less pressure on the water feed to this thruster than I'd wanted. Thought I'd tweak it while I had the chance."

“Good thought.”

“I was hoping we’d be getting down to the inner planets by now.”

“Early days,” she said. “There’s time.”

The Bhikaji Cama lumbered through the void, well behind the other ships. Its hold was open to the vacuum.

Two groups of ships, eight in one and fourteen in the other, fired long-range torpedoes at the transfer station. The missiles burned hard, then went ballistic. Slightly fewer than three hundred warheads screamed through the black, all aimed at the transfer station, and all timed to arrive within seconds of each other.

And all of them, of course, were intercepted. Most were killed by the transfer station’s PDCs, but a handful also fell to long-range countermissiles launched from the Whirlwind. It didn’t use its field projector, and wouldn’t. Despite its power, the range was short, and the last time one had been fired in normal space, Sol system had lost consciousness for three minutes. The Laconians didn’t want to risk their defense with a blackout.

When the last of the torpedo barrage died, the expended hunt groups looped back, burning for the Cama. There the crew put on mech suits and loaders, made their way into the cargo ship’s vast belly, and came out with fresh torpedoes and water and PDC rounds.

A week and a half into the campaign, at the time Naomi had specified, the Verity Close—sister ship to the Bhikaji Cama—made the transit into the system and bent its path to the opposite edge of the system and opened its hold.

Lesson two: We have thirteen hundred systems to resupply us. You have one.

“They’re following the *Storm*,” Naomi said. “I need to split you off.”

On the screen, Jillian Houston scowled. “When the time comes, and you lure that murderous bastard of a ship away from Laconia, you’re still going to have a planetary defense system trying to shoot you down. That’s at minimum. You need me to eat that flak for you.”

“If you’re with the attack group, the *Whirlwind* won’t budge. Not ever. I don’t like it any more than you do, but your ship used to be theirs. They know it’s the best tech in our fleet. They’re not going to take their eyes off it. They think you’re the number one threat because you are.”

Despite herself, the younger woman smiled. “They’re right about that.”

“I’m redeploying you. Move to accompany the *Armstrong*. When the time comes—”

“I’ll be part of the bait,” Jillian said. “I don’t love it.”

“It’s a risk. But it’s worth it.”

“Understood,” Jillian said, and dropped the connection. Naomi stretched and checked her system. Eight more minutes before the next burn. She tried to decide if she wanted to wash off or get a bulb of tea. If she didn’t pick soon, she wouldn’t have time for either.

Or maybe she could do both.

“Alex. Postpone the burn for half an hour. There’s something I want to do.”

“You bet,” Alex said.

Naomi went down to her cabin and her private shower, the map of the system in her mind. With the *Storm* on its own, she could reroute the *Carcassonne* and fifty or so of the other, smaller ships toward the transfer station. The *Roci*, *Quinn*, *Cassius*, and *Prince of the Face* would be a minor threat and could loop down sunward, using the innermost planet as a gravity assist.

There was a way that the whole process was like playing golgo. Judging her shot, how the ball would bounce and spin off the other balls, how the next person would react to that. How each decision changed the state of the table. The Bobbie that lived in the back of her head said: *A challenge of intellect, technique, and skill.*

Naomi saw how easy it would be to forget that the stakes were people's lives.

When the Laconian capital was surrounded—ships answering to the underground and the Transport Union at every angle through-out the system—the barrage began. The transfer station was forgotten. Not just long-range missiles, but rocks. Cheap, deadly. Every ship in the group sending nukes and accelerated titanium rods and holds full of gravel into intersecting orbits. Some moved fast, some would take months to arrive at Laconia—which was a message in itself about how long the underground was prepared to draw out the fight. Nothing targeted major population centers, but there was no way for Laconia to know that for sure. To be safe, they had to defend everything.

The barrage kept going, day after day. Rock after rock to intercept. Torpedo after torpedo to shoot down. An endless rain of threats, wearing them down hour by hour by endless hour. That was the third lesson: Playing defense means being endlessly ground down. Someday something will get through.

The Whirlwind stayed in its place, guarding the gravity well over Laconia, but the destroyers ranged farther and farther. When the enemy came too near, Naomi's fleet scattered like children running from the police. Not everyone escaped. The Tucumcari, a rock hopper retrofitted to fight pirates in Arcadia, caught a torpedo on its drive cone and died in a ball of fire. The Nang Kwak, a private security company stealth ship two generations out of date, didn't dodge a line of PDC fire. Disabled, it tried to surrender. The Laconian ships destroyed it instead. There were others. A handful. Each of them one too many. And every chance Naomi had to strike back at the enemy, to lure them out and end one or two of them, she let pass. It was the cardinal rule that she sent to every ship, all through the system. Laconian military that came out after them went home intact.

Because that was the final lesson she taught her enemy: It's safe to chase after us. It's how you'll win.

And it was a lie.

The first sign of fresh cheese in the mousetrap was the *Bellerophon* changing its drive signature. The *Donnager*-class battleship was burning away from Laconia, heading in the rough direction of the *Verity Close*. Even from half the system away, the drive plume would have been visible to the naked eye, a faint but moving star.

And then, for a moment, it blinked out.

The *Roci* and her three escort ships were on the float, skating on the far side of the sun from Laconia. She'd led them in toward the corona until even with pumping spare water onto the ship's skin and letting it evaporate, the built-up heat was at the edge of tolerance. Even when the temperature was in the error bars of normal use, it baked the resins and ceramic. The air smelled different, and it left Naomi and the rest of the crew jumpy and uncomfortable. But with Laconia's fighting ships near the planet, they were in a blind spot. Out of sight.

When the *Bellerophon*'s drive lit back up, it was dirty. Half a minute after that, it went off again. The way an apex predator lured lesser hunters by mimicking the sound of wounded prey, the *Bellerophon* called out for help. And Naomi's fleet answered. The *Storm*, the *Armstrong*, the *Carcassone*, and almost a quarter of the other ships started burning on courses that would meet the *Bellerophon*. The *Bellerophon* wasn't halfway to the *Verity Close*, but the light delay from it to Laconia was still over seventy minutes.

A malfunctioning ship would be interesting to Duarte and his admirals. An escort fleet coming to its aid looked like something more. It looked like a mistake. And an opportunity.

"Come on," Naomi said.

"Should I start up?" Alex asked.

“Put us at half a g,” Naomi said. Even if it didn’t work, they’d want to be out of here soon. As comms officer, Ian passed the word along to the other ships, and the *Roci* eased up from beneath her.

Two hours later, the *Whirlwind* moved. At high burn, she headed out toward the *Bellerophon* and the gathering escort ships. For anyone who’d seen the *Tempest* destroy the combined forces back in Sol, it was like seeing a shark darting toward a beach full of toddlers.

Three hours after that, several hunt groups on the other side of the heliosphere started burning in toward Laconia, and the destroyers went on intercept courses, ready for a slice of their own glory.

There was a point long before any battle came that was her window. Not just how long it would take the *Whirlwind* to get back, but how long it would have to decelerate before it could even start to reduce the distance to Laconia again. And the same for the destroyers. It was a window of time defined by mass and inertia, thrust, and the frailty of the human body. The time it would take even long-range torpedoes to reach them. Naomi ran the numbers, and she knew when they would see her and her little force diving in from sunward. And that it would be too late.

“Alex?”

“Ready when you are,” he said.

“Let’s go.”

The burn was punishing, and it lasted hours. The distance from the sun to Laconia was slightly less than an astronomical unit. If they’d kept the burn going the whole distance, they’d have snapped by Laconia too quickly to see it. The flip came at the halfway point, and the braking burn was just as bad. Worse, because now the planetary defenses had seen them. Torpedoes darted out toward them, and died in the web of four ships’ coordinated PDCs.

The planet itself was beautiful. Blue and white as Earth, with a greenish cast at its edge that was almost pearlescent. Naomi could make out the clouds. A cyclone forming in its southern hemisphere. The jagged, black-green line of its coast where the forests stood. Naomi fought to keep them in focus. The force of the burn was deforming her eyes.

THE WHIRLWIND HAS TURNED. STARTED ITS BRAKING BURN. IS FIRING LONG RANGE.

The message was from the sensor ops. One of the new people. She checked it herself all the same and agreed. If this didn't work now, it wouldn't work later. This was her only shot. Fingers aching, she sent a message to Ian, suffering in the next couch over. SEND THE EVACUATION ORDER. EVERYONE GOES FOR THE GATE NOW.

She heard him grunt and took it as assent.

Alex shouted, his voice strangled by effort and the g forces pressing at them. "Rail-gun fire. Brace. For. Evade."

The *Roci* bucked, lurched. At this distance, the rail-gun fire could still be dodged. The closer they came, the harder that would become. She pulled up the targeting arrays, and the beautiful blue-green sphere sprouted five red lines, as bent as tree limbs. The platforms. The targets.

TARGET ALL FIRE ON THE PLATFORMS, she typed. FIRE AT WILL.

It was too soon, but only by a little bit. And there was a chance for a lucky shot. Every second they spent in the firing arc of Laconia was another chance to die. Worse, another chance to fail.

INCOMING TORPEDOES FROM THE WHIRLWIND. ETA 140 MINUTES. Naomi deleted the message. By then, everything would be over.

"Cut the brake," she shouted. "Do it now."

The *Roci* fell onto the float and snapped around 180 degrees, ready to accelerate again. Ready to flee as soon as the enemy was finished. There would only be one run past the planet. If they missed, they lost.

The ship jerked, and Alex took them out of the path of another rail-gun round. The chatter of the PDCs ran through the flesh of the *Roci* like the ship was talking to itself and it was angry. Naomi's jaw ached with the tension and fear and the joy. The small, jagged red lines grew a fraction larger.

"Captain?" Ian said. "I have something."

"Not as helpful as you think," Naomi snapped. "What do you have?"

“I’m not sure,” Ian said, and passed the comms controls to her monitor. It was an incoming message from the surface of Laconia, coded with an out-of-date underground encryption schema. An evac request.

Amos’ evac request.

“Alex?” she said, and the ship jumped again, slamming her left and then right again, her crash couch whipping like the seat in a carnival ride. “Alex?”

“I see it,” he shouted. He was out of breath. “What do we do?”

Chapter Forty-Five: Teresa

The *Mammatus* died, burning through Laconia's gate and being dismembered by the enemy ships, two nights before her birthday. The celebration was held in one of the minor ballrooms, with the same tasteful and understated decorations she always had. Silk banners with bright designs, glass candles that she'd loved when she was eight and been saddled with ever since, flowers raised in hydroponic farms in the city proper.

Soft music played over hidden speakers, all of it by composers and performers living on Laconia. Half of the guests were politicians and cultural figures—adults who'd come mostly to say they'd been there and to see who was in favor. The other half were her peer class and their families. They were dressed in stiff formal blues, just like she was. None of them seemed happy to be there. That was fair. To them, it was like having to go to school an extra session. They were nice to her. They had to be.

The sense of strained pleasure almost made her happy. All the adults had smiles like masks. They made a show of congratulating her, as if not dying for fifteen years in a row was an achievement to be proud of. But even while they pretended to be impressed by how mature and composed she looked, their eyes were darting around the room, trying to find her father. She had to play her role, but at least so did they. No one talked about the invasion. Not even Carrie Fisk, wearing a champagne-colored gown and a fixed grin, looking like she wanted to bolt for the door. Camina Drummer wasn't there, and Teresa wondered what had happened to her. Either she'd lost control of the Transport Union and wasn't anyone anymore, or she'd

been part of planning the invasion, in which case she was lucky if she wasn't in the pens.

Teresa didn't care. She had her own problems.

It was still thirty interminable minutes before the dinner was served when Ilich escorted her to the dais at the back of the room. The crowd got quiet without being prompted. Like they'd been trained. She'd been trained too. She knew what to do.

"I want to thank all of you for coming tonight," she lied with a smile. "I am honored to be in your company now, and for all the years that I've lived here among you. My mother, as you all know, died when I was very young. And my father carries his own burdens. He can't be with us here tonight because his duties to all of us don't allow him time even for simple, honest pleasures like this."

Plus which, he's out of his fucking mind. Lost to all of you and to me as well, but I'm the only one who knows it, you poor fuckers. She grinned widely at the pattered soft applause, taking an angry pleasure in the raw perversity of the situation.

Teresa caught sight of Elvi Okoye in the back of the room. Yellow gown, and her husband at her side. She was holding a wineglass in her fist like she was trying to break the stem. She knew too.

"All of you have been a family to me as I grew up," Teresa said. Ilich's words didn't sound like something she'd say, but none of them knew her well enough to catch it. "I am humbled. And I am grateful." Another round of applause, and Teresa bowed her head like she was actually grateful. Like she actually cared whether the enemy ships burning from the edge of the system reduced everyone in the room to ash.

You're one of the angriest people I know. She wore the words now like a shawl, smiled and made her little bows as if they weren't statements of contempt.

"Please enjoy this evening as both my guest and my father's," she said, and stepped down. The guests turned back to each other, oppressed and anxious and thinking less about her than the return of the *Gathering Storm*

and its pirate fleet. Reminiscing less about Teresa Duarte's childhood and more about the violent death of the *Heart of the Tempest*.

Teresa made her way across the ballroom, avoiding Ilich and Connor and Muriel. She found Elvi and her husband not far from where she'd seen them. From the dais, Elvi had looked stressed. Close up, she looked angry.

"Is everything all right?" Teresa asked.

Elvi started, snapped out of whatever other place her mind had been by Teresa's voice. For a moment, she didn't speak, and when she did, it wasn't convincing. "Fine. Everything's fine."

"Well," Teresa said. "Except."

Elvi nodded, the movement hinging in her chest so that it seemed less like agreement, more like someone preparing for violence. "Yes. Except," Elvi said.

The chime rang, calling them all to the dining room like the most privileged cattle in the universe. When they started walking, Teresa stayed at Elvi's side. Her husband was using a cane and wincing as he walked. That was fine. Teresa wanted to go slowly.

"I was wondering, Dr. Okoye," Teresa said. "The *Falcon*."

Again, it took Elvi a moment to come back. "What about it?"

"I wondered how the repairs were going. With everything that's going on . . . I mean, it is built for sustained high burn. It has breathable liquid crash couches."

Elvi shuddered.

"Those are unpleasant," her husband said.

"But still. If the fighting got close? You'd be able to use it to get away?"

Elvi and her husband exchanged a look that Teresa couldn't quite read. Like there was another conversation going on that she couldn't quite hear.

"Unfortunately," Elvi said, "the *Falcon* was deeply, deeply compromised."

"I got a new foot, toenails and all," her husband said. "But that ship's still in pieces."

"I really don't think it'll come to evacuation," Elvi said. "None of those ships are even going to get close to the planet. And everything Admiral

Trejo has at his disposal will be used to keep us all safe.”

“Maybe you should put a push on the repairs, then,” Teresa said. It came out sharper than she’d meant it to, but Elvi laughed. That was interesting.

“Maybe I should,” she sighed, and then they were in the dining room, and Teresa was escorted to the high table with Ilich and a half dozen guests more honored than Elvi Okoye.

The meal was a feast. Fresh pasta. Lobster tails taken from actual lobsters. Gently marbled steak grown from the finest samples. The centerpieces were all Laconian flowers, and they smelled of mint and iron and resin. No one asked after Dr. Cortázar. That, Teresa had come to understand, was one of the unwritten rules. When someone disappears, don’t ask why. She wondered if they’d mention her after she left. Assuming she could find a way.

She looked over at the table where Elvi Okoye sat. Her husband was telling a story, his hands shifting in exaggerated gestures for the delight of their tablemates. The doctor was lost in her own thoughts. Teresa wondered whether they’d been lying about the *Falcon*. She wasn’t sure, and she wasn’t even sure how she’d find out.

Regretfully, she discarded the plan to have them escape the invasion and take her along. She’d have to find another plan.

Days passed. Weeks. The invasion proved harder to stop than anyone liked. The state newsfeeds kept a brightly optimistic view, treating the threat as more of an annoyance by disgruntled idiots than an actual danger to the empire. She still had the access her father had given her to high-level secret reports and briefings, but even if she hadn’t, she’d have known the reports were bullshit.

Apart from the peer class, her lessons were ignored now. She only saw Ilich at meal times. He didn’t repeat his threat to force-feed her, but he didn’t need to. She understood the terms of their relationship now. Having

lost control over so many other things, he made up for it by controlling her. There was nothing she could do about it.

“They’ve slipped this time,” Ilich said. “They panicked. That great huge ship of theirs lost part of its magnetic bottle, and they’re all going to defend it.”

“That doesn’t seem like a bad idea,” Teresa said, forcing herself to take another spoonful of the corn chowder. It should have tasted good, but the texture was slimy and it was too sweet. She swallowed and didn’t gag.

They were sitting in an enclosed courtyard with ivy growing up the walls and artificial lights that mimicked the sun. The actual weather was a snowstorm that was covering the gardens in white up to her ankles. Muskrat had been running through it with a wide canine grin and little balls of ice forming on her coat. Ilich hadn’t let her in with them while they ate because she stank of wet dog.

“It wouldn’t be if there was any way for them to actually mount a successful defense. They’ve survived as long as they have by running away. We could kill any of them whenever we chose to, but Trejo was waiting.”

“For what?”

“For this,” Ilich said. He did love the sound of his own voice. The calm, patient instructor unfolding for the clueless little girl how the universe really worked. It had seemed like kindness for so many years. Now it looked like condescension. “The three Martian battleships are the irreplaceable core of their makeshift fleet. And when you have something that important, it’s natural to try to protect it. But it’s an emotional response, not a tactical one. And that’s why they’re going to pay for it.”

He had said all the same things at breakfast—eggs, sweet rice with fish, seared spinach with almonds—and she let him repeat himself now. Nothing he said mattered to her anymore.

“The *Whirlwind* will go through them like they weren’t there. There’ll be some cleanup afterward. We won’t get all of them. But their major ships? They’re even putting the *Storm* in harm’s way for this. It’ll be a bloodbath. And I—”

His handheld chimed. Ilich scowled and accepted the connection. Teresa put down her spoon and took a sip of water. Trejo's voice was clear, and it was tense.

"I'd like a word with you in the tactical office, Colonel."

Ilich didn't speak, only nodded, rose, and walked away. Teresa was forgotten behind him. Which suited her just fine. When he was around the corner, she got up and opened the door for Muskrat. The dog trotted in, huffing under her breath. Teresa took out her handheld and opened the tactical reports.

There was a moment of sorrow. They came now and then. The memory of her father telling her that she could be the leader they needed her to be. That he wanted to train her with all the things he knew, just in case. She'd been a different girl then. He'd been a different man. She missed both of them. But the pain faded quickly, and she didn't lose anything by letting it go. It always came back.

The tactical reports were strange, and it took her a moment to understand what she was looking at. The broken-down battleship had repaired itself somehow. And the fleet of enemy ships was running away, but not for the far edges of the system. They were going to the gate. Most of them, anyway. Almost all of them.

All of them but four. And those were in a path to Laconia. It was suicide. Four ships against the *Whirlwind*. Unless they had a secret weapon the way they had in Sol system . . .

But no, the *Whirlwind* couldn't stop them. It had already gone too far, and even with the braking burn, its vector was still away from the planet. It was fighting its own mass and momentum like a swimmer struggling against the outgoing tide. The destroyers were in the same position. They'd been tricked. Lured away with only the planetary defense grid to protect them.

Which, in fairness, it probably could. Four ships weren't much. They'd do some damage, though. And there was only one target. She was sitting in it.

She knew she should be scared, but she wasn't. She put down her handheld, scratched Muskrat's back, and thought. It didn't even feel like solving a problem so much as remembering something she'd always known. She pulled up a map of the system and added in the enemy ships, their burn times. A lot would depend on how they made their braking burns, but Ilich had taught her enough about battle tactics that she could make an educated guess. Make a plan. If she called the enemy down, they'd kill her or take her as a prisoner. She needed something she could trade for passage. She didn't know what that was.

And then she did.

Muskrat looked up at her when she laughed. The thump-thump-thump of the dog's tail against the ground was reassuring. Without thinking, Teresa took another spoonful of chowder in her mouth, frowned, and sprinkled some salt over the bowl.

Her next bite was better.

The timing was bad, but it could have been worse. She left out the window as if she were sneaking out to see Timothy again. It felt familiar. Comforting. She knew it was the last time she'd see her room or her things. The last time she'd sleep in the bed that had been hers since she was a child. But her father had been dead for months, and it turned out she'd already done her mourning.

Muskrat whined as she slipped out, dancing from one paw to the other.

"You can't come this time," Teresa said. "I'm sorry."

The dog whined, lifted graying eyebrows, and wagged hopefully. Teresa leaned back in and gave Muskrat one last long hug. Then she was out the window and gone before she lost her resolve.

The first step—the hard one, really—was getting to the cell. It was night. The snow was still falling lightly, but it wasn't up past her shins. Getting out wouldn't be the problem.

There were two guards watching over the cells, a man and a woman. They braced as she walked into the room.

“I wish to speak with the prisoner,” she said.

They looked at each other.

“I’m not sure—” the man said.

Teresa made an impatient sound. “Trejo has asked me to question him before. It’s about the assault. We don’t have time.”

The fear did it. The sense of an enemy almost at their gate, and the confidence that someone in power was taking care of it. Even if the voice of authority had just turned fifteen. They led her into the cell. She felt shaky with excitement. It was like being one of the adventurous women she’d watched on her screens, only it was real. She was doing it.

Holden sat up, blinking against the sudden light. His hair was standing at odd angles and his face had pink lines across it from the pillow. Teresa turned to the male guard.

“You stay,” she said. Then to the woman, “You have something to subdue him? An electrical prod?”

“Yes,” the woman said.

Teresa held out her hand, and the woman drew a black, shining weapon with a grip all along its length. It looked like an ear of burned corn. The female guard showed Teresa where the safety was and how to trigger it.

“That’s really not called for,” Holden said. “Whatever this is? I’m not going to fight it. You won’t need those.”

“I’ll decide that,” Teresa said. She nodded the female guard out. Then it was just the three of them: Teresa, Holden, and the male guard. It was the last chance to turn back. She could still change her mind . . .

Teresa flipped the safety clear.

Holden flinched, prepared for the pain and shock, and Teresa drove the weapon into the guard’s belly and pulled the trigger. He went down hard, not even trying to catch himself.

“Okay,” Holden said after a long, stunned moment. “That was weird.”

“We don’t have much time. Come with me.”

“Um . . . no? I mean, I think I’m going to need a little more explanation about what’s . . . ah . . .”

Teresa felt a burst of anger, but there wasn’t time for it. She started stripping the male guard’s uniform off, undoing zippers and buttons, tugging at his sleeves.

“Your people are coming. Your old ship. The whole invasion was a ruse get them close.”

“There’s an invasion?” Holden said. And then, “They don’t tell me much. But you’re saving me?”

“I’m *using* you. I need to leave. You’re my ticket onto those ships. Now hurry. We don’t have time.”

Holden pulled the uniform over his prisoner’s jumpsuit. Confinement had left him thin enough that the extra cloth just about filled out the difference. Teresa took the stunner from the fallen guard’s belt and his access key, and opened the door. They marched out together. The woman at the guard’s station had time to look confused before Teresa put her down.

“This is actually happening, right?” Holden said as she led him down the hall toward the forensics lab. “Because this is a very realistic dream if it’s not happening.”

“This is happening,” Teresa said. And she meant, *I’m really doing this*. “I have an implanted tracking device. They’re going to be after us as soon as we go.”

“Okay,” Holden said.

“Here,” Teresa said. The door was locked, but the access key opened it. She stepped into the dim room. Timothy’s belongings had been moved around in the weeks since she’d been there, but they hadn’t been taken away. She walked from table to table, her fingertips brushing each container they passed. It was here. Someplace. It was right here.

“Hey,” Holden said. “This is . . . the pocket nuke? The one Amos had?”

“Yes,” Teresa said.

“And I’m standing right here next to it.”

“You are.”

“And you’re comfortable with that,” he said. “This is a *really* weird night.”

She found what she was looking for. The screen glowed as it powered up. She felt the seconds slipping away. Somewhere far above the planet, the rebel ships were already coming close. Already engaging with planetary defense. The files came up, lockouts and protections broken weeks ago. She looked for the file for evacuation protocol and, without hesitating, shifted the call to active.

“What was that?” Holden asked.

“I called for evac,” Teresa said, liking how adult the word felt in her mouth. Not *evacuation*. *Evac*. “All we have to do is get to the pickup.”

“Sure,” Holden said. “Sounds easy.”

Chapter Forty-Six: Elvi

Going through Cortázar's hidden files was the work of days. It was horrifying. Winston Duarte had believed in Cortázar's ability, but more than that, he'd assumed that he had the man's loyalty. And that the things Cortázar told him were true. The experiment to change Duarte's body using the tamed protomolecule had been the worst kind of science—uncontrolled, unethical, speculative, and risky. He had overstated his certainty to Duarte, underplayed the risks, moved ahead on therapies based on best-guess understandings of Cara and Xan, and collected data obsessively. His notes and records read like a horror story.

As the unexpected changes had come—Duarte no longer needing sleep, developing new senses—Cortázar's comments shifted. Elvi wasn't sure the man himself would have seen it, but a plaintive quality started coming into them. A sense of jealousy about all the things he could only experience secondhand. A hunger was growing in Cortázar's mind that he didn't seem aware of.

Elvi tried to go through it all in more or less chronological order, but that was harder than it sounded. For one thing, the enemy fleet in Laconia system shook her concentration. Trejo was reassuring. No more antimatter was missing, and the mere nuclear warheads raining down on the planet were a trivial danger, easily avoided. Elvi started having nightmares about it, and her sleep suffered.

Also, chronology wasn't how Cortázar had structured his work. Notes and results on the protomolecule-modified telomerases that had been one of the first steps were in the same files as preliminary scans and data on Teresa Duarte. NIR and magnetic scans of Cara and Xan from his initial research

had annotations about Duarte's blood protein structures from as recently as the day before Cortázar died.

There were some advantages. Bouncing back and forth in time, Elvi began to feel the shape not only of Cortázar's obsession but also of the path he'd gone through. The change. His earliest notes on Teresa had been much like his plan for Duarte with some variations. His decision to instead kill her and give her to the repair drones hadn't come until fairly recently.

It was almost out of character too. Everything she saw about Cortázar had been about pushing forward, trying things that were new. He was a discoverer at heart, and the choice to pull back and study something foundational more deeply was unlike him.

It was a long time before she figured out who had convinced him to change from his usual strategy.

When she did, she only told Faye.

"Holden?" her husband said, incredulous. "James Holden put Cortázar up to killing Teresa?"

"I don't know," Elvi said. "I think so. Maybe."

They were getting ready for Teresa's birthday party. The dress Elvi had ordered up was a yellow that had looked good on the screen, but she wasn't sure about it now. It was the first time she'd seen Faye in days. She'd been going to the labs early and leaving them late. Would have done so again if Trejo weren't insisting on keeping up appearances. Between Duarte's conspicuous absence and the breaking news that the enemy had gutted a destroyer called the *Mammatus*, it was a harder and harder job.

"That doesn't make sense," he said, but the way he said it meant he believed her. "Why? Why would he do that?"

The note hadn't been hidden. It was in with Teresa's medical scans and blood data, as simple and open as a reminder to get fresh socks. *Holden's argument correct? Consider restarting protocol with additional subject.* And every note after that, wherever it had been added, assumed that Teresa Duarte began the process already dead. Another note seemed to be a list of talking points for breaking the news to the high consul.

With your life span, she was going to die before you did anyway.

The important thing is that we learn as much as we can from her ~~death~~ sacrifice.

Children die in nature all the time. This is just like that.

But the one she kept returning to was *Holden's argument correct?*

"She was . . . is heir to the empire," Elvi said. "If Cortázar turned her into a lab rat, it might destabilize Laconia. Take away the clear line of succession?"

"That's an awfully long game," Fayez said, pulling on his shoes. "It explains how Holden knew. But then why did he warn us?"

"Couldn't go through with it?" Elvi said. "Holden's a decent person. Decent people have trouble with murdering children. Second thoughts. Doubts. I don't know. I don't understand anything anymore."

"That's the thing about alien biologies and transdimensional monsters," Fayez sighed. "At least they're not *supposed* to make sense."

Elvi sighed in agreement and looked at herself in the mirror. Her leg was healed in that it didn't hurt, but the gouge the aliens had left in it still showed. A lighter patch of skin with a puckered edge.

"Pass me the cane?" Fayez asked. And then, as she did, "Are you going to tell Trejo about it?"

"I don't know. I'm not going to keep it from him, but . . . Cortázar's dead and Holden's under guard. There's nothing for Trejo to do about it, and he's juggling enough already. How do I look? Do I look like a wrapped candy? I feel like I'm dressed up as caramel chocolate."

"You look beautiful," Fayez said, rising to his feet. "You always do. Also, that you care at all what any of these people think is charming beyond words."

"What makes you think I care about what they think?" she said. "I asked *you*."

He laughed and stepped close to her. She put her arms around his chest, leaned her head against his shoulder, closed her eyes.

"I hate this," she whispered. "I hate all of this so much. I'm so tired of being scared and overwhelmed."

"I know. I'm a little adrenaline-sick myself. Maybe we should leave."

She chuckled. "Tender my resignation? Say I'm exploring options elsewhere? Maybe go back to teaching."

"I'm serious," Fayez said. "You still have command codes for the *Falcon*, don't you?"

She pulled back to look him in the eyes. He wasn't joking. She knew all his smiles, and this was a serious one.

"There are two separate navies out there ready to shoot us down," she said.

"Maybe. Or maybe we could defect. Or just run and take our chances. It couldn't be worse. This place is made out of palace intrigue and fear as much as it is concrete. And that's before it was the target of an ongoing rebellion looking to nuke it to glass. Say you're going to look for residual transdimensional radioactive ectoplasm or something. They won't know. With the shooting war going on, they're not going to come after little old us. We could make a break for it."

It was crazy, and worse, it was tempting. Elvi imagined waking up under some other sun. In a hut on a mountain on a world without a name.

"You've wanted out since you got here," Fayez said. "You've put a brave face on it, and I have too. But this is killing you by centimeters."

"Let me think," she said. "I'll think about it."

They walked to the ballroom together. For a quinceañera, there weren't many teenagers. Even as large as the room was, Elvi felt like the air was close, stale, rebreathed. She got a glass of wine, hardly aware of who she'd gotten it from. Pulled by her exhaustion, trying to make sense of Holden, her fear of the fighting in the system, and the beautiful dream of leaving Laconia behind, she was in a fog.

"Is everything all right?"

Teresa Duarte was at her side. Elvi had been aware the girl was speaking, but she hadn't listened. "Fine. Everything's fine."

Teresa smirked. "Well. Except."

"Yes. Except."

The dinner chime came, and Elvi tried to move away, but Teresa stayed at her side. The girl was working herself up to something. With a forced

casualness, Teresa said, “I was wondering, Dr. Okoye. The *Falcon*.”

Elvi felt a chill of fear. “What about it?”

“I wondered how the repairs were going. With everything that’s going on . . .” The girl put on a smile that was meant to be calming. Innocuous. “I mean, it is built for sustained high burn. It has breathable liquid crash couches.”

“Those are unpleasant,” Fayeze said, trying to move the subject away.

Teresa would not be turned aside. “But still. If the fighting got close? You’d be able to use it to get away?”

Elvi glanced at Fayeze. His expression went blank. So he was wondering it too. They’d been in their private rooms, but that didn’t mean they couldn’t be monitored. Was Trejo watching them? Was this a test?

“Unfortunately,” Elvi said, choosing her words carefully, “the *Falcon* was deeply, deeply compromised.”

Fayeze followed suit. “I got a new foot, toenails and all, but that ship’s still in pieces.”

Teresa’s expression shifted, but Elvi wasn’t sure what it had shifted into. Elvi kept going, saying the things someone who had never thought of fleeing would say. “I really don’t think it’ll come to evacuation. None of those ships are even going to get close to the planet. And everything Admiral Trejo has at his disposal will be used to keep us all safe.”

“Maybe you should put a push on the repairs, then,” Teresa said, harshly. *As if there is anything I would rather do*, Elvi thought, and chuckled.

“Maybe I should,” she said as they entered the dining hall. Teresa finally had to go her own way. It felt like escaping something. Fayeze put his arm around her waist and let himself be guided to their table.

“That was uncomfortable,” he said.

“Don’t read too much into it,” Elvi said as they found their chairs. “Also? Don’t forget it.”

The dinner proceeded, the conversations stayed on safe ground. Elvi put Holden and his role in Cortázar’s murder plot out of her mind. She didn’t think of it again for weeks, and by then things were already out of control.

“Holden escaped,” Ilich shouted. The speaker on her hand terminal overloaded a little, flattening his voice. She tried to bring herself back to consciousness. It was hard to believe she’d actually drifted off, but the dreams still had their claws in her.

“The attack,” she said.

“They’re here. They’re fighting right now, and Holden’s free.”

She sat up on her bed. She was still wearing her uniform, though it was creased from sleep. She rubbed the back of her neck with an open palm. Holden was out of his cell at the same moment that the underground’s strike force was engaging with the defense grid. There was no way that could be coincidence. Somehow, he’d known it was coming. And he was getting out before the bombs hit the State Building.

Her gut clenched. The fear that had been growing since the enemy’s gambit became clear tightened her gut. *I’m going to die. Fayez is going to die. We’re not going to see dawn.*

“Tell Trejo,” she said. “You need to tell Trejo.”

“He’s busy commanding the defenses. Holden stunned the guards. They’re still unconscious.”

“Jesus Christ,” she said. “What do you want me to do about it?”

Ilich stammered for a few seconds. “I don’t know what to do.”

“Secure the pocket nuke that’s in the same facility, then get a security team and start looking for him,” Elvi said.

“Yes,” Ilich said. “Right.”

He dropped the connection. Fayez was sitting on the edge of the bed, his eyes wide and alarmed.

“That man,” Elvi said, “is not great in a crisis. I’m starting to think he’s got the wrong job.”

“Elvi,” Fayez said. “Holden. *Teresa*.”

It only took a moment. “Shit.”

She went for the door, Fayez close behind her. The air was cold and wet and stinging. It numbed her face instantly. Flakes of snow swirled down

from the sky like ashes from a huge fire. The distant ground-based rail guns made a constant rolling thunder, and the clouds flickered red and orange in the north as they fired. Far above the clouds, a battle was going on. Elvi put her head down and ran. Fayeze came along just behind her, his footsteps falling in and out of sync with her own.

An alarm sounded, screaming out across the State Building and its compound. She didn't know if it was about the war or the escaped prisoner.

At Teresa's rooms, she pounded the door with her fist and shouted the girl's name, but the only answer was frantic barking. The thunder of the planetary defenses grew louder, almost deafening. Something terribly bright happened somewhere above the clouds and turned the white snow-struck landscape to noon for three long seconds.

"We need to take shelter," Fayeze said, and Elvi kicked Teresa's door. Fayeze did too. It seemed like it wouldn't be enough. They'd beat themselves against it forever and never get through. And then the frame gave way, the door slammed inward, and Teresa's dog ran out into the night, barking madly.

"Get inside," Fayeze shouted, but Elvi was already following the dog. It bounded through the fallen snow, throwing up ice like dust. Its bark was urgent, and it led Elvi on. She couldn't feel her feet well, and her wounded leg burned and ached, but one foot went in front of the other.

Snowfall and the battle light had changed the gardens into a vision of hell. She didn't know where she was, didn't know where the State Building was, couldn't tell where she was going, except that she was following the trail of paw prints and broken snow.

She should have gotten a gun. She was a major. Someone would have given her one if she'd asked. Better, she should have called Ilich and the security team. It was too late, though. She couldn't turn back, and she had to believe that the James Holden she knew would listen to her. Would hear her. Would stop whatever his plan was before the girl got hurt.

The dog vanished into the gloom ahead, barking and howling. She'd been stupid. She'd been overworked. Duarte and Cortázar and the war and the things from beyond time and space. They'd overwhelmed her and she'd

lost sight of the girl who was right in front of her and the man who'd planned to kill her.

All the panic and the fear and the driving need to flee distilled into this moment, this doomed rush, the snow, and the howls of the dog.

And voices.

"Stop!" Elvi shouted, and her voice was hoarse. "Holden, stop!"

The trail led almost to the fence. High in the darkness, the mountain beyond the State Building reared up, transformed by snow and darkness into a vast gray wave. And there, in a snow-filled gully, James Holden stood in a black guard's uniform. His hair was wild and his skin was pale except for two bright-red patches at the cheeks where the cold had bitten him.

The dog capered and yapped at his side, and Holden raised a hand like he was seeing an unexpected friend at a cocktail party. But there was another voice. Teresa's voice, scolding the dog and telling it to be quiet.

"Holden," Elvi gasped. Now that she was slowing down, her side hurt like someone was stabbing her. "Holden, stop. Don't do this. You don't have to do this."

"Do what?" he said. And then, "Are you okay?"

"Let her go. It won't fix anything to hurt her."

Holden's forehead furrowed, and for a moment, she could see the young man he'd been the first time she'd met him, decades ago on a different planet. She held tight to the chance he might still be the same man, somewhere deep inside.

"Hurt who?" he said, and pointed at Teresa. "Her?"

"I know what you did," she said, trying to catch her breath. "I know you put Cortázar up to it."

"We have to go," Teresa said. Elvi noticed for the first time that the girl was doing something in the gully. Digging away a drift of fallen snow. Holden's sleeves were crusted with ice where he'd been doing the same.

"She's just a kid, Holden. Whatever your plan is, she doesn't have to be part of it."

"I'm more part of *her* plan at this point," he said.

“We have to go!” Teresa said. “We don’t have time for this. Muskrat! Shut up!”

The dog wagged, happily ignoring the order. Footsteps came from behind Elvi. Fayez, stumbling through the snow. A deep, rolling sound came from the north. The earth trembled, and the rail-gun flashes stopped. Without their voices, the night seemed weirdly silent.

“What’s going on?” Fayez said.

“I’m leaving,” Teresa said. “I’m trading their prisoner for a way out, and I’m leaving. His ship is coming for us right now, and we have to get to the rendezvous.”

“He tried to get you killed,” Elvi said. “You can’t trust him.”

“I can’t trust anyone,” Teresa said, and the weariness and bitterness in her voice belonged to a much older woman.

“No,” Holden said. “That wasn’t about Teresa. That was about you. Hey, Fayez.”

“Hey, Holden,” Fayez said, and dropped to his knees at Elvi’s side. Snowflakes landed on his hair and stayed there, unmelting.

“I don’t understand.”

“This has all been about you,” Holden said. “Literally from the minute I found out about the alien rip-in-space thing that showed up on the *Tempest*, I’ve been trying to get Cortázar out and you in his place. All this?” He gestured at the now-quiet sky. “I don’t know anything about it. I haven’t been in touch with anybody. None of it’s been me.”

Elvi shook her head. “I don’t understand.”

“I got you the job,” Holden said. “I’m the one who told Duarte you’d been studying what killed the protomolecule engineers. And yes, I talked Cortázar into getting himself in trouble. And then I tried to rat him out. It was the only thing I could think of that Duarte would care about enough to get rid of his pet mad scientist. And since you were the expert, you’d get the promotion.”

The punch in her chest was betrayal. She felt betrayed. She’d seen Sagale and Travon die because of Holden. She’d almost lost her leg, almost

lost her husband, suffered through everything because of him. “Why would you do this to me?”

“I wanted to get someone sane and rational in charge before Duarte did something stupid that we couldn’t take back.” He lifted his hands and then let them fall, a gesture of powerlessness. “I’m not sure it worked, but it was all I could do.”

Teresa stood up. Her black sweater was white with ice. “We can get through. The space is big enough. But the second I’m off the grounds, security’s going to know it. We can’t stop running once we start.”

Holden nodded, but his eyes were on Elvi. “I’m sorry,” he said.

Make up for it. We’re here. Take us with you. And in the other half of her mind, the labs. The pens. The *Falcon* and all the data she’d acquired with it, still waiting to be sifted through. Was Ochida going to take it up if she left? Would he be better than Cortázar?

Was there anyone, anywhere she’d trust with this more than she trusted herself? And the enemy—the deep enemy—had tried to hurt them already. Was looking for a way. Her leg throbbed like it was reminding her of the black things between the spaces. Was someone else going to stop them?

She looked at Holden’s face. He was one of those men who was going to look boyish until the day he died. *Fuck you for putting me in this position*, she thought. *Fuck you for making this the right thing for me to do.*

It wasn’t what she said aloud.

“Go.”

Chapter Forty-Seven: Naomi

Alex?”

“I see it,” he shouted. “What do we do?”

A wave of disorientation washed through her, like she had started floating again without having stopped the first time. The ship jumped and shuddered around her as she pulled up the record of Amos’ mission and cross-checked. It looked real. If it was false, it was convincing.

The plan was to hit the platforms and then burn hard to get away before the enemy forces could get back. She’d given them a wide window for it. Adding in a surface landing and extraction . . .

But if she didn’t, and Amos really was waiting. Or Jim.

“Naomi?” Alex asked again. “What do we do?”

“Take out the platforms,” she said. And then, “First. We take out the platforms first.”

“If we’re going to land, we have to slow down,” Alex said.

She needed time. She didn’t have it. The *Roci* shifted hard, then fell away, slamming her against her straps as their rail gun fired.

“Get me options,” she said.

“Coming up,” Alex said, and the thrust alert came on. They were flying into the enemy barrage, and she was slowing them down. “Ian! Tell the others to match my course. We’re putting on the brakes.”

She pulled up the tactical, and the drive came on, pushing her back into her couch and the coolness of the gel. She couldn’t tell if it was the evasive dodging or the changes in acceleration or her own sense of doom that left her feeling nauseated, but it didn’t matter. She pulled up the tactical display,

ran it through the *Roci*'s system, and prayed to nothing in particular that a solution existed.

Their information on the defense grid was pieced together from Transport Union ships that had moved through the system. Five weapon platforms, flat black and resistant to radar. They were in higher orbits than the alien construction platforms, and spaced around the planet in a web that put any approaching ship in the sights of at least two and usually three. They were already firing at Naomi's little strike force, and whatever technology they were using to compensate for the rounds they fired, it didn't make a heat or light plume that she could use for targeting.

The construction platforms were closer to the planet, long and articulated, with filaments coming off of them like something in a microscope slide of contaminated water. They shimmered with light. There were five of those too, all of them in near-equatorial orbit.

The plan had been to approach with the ships close together so that they would all be covered by the same defenses and dilute the incoming fire between them. Then, when they were close, the *Cassius* and the *Prince of the Face* would split off, wrapping around the spinward side of the planet while the *Roci* and the *Quinn* cleaned up anti-spinward. Then they would all burn hard for the ring gate and the hundreds of systems beyond to hide in.

That had been the plan. Now it was the same, but slower. More time in the enemy crosshairs. Less chance of escaping unharmed.

Ian shouted over the din of PDC fire, drive resonance, and thruster burn. "*Cassius* is requesting permission to break off. They're ready to make their run."

"Confirmed," Naomi shouted. "Let's do this."

"With them gone, the bad guys are going to have more guns for us," Alex said. "We're about to get real bumpy."

"What the hell has it been up to now?" Ian asked.

"Walk in the park, kid," Alex said.

On her tactical display, the *Cassius* turned, its drive plume leaning in toward the other three as it slid toward the far side of the onrushing planet.

A few seconds later, the *Prince of the Face* did likewise. As they slid away, a new bloom of fast movers jumped up from the Laconian defenses.

“How many of these missiles can we take?” Naomi shouted, and a voice she didn’t know yelled back, *PDCs at sixty percent* as if that answered her question.

“We can start doing damage of our own in eighty seconds,” Alex said. “Seventy-nine.”

“Lock on the construction platforms,” Naomi said. Her legs felt like they were on the verge of cramping. Her monitor was throwing three low-priority medical alerts. She ignored them. The ship moved hard to port, fighting to get out of a rail gun’s firing arc. They were getting close enough that dodging after the rail gun fired was getting hard.

“Permission to hit their weapons, Captain?”

“No,” Naomi said. “The construction platform goes down first.” She might die. They all might die. Even if they did, they didn’t have to lose.

She fought the temptation to grab weapons control herself. The fear and the tension left her muscles trembling, and the evasive shifting was coming faster and harder. She wanted a sense of control. Of being able to bend the next minutes to her will. Trusting a crew she’d barely met with everything was like flying blind.

“*Prince of the Face* reporting that the *Cassius* took a rail-gun hit,” Ian shouted.

“How bad?” Naomi asked, already pulling up the sensor array data to see for herself. By the time Ian spoke, she knew.

“The *Cassius* is gone.”

The odds shifted in her mind again. If the *Prince of the Face* was lost too, it would mean looping around Laconia to catch the surviving platforms. She’d only just taken on the risk by slowing down, and she was already paying the price.

She took comms control and opened a connection to the *Prince of the Face*. As soon as it went through, she started talking.

“This is Naomi Nagata of the *Rocinante*. Kill your braking burn. Go back to the initial strategy. In fast, kill the construction platforms, and burn

for the gate. Do not decelerate further. Do not wait for us.”

“Reconegut, *Rocinante*,” a voice came back. The accent was pure Ceres Station. “Geh cahn Allah, sa sa?”

On her tactical display, the *Prince of the Face*’s drive plume died, and the ship seemed to leap ahead, rushing toward its target by burning less.

“We’re almost in range,” Alex said.

“I don’t care how much you have to dance,” Naomi said. “Just get us there.”

“Ten more fast movers coming from the defense platform,” Ian said. “PDCs are at fifty.”

“Alex?”

“Doing what I can,” he said. “Give me thirty more seconds.”

Naomi opened a channel to the *Quinn*. “Report.”

“We took a few rounds in engineering and our machine shop,” a young man’s voice answered. “We’re okay for now.”

“*Rocinante* is lining up a shot. Cover us.”

“Copy that,” the *Quinn* said.

The *Roci* slammed to port, and then again. Naomi’s crash couch whirled, keeping the impacts against her back no matter what direction they came from.

“I really. Wish. They had fewer rail guns,” Alex said from between clenched teeth.

“At least we can dodge,” Naomi said.

“We can until we can’t,” Alex said, and the *Roci* stuttered under her as their own rail gun fired. She pulled up the image of the alien platform, still much too far away to see with the naked eye. Even with the *Roci*’s system stabilizing the image, it jumped and vibrated. Naomi leaned in, willing the shot to hit. At this distance, even a mistiming in the shot, a small unanticipated vibration, could mean they’d failed.

The image whited out for a second as an enemy missile died close enough to their line-of-sight to confuse the sensors. It came back in time for her to see the platform shudder and shift. The complex structure seemed to pull in like it was wrapping itself around an injury. It thrashed once, a

widespread spasm. The shimmer of lights danced along its spine and out through the structures of its arms, and then it began to unspool. Like a tight-wound thread dropped into water, it relaxed and spread. The rigid shape softened and collapsed on itself, scattering through the emptiness over a vast Laconian ocean. Bright lines of energy like lightning or dying nerve impulses shot along it as it grew dark and drifted apart. The *Roci* shook and shuddered as the alien structure gently, gracefully died.

Alex let out a sigh that was part relief and part awe. Naomi knew exactly what he meant. She tried to open a connection to the *Prince of the Face*, to report the kill and check in, but the body of the planet blocked it, and there weren't any repeaters she could use. From here on in, she had to go on faith.

Alex turned off the drive. They'd braked. If they'd kept it going, the *Roci* would have started moving away from the planet again. They were in orbit now. Being on the float should have been a relief. It felt like a threat.

"Where's the next one?" Naomi asked.

"Coming up," Alex said. "It's behind the horizon line now. We'll have it in eight and half minutes."

"Let's start knocking down some of these weapons platforms. See if we can get a little peace."

The *Roci* kicked again, and the PDC chatter was joined by the deeper, subtle thrum of the torpedoes launching. Naomi found herself grinning despite the pain.

"What's that?" Naomi said. On the surface of the planet, near the center of one of the continents, a brightness was lighting the thick clouds from beneath. City lights. The capital. Laconia. And just north of it, a bright and burning light, rising up through the atmosphere in a perfectly straight line of fire and smoke.

"Huh," Alex said. "That's surface-based rail guns."

"Were we expecting those?"

"First I've heard of them."

"That's going to make landing a lot harder."

“Yes, it is,” Alex said, and dragged the *Roci* out of the path of the incoming fire. “Kind of makes you wish the pickup was a little farther from the most guarded part of the planet, really.”

“We’d meant to do this a long time ago,” Naomi said. “It looks like they built up in the meantime.”

She checked her maps. The city was almost beneath them now. This was as close to Jim as she had been in years. If the *Prince of the Face* was on time and target, there was only one platform left. On her monitor, one of the Laconian weapons platforms blew, taken out by a combination of a rail-gun round from the *Quinn* and two of the *Roci*’s remaining torpedoes.

It would be so easy to order the drop. Fall through the rough Laconian air, make the pickup, and kill the last platform on her way out.

If she was sure she’d make it. If she was so convinced that she’d live through it that she could risk wasting everything they’d done until now. And she wasn’t.

“Steady as she goes, Alex,” Naomi said.

A sudden bang like a detonation shook the ship, deafening her. She waited for the hiss of lost air, the silence of the vacuum, and it didn’t come.

“What was that?” she shouted.

“Debris hit,” Ian said. “We’ve got a hole in the outer hull.”

“Watch our pressure. If we start leaking, tell me.”

“You got it.”

“I’ve got the last one,” Alex said.

Fast movers on our back. PDCs at thirty percent. Naomi pulled up the visual tracking. They were so close now, she could see the curve of Laconia in the scopes, the milkiness of its high atmosphere.

A connection request came in. The *Prince of the Face* had cleared the planet and had line of sight for a tightbeam. She accepted it.

“Give me good news,” she said.

“Clar y muerte,” the *Prince of the Face* said. “Up to you now, boss.”

“Thank you for that,” Naomi said.

Another rail gun from the surface.

“Another what?” the *Prince of the Face* asked.

“We’re getting fire from the surface,” Naomi said. “It’s fine. Continue with your flight plan. Get out of here. Do it now.”

“Maybe etwas can can do,” the *Prince of the Face* said, but before she could ask what they meant, Alex said, “I’ve got lock.”

“Do it,” Naomi said.

The *Rocinante* bucked again. The rail-gun round left a faintly glowing trail, superheating the almost-absent air that it passed through. Naomi held her breath. The rail-gun round touched the distant platform, and her sensors went dead. She pulled up the ship status. All the sensor arrays had tripped to safe. Overloaded.

“What’s—” she started, and the ship screamed. She grabbed the edge of the crash couch as it whirled crazily. They were tumbling. A shock wave moved through the barely present gas out past the edge of turbopause, still strong enough to send them spinning like a kid’s toy that had been kicked. The lights flickered, died, and came back on again. The bones of the ship creaked, and the roar of maneuvering thrusters filled her ears as Alex fought to bring them back to stability. The sensor arrays were still resetting, and Naomi felt the rail-gun rounds cracking up from the surface unseen. She waited to hear them snap through her ship. Hole the reactor. End them.

When the sensor arrays blinked back, the construction platform was gone. A corona of superheated air danced where it had been, green and gold and red.

“I think they may have been making some more antimatter,” Alex said, dryly. “Not sure that was the best idea.”

Naomi didn’t respond. Something was happening on the surface of the planet. The ground defenses where the rail-gun rounds had originated was reading hot. Nothing was firing. She tried to connect the death of the platform with it, but the pieces wouldn’t fit. Something else had happened.

A connection request came. The *Prince of the Face* again. Naomi took it. “Did you do something? What did you do?”

“Still had demi-hold á plasma torpedoes, yeah?” the other ship said. “No use for. Dropped them on your rail-gun base, que? Clear your way. Question is what did *you* do? That a *nuke*?”

“Nothing so trivial as that,” Naomi said. “Thank you, *Prince*. We’re good. Now get out.”

“Already gone,” the ship said, and the connection dropped. She sent a tightbeam to the *Quinn*. It answered immediately.

“We’re seeing all enemy weapons platforms in the hemisphere disabled,” a young man said. “We have a half-hour window before anything cycles to this side of the planet.”

“Go,” Naomi said. “We have a pickup to make on the surface.”

They were silent long enough Naomi thought she might have lost the connection.

“We’re your escort, *Rocinante*. Do what you need to do, we’ll be here. If we were rated for atmo, we’d go with you.”

“Negative, *Quinn*,” Naomi said. “Burn for the gates. That’s an order.”

A moment later, the *Quinn*’s drive plume bloomed out bright and huge, and the *Rocinante* was left alone in the wide sky over Laconia. Naomi looked around her. There was smoke in the air, but no alarms were going off. Her crash couch had pushed one of her medical alarms back to normal, but the other two showed elevated cortisol and blood pressure. No one was shooting at her, and it felt strange.

“Alex?” she said. “Are we ready to go down?”

“Checking,” he said. “That debris hit fucked up our aerodynamics, but . . . I can make it work. It’ll be choppy as hell.”

“Can’t scare me,” Naomi said. “Get us down. As soon as you can.”

Below them, Laconia was in night. There was a beauty to it. Apart from a faint bioluminescence where the distant sea met the shore, the land was dark. The only light was shrouded by clouds. This was what Earth would have looked like, more or less, before the first electric light. Before the first satellite, the first orbital shuttle. Before Mars. Before Ceres. Before the Belt. It was the heart of a galactic empire, and still as bare as wilderness. Auberon and Bara Gaon had more cities. Earth had more history. Every place had the dream of what it could become.

Dreams were fragile things to build with. Titanium and ceramic lasted longer.

“Captain?”

She looked over at Ian. He was a boy. He was probably older than she’d been when the *Canterbury* died and she’d first set foot on the *Rocinante*, and he was just a boy.

“Kefilwe,” she said.

“I was wondering if I could take the comms controls back,” he said. “I . . . It’s my duty. If you . . .”

“Sorry,” Naomi said, shifting them back to his station. “Old habit. That was rude.”

“Just trying to feel useful,” he said through a tentative smile.

“All right,” Alex said. “We’re as close as we’re going to get. And more time won’t help us.”

“Take us down,” Naomi said. The maneuvering thrusters fired, slowing the ship and letting it drop. Alex turned them back toward the cloud-blanketed city already carried hundreds of clicks away by the planet’s rotation, tilted down the nose, and tapped his controls. The maneuvering thrusters roared again.

Less than a minute later, the *Rocinante* hit air.

Chapter Forty-Eight: Teresa

Teresa pushed through the cold and the darkness of the flood channel, hunched down. A slush of almost frozen water and slime soaked her shoes and the hem of her pants. Clearing the entrance had numbed her hands, and now her fingers were starting to hurt. Not bringing gloves when she left only felt like the most recent in a long line of terrible choices.

Behind her, Muskrat whined.

"I told you to go back," Teresa said, but the dog ignored her. If anything she stayed closer. And behind Muskrat, the heavy footsteps and rough breath of James Holden.

The slush under her feet grew thicker, more solid. A few more steps, and she was standing on solid ice.

"We're almost there," she said. "There?"

"The other side of the flood channel."

"Is that the pickup?"

"No, we have to get to the mountain."

"Mountain. Right," Holden said. "Okay."

A thin oval of gray the size of her pillow swam out of the darkness ahead. A drift of fallen snow blocked the way out, but not enough to stop her. Teresa stamped forward, pressing the snow down, compacting it, then scrambling forward to do it again. Somewhere in the State Building, an alarm was going off. The security forces alerted to her escape. She hoped that the battle would be distraction enough to lend her time.

"You're going to get soaked," Holden said.

"I'm going to get *out*."

He was quiet after that.

She scrambled out into the world. The wall of the State Building was behind her, the stretch of the wilds ahead. Holden emerged more slowly, and Muskrat with him. The trees had pulled in all their leaves, and the snow stuck to their trunks like a million featureless masks. Everything was transformed. The same and not the same. For the first time, she felt a prick of uncertainty. This was her place. She knew it and how to navigate it. Or at least she had until now.

She headed down the first path. Her breath plumed white and thick with every exhalation, and moving helped to keep the cold at bay. She wished that the flashes and roar of battle were still there, if just to help light the way. She told herself that it meant the rescue ship was almost there. And that she had to hurry.

The path through the forest seemed brighter than the sky above them. The snow was thicker here, rising up almost to her knees. Muskrat huffed and pushed, forging a path beside hers, and Holden followed along in the furrows they made. The snow was still falling. Small, hard flakes that tapped against her cheeks and melted down like tears.

There were tracks in the snow where animals had passed, and one of the trees had a long, fresh rip in its bark where something looking for food had dug deep into the hibernating flesh. Teresa wondered if animals did that on other planets, or if it was only here. For a moment, the implications of what she was doing rose up and threatened to overwhelm her, but she pushed the thoughts aside. She wasn't going back now. Not even if she could.

Something moved in the trees to her left, and she felt a moment of panic. A bone-elk leaped across the path and away, the exoskeleton of its legs clattering like stones rolling down a hill. It was nothing.

She made what she thought was the right turn, and the path grew steeper. The mountain loomed up in the darkness. Not really a mountain. An artifact so ancient it was covered in stone. Or one that had been made that way. History so deep, a forest had grown over it, and seasons passed against it like days.

She pushed into the clearing where the evacuation ship was supposed to land. It was wide and flat, with a slope that rose toward the distant summit

on one side and a clear view of the State Building on the other. In the falling snow, the buildings with their softly glowing windows seemed farther away than they were. Like something seen from fairyland. With the flash and roar of the battle gone, it looked peaceful. It wasn't, but it looked that way.

Behind her, Holden came to the clearing. He had pulled his arms inside the shirt for warmth, the sleeves flapping empty against his sides. He squatted down in the snow.

"Are you all right?"

"Out of shape," he said. "Next time, I'm working out more. I'll convert a corner of my cell into a gym or something."

She'd had enough conversations with him now to know he was telling a joke without his voice signaling that it was a joke. No one else in her social life did that, and she found it irrationally annoying. It made every exchange into a puzzle that had to be decoded to see if it was sincere or not. She pushed the irritation away. There were a lot of things people did that she'd never had to be patient about. It was time to start learning that skill.

"This is where I met him," she said.

"Met him?"

"Timothy," she said. "Amos."

"Oh," Holden said, and looked around. For a moment, he was silent. "It's beautiful. I mean, weird. But also beautiful. I wish I'd seen more of Laconia. Not just the gardens."

"Me too," Teresa said, and stared at the low, gray sky. "Where *are* they?"

Without the trees to shelter them from the wind and the effort of pushing through the snow, the cold grew sharper. Holden seemed to fall in on himself, arms wrapped tight, head resting on his knees. Muskrat went and sat beside him, the dog's wide brown eyes concerned.

Teresa knew about hypothermia. She didn't feel bad herself, but Holden was older and he'd been in prison for a long time. It had weakened him. She thought about going and sitting beside him too. She remembered stories about people caught in the wilderness making structures in the snow to capture and share body heat, but she didn't know how that worked. She

wondered, if the evac ship came and Holden was already dead, what they would do with her . . .

A blast of frigid air came down the mountain, pulling the top layers of snow up in brief whirlwinds. Teresa took a step toward Holden. Maybe she could take him to Timothy's cave. Just until the ship came. Take him there, and then she could come back herself and lead the rescuers to him. If there were rescuers. If this worked.

A trickle of black dread seeped through her body. This had to work.

"I'm sorry you had to find out that way," Holden said.

Teresa looked at him. She couldn't remember if delirium was part of hypothermia, but it seemed like it might be. "Find out about what?"

"The whole killing-you thing. Pushing Cortázar into it. It wasn't personal."

Teresa looked him. A miserable man, hunched in the snow. She knew that she should feel angry. She was angry all the time these days, and at everyone. She tried to summon up the rage, but it didn't come. She could only feel sorry for him.

Holden took her silence as something it wasn't. He kept talking. "It wasn't supposed to get you hurt. I was putting a wedge between your father and Cortázar. That was all. You were the only thing that would do that. Everyone saw how much he loved you."

"Did they?"

Holden's nod was slow to start, like he was already turning into ice. "There was a woman I knew. Long time. She used to say you can't judge anyone by what they say. You have to watch what they do."

"She *said* that."

"I recognize the irony. But I watched what she did too. How she made people like her. How she made them afraid. I'm not good at the second one, but I was pretty good at the first part."

"Because of her?"

"In part. And I watched what your father did with you. How he treated you. And I used that. I'm sorry."

"Yeah?"

“Not repentant,” he said. “Just sorry.”

“So sorry that you’d do it again the same way?”

“I’d try to move it along a little faster, but yes. Sorry that it was my best move.”

Teresa looked up into the clouds again. The snow swirled down at them. Her fingers and toes were starting to burn. There still wasn’t a ship.

“It’s okay,” she said. “I knew you were the enemy. You did what enemies do. It’s worse when it’s your friends.”

“That’s true,” Holden said. And then, “Cart’s coming.”

She listened and heard it too. The electric whine of a security cart. The way the snow muffled sound, it had to be close. She looked around for someplace to hide, some way to escape, but the snow would give her away no matter where she went, and Holden couldn’t run anymore.

“Stay calm,” she said. “I’ll handle it.”

A moment later, Holden rose to his feet, and Muskrat looked up at him, concerned. The dog’s expression said, *Maybe you should sit back down. You don’t look steady.* Holden scratched between her ears.

There were voices now. She made out two of them. Maybe a third. Down the path that led back to the State Building, a light began to dance. Headlights on a cart moving fast through the fallen snow. Voices calling her name. The cart rolled into the clearing and stopped. Three men in it. Two wore guard uniforms like the one Holden had stolen. The third was Colonel Ilich.

Ilich leaped out, pistol raised at Holden.

“Put your hands up,” Ilich shouted. “Now!”

“Okay,” Holden said, poking his arms back into his sleeves, then lifting them. “I’m not armed.”

“Teresa, get in the cart.”

“No, you get in the cart,” Teresa said. “I’m not going anywhere with you.”

Ilich turned toward her, shock in his eyes. She watched him understand, confusion slipping seamlessly into rage.

“Get in the fucking cart,” Ilich said.

“Or you’ll shoot me?”

The two guards looked at each other nervously, but Ilich walked toward her. He kept his pistol trained on Holden, but his eyes were on her.

“No, I won’t shoot you. But I’ll put a guard on you every moment for the rest of your life.”

“You don’t control me anymore,” Teresa shouted, and Ilich laughed.

“Of course I do. That is literally my first duty. Make sure the girl eats. Make sure the girl sleeps. Educate her. Socialize her. I am your fucking mother, and I am telling you to get your spoiled, egotistical, self-centered ass into that God damn cart!”

“I won’t,” she said, and crossed her arms.

Ilich seemed to deflate. For a second, she thought she’d won.

“You will,” he said, “or I’ll kill your dog.”

He lowered his pistol a degree. It was like the volume of the world turned down. Teresa could still hear everything, but at a distance. She waited for the gunshot, sure it was coming. That she wouldn’t be able to stop it. *Don’t do it, I’ll come* tried to find its way to her throat, but she was frozen. Her throat wouldn’t work any better than her legs. Ilich shook his head once, just a centimeter one way and then the other. He turned to check his sights on Muskrat, but the shot that rang out wasn’t from him.

Back at the cart, something was happening. Teresa couldn’t tell what it was at first. Her mind tried to make it into the two guards wrestling with each other, except one of them toppled out the side of the cart and fell into the snow. The violence in the cart kept going on. In her peripheral vision, she saw Holden step in front of Muskrat, his arms still lifted, but Ilich wasn’t paying attention to that now.

“Captain Erder! Report!” Ilich barked, but no one answered. Instead, the guard still in the cart shrieked once. Something wet snapped, and the screaming stopped. Everything was perfectly still. Ilich took a step toward the cart, then another.

Timothy boiled out from the shadows behind the cart, sprinting through the snow. His eyes were black, his skin gray. Ilich fired and a smear of blackness appeared on Timothy’s bare ribs. He hit Ilich like he’d fallen

from a great height and sent the man's legs up in the air as Timothy bore his torso down into the snow.

It had all happened too fast. She didn't know if the pistol belonged to one of the guards or if he'd taken it from Ilich. Only that it looked smaller in Timothy's hand. Muskrat barked happily and wagged her tail, scattering the snow.

Holden slowly let down his arms. "Amos?"

Timothy—Amos—stood up over Ilich and went perfectly still for a moment, then said, "Hey, Cap. You look like shit." Below him, Ilich gasped, the wind knocked out of him by the violence of Timothy's charge.

"You've been prettier yourself, one time and another."

"Well, you know how it is." Amos turned his dark eyes to her and nodded down at the snow where Ilich lay, still wheezing. "Hey there, Tiny. This guy a friend of yours?"

Teresa started to say yes, and then no, and then she understood what he was asking.

"No," she said. "He's not on my side."

"All right," Amos said, and fired the pistol twice. The muzzle flash was the brightest thing in the world.

"How did you find us?" Holden asked, swaying on his feet.

"This asshole," Amos said. "I been tracking him every time he came out from the compound over there. Figured sooner or later, I'd get a shot at him. You made a good distraction."

"Did you have to kill him?" Holden asked.

"Just evening up the score, is all. Are you sure you're okay, Cap? You seem kind of fucked."

A dozen questions pressed at Teresa's mind—where have you been living, how did you survive without any of your things, how badly are you hurt, why aren't you dead—but what came out of her mouth was, "Aren't you cold?"

Amos looked at her, thought about the question. Snowflakes were landing on his bare chest and melting there. The hole in his ribs where he'd been shot wasn't bleeding. After a moment, he shrugged. "I'll live."

Before Teresa could say anything more, a powerful, deep roar came from somewhere high above them. Her first thought was that they'd started an avalanche. She imagined herself and all the others wiped away by tons of snow rushing down the mountain. But then she saw the lights in the sky.

Amos took her elbow, leaned close, and shouted in her ear, "We should get back to the tree line."

She let herself be led, Holden and Muskrat following close behind, as a huge ship fell from the sky. The plumes of its maneuvering thrusters melted the snow in the clearing away in an instant and set the security cart rolling. Teresa huddled back among the dormant trees, her hands over her ears, until the roaring stopped and Amos tapped her shoulder.

The ship was a fast-attack frigate. A very old Martian design. Its sides were a patchwork of different plating materials. Steam rose all around it, and the cooling metal and carbon-silicate lace ticked and popped. Teresa walked out toward it with a sense of awe and joy and profound accomplishment. She'd done it.

The airlock opened, and a man in no kind of uniform looked down into the darkness and the mist and the snowfall.

"Who's there?" the man's voice called.

"Alex?" Holden shouted.

Almost conversationally, the voice said, "Well, holy shit."

A rickety metal stair ladder descended. Holden went up first, his steps unsteady at first, but more sure the higher he went. Muskrat paced at the bottom of the stair anxiously.

"I don't know," Teresa said to her. "This is why I told you to stay in my rooms."

"Go on up," Amos said. "I got this."

Teresa put her hands on the bright metal and climbed up toward the hands of strangers reaching out to help her aboard. And behind her Amos, balancing without his hands because his arms were filled with dog. The black wound on his side didn't appear to bother him. The man waiting for them laughed when he saw Muskrat, and the dog wagged uncertainly at first.

The locker room seemed to be on its side, Holden and a bald, dark-skinned man embracing and grinning at each other. Timothy—no, Amos hauled up the ladder, and the airlock door closed behind her.

She'd practiced for this moment. *I'm Teresa Duarte, and I'm giving you back this prisoner in exchange for passage out of Laconia.* Now that it had arrived, it seemed like that was all just given.

"You got to come up to the flight deck," the dark-skinned man said. Alex, Holden had called him. "We gotta get out of here, but I'm not letting either of you two sons of bitches out of my sight."

Teresa followed them, unsure what else to do. Amos walked with her through the sideways lift and flight deck. A beautiful older woman with curly white hair pulled down almost over her eyes was waiting there. When she saw Holden, she took a long, shuddering breath. The prisoner took her hand.

"All right," Alex said. "Everybody strap in. We're off this mudball."

A rough cheer rose all around her, and Teresa surprised herself by joining in. Amos took her by the shoulder and led her to an ancient-looking, thoroughly disreputable crash couch.

"You're gonna need to strap in, Tiny. I got an idea what to do with this one," he said, pointing a thick thumb at Muskrat. "So you just stay here with Naomi and the captain."

"Naomi," Teresa said. "That's Naomi Nagata?"

"And this is the *Rocinante*," Amos said. "And I don't know who most of the rest of these people are, but one way or another, we're home."

And then he was gone, leading Muskrat into the belly of the ship and leaving her to stare up into the monitor. It felt strange, like she was in a dream, but also mundane as walking down a slightly unfamiliar hallway. She was here. She was leaving.

The ship shuddered, hissed, started to rise up.

"You want me to kick on the main drive?" Alex asked over the sound of the thrusters burning. "I could slag that whole palace if you want."

"No," Holden said, "leave it be. We still have friends there. Elvi, for one."

“Oh,” Alex said. “Should we go get her?”

“No,” Holden said. “She’s where she needs to be.”

The *Rocinante* rose, pushing Teresa back into the cool, blue gel of the couch. The ship shuddered and hummed as it rose, and then when they were high enough from the ground, a new, deeper thrum began, and they leaped upward. Into the darkness of space. Leaving everything behind. She closed her eyes, trying to decide what she felt. If she felt anything, or maybe everything all at once.

Her home, everything she’d ever known, was falling away behind her, and all she was certain of was that she never wanted to go back. The princess was getting hell and gone from fairyland.

A sharp alert caught her attention at the same moment the pilot—Alex—said something obscene. She looked over at him, and his face was ashen.

“Alex?” the woman said.

“We been target locked,” Alex said. “We took too long. It’s the *Whirlwind*.”

Chapter Forty-Nine: Naomi

Because the *Rocinante* was built to land on its belly, Holden stepped onto the flight-deck wall. He looked thin. More than thin, he looked like he'd been ill for months. The lines around his mouth were deeper than they'd been, and his grin looked less like his usual easy joy and more like surprise that anything good had actually happened. He looked bruised at heart, but only that. Not broken. He didn't look broken.

He met her eyes, and something in her chest that she didn't know could relax relaxed. She took a long, shuddering breath. Jim took her hand. She'd thought that would never happen again, and here he was, touching her again.

"Hey," he said, too softly for anyone to hear but her.

"Hey," she said back.

Amos, behind him, looked wrong. His skin was gray and his eyes were a uniform black. She'd seen kids on Pallas affect the same look with dyes and scleral tattooing, but on Amos it didn't look like an edgy fashion choice.

Also, he was carrying a big black dog with a gray muzzle and a perplexed expression. The girl beside him seemed familiar, but not so much that Naomi could place her. There would be time for stories later.

Alex climbed up to his crash couch, grinning. "All right. Everybody strap in. We're off this mudball."

The crew cheered, not quite drunk with success, but maybe a little tipsy. Or maybe that was just her. Holden slipped into one of the other couches, staying close to the girl. Protective of her.

Slowly the ship tilted back to its normal, upright position.

“You want me to kick on the main drive?” Alex asked. “I could slag that whole palace if you want.”

Before Naomi could answer, Holden did. “No, leave it be. We still have friends there. Elvi, for one.”

“Oh. Should we go get her?”

Holden shook his head, even though Alex wasn’t looking at him. “No. She’s where she needs to be.”

He’d been on the ship for less than fifteen minutes, and he was answering like he was the captain. If she’d pointed it out, he would have been horrified. And apologetic, and maybe in some other context she would have expected the apology. She was, after all, the head of the underground, the engineer behind the campaign and a hundred other operations besides. The pleasure of having him back, of feeling herself and Alex and the ship falling into ancient patterns, was more than she could express. It was like waking up after a long and terrible dream to find that whatever it was hadn’t actually happened.

In all her long life, it was maybe the most beautiful moment she’d ever had.

It couldn’t last.

She felt Alex flying the ship inside Laconia’s atmosphere, sliding them above the landscape and rising up above it until the drive plume wouldn’t be a danger to anyone below. When the main drive kicked on, they shot up, rising through the last of the atmosphere and into the light of the Laconian sun. As Alex laid in their course for the ring gate, Naomi checked the tactical map for her fleet. The burns they were all under were punishing. By keeping on the edge of what human endurance would allow, they made it less likely that the Laconian ships would reach them. And the enemy ships themselves . . .

She pulled up an overlay that showed the destroyers and the *Magnetar*-class battleship. It was like looking over and finding a centipede on her arm. The target-lock alert came on, cutting through the merriment and joy like a scalpel.

“Alex?”

“We been target locked. We took too long. It’s the *Whirlwind*.”

Naomi laid down a sensor feed over her tactical display. The *Magnetar* was still almost nothing without magnification. Hardly more than a pale spot of darkness in the middle of the steady star that was its drive plume. With only a little magnification, though, it was the same eerie almost-organic shape as the *Tempest*. The bone-pale vertebra of an unimaginably huge animal. A ship like that had brought two navies to their knees. A single frigate with its supplies nearly drained already didn’t stand a chance. All her joy collapsed to ashes. She wondered whether Duarte would let her see Jim when they were both in prison. Whether they’d even be allowed the option of surrender. Fighting down through the planetary defenses had taken four ships and cost one of them. Or, depending on the next few minutes, maybe two.

At least the *Whirlwind* was the last *Magnetar* that would ever be built. She’d broken the construction platforms, so at least that. If she died in the effort—if they all did—Bobbie would still have approved. Some sacrifices were worth it.

“We have a tightbeam request incoming from the *Whirlwind*,” Ian said. His voice only shook a little.

“Let’s have it,” Naomi said, and Ian looked at her. The uncertainty in his eyes was clear. He didn’t know if she was going to surrender or lead them all into death. She wasn’t perfectly certain herself. “Now, Kefilwe. This won’t get better by waiting.”

He put the incoming message on every display, though only Naomi’s was live. She didn’t know if he meant to pressure her by letting the whole crew see the exchange or if he was nervous and screwed up. It didn’t make a difference.

The woman on her screen was young, with dark skin and straight, close-cropped hair. She wore Laconian blue and the rank insignia of an admiral, the same style that Mars used to use. The rage in her eyes gave Naomi very little hope.

“I am Admiral Sandrine Gujarat, commander of the Laconian battleship *Voice of the Whirlwind*. You have thirty seconds to drop core, deactivate

your weapons systems, and open your airlock for boarding. Failure to do exactly as you are told will result in the destruction of your ship.”

Thirty seconds. Naomi raised her chin in defiance. If she was taken, they would get everything she knew eventually. The networks and contacts in dozens of systems. The long-term plans and strategies. Everything she’d built in all the time she’d spent working for Saba and then taking his place. It had made her into a perfect asset for the enemy. A ship full of her people stood breathless, waiting for her to decide whether to give them all over or let them all die. It was like being crushed under a hundred gs and weightless at the same time.

The voice that answered wasn’t hers. It wasn’t even one she knew.

“No, Admiral Gujarat. It will not end in anybody’s destruction. You will stand down at once.”

On her screen, the admiral’s eyes widened in anger, but also in confusion. Naomi craned her neck to see the girl who had spoken. She was in a crash couch, gesturing that the comms control should be transferred to her. Naomi hesitated for a moment, then went with it. When the *Roci*’s feed showed the girl’s face, the Laconian admiral paled.

“Do you know who I am, Admiral?”

“I don’t . . . The high consul—”

“Yes, I am the high consul’s daughter and heir,” the girl said. “You understand now. Good. I am on the *Rocinante* at my father’s request. Your threat is ridiculous and your orders are to return immediately to your assigned mission protecting the homeworld.”

The girl couldn’t be sixteen yet, but her voice had an easy arrogance. Naomi turned to Jim and mouthed, *Is that true?* He lifted his hands in a Belter shrug.

“Miss,” the admiral said, unconsciously bowing as she did, “you are . . . I was unaware . . . This is very irregular, miss. I’m afraid I can’t allow this ship to go anywhere.”

The girl rolled her eyes dramatically. “Is there a protocol? A security protocol?”

“I’m sorry?”

“If I am in distress, being held against my will. Threatened. Whatever. Is there a phrase I use to indicate that? Something innocuous I can slip into any conversation without my captors knowing it?”

“I . . . That is—”

“It’s a yes-or-no question, Admiral. This isn’t hard.” At this rate, the *Whirlwind* was going to nuke them to be rid of the girl.

“There is, miss,” Admiral Gujarat said.

“And have I said it?”

“You haven’t.”

“Then we can take it as given that I am not here under duress. That something is going on between the high consul and the leadership of the underground—something with which I have been entrusted and you haven’t. With that in mind? Go. Back. To. Your. Post.”

The woman on the screen squared her shoulders. “I have orders from Admiral Trejo that—”

“Stop,” the girl said. “What’s his name?”

“Whose?”

“Admiral Anton Trejo. What is his last name?”

“Trejo?”

“Yes,” the girl said, and leaned close to the camera so that her whole face filled the screen. She spoke softly and with an incandescent rage. “Mine is *Duarte*.”

“I’m sorry, miss,” the admiral said. “I can’t let your ship leave.”

“No?” the girl said. “Then shoot me the fuck down.” She dropped the connection and turned to Alex, staring down at her slack jawed. “We can go. That woman is scared to death right now.”

“Prepare for high burn?” Alex announced over the ship-wide channel, and the girl nodded curtly and settled back in her couch.

“Jim?” Naomi said.

“I know,” he said. “It’s been a really weird day.”

“We thought you were dead,” Naomi said as she stepped into the lift.

Amos blinked his unnerving black eyes, then shrugged. “Yeah, I can see that, Boss. What can I tell you? Sorry.”

Eight hours of high burn had taken them out of the *Whirlwind*’s effective range. Fifteen had increased the distance to the point that she almost felt safe. Not *safe* safe, but close enough that she could imagine stepping away from the ops deck and starting to make sense of everything that had happened, hearing everything that had brought Jim and Amos back. And how Teresa Duarte fit into it.

And also to tell them what had happened during their long and separate pilgrimages. What they had lost. With the four of them together, Alex had asked for the ceremony. As if the universe had given them a chance, and he was worried that if he didn’t take it now, it would somehow slip away. And she and Amos were heading to the airlock together again, as if the past had returned. But as if it had returned changed.

The changes to Amos were odd. His skin was somehow pale and dark at the same time, like a thin coat of white paint over black. His eyes were darkness, and there was something strange about the way he moved. But after so long, being able to think of him without grief and worry made the alterations only interesting. It was so much better than what she’d already carried with him. With losing him.

“I’d have called earlier, but . . . Well, I wasn’t ready to go. I was being patient.”

“What happened?”

He shrugged. “One thing and another. Good to be back, though.”

The lift stopped, and she stepped off. Amos followed just a step behind. “You’re different.”

“Yup,” he said, smiling amiably. It was such an unmistakably Amos-like thing to say. Such a familiar way to say it.

“Did the bomb fail?” she asked.

“Nope, it was fine.”

“So why didn’t you follow through on the mission? No blame, but . . . What was your thinking there?”

Amos went still for a moment, like he was listening to something she couldn't hear.

"I met the kid," Amos said. "Seemed kind of shitty killing her. I thought maybe it was the wrong call." He shrugged.

Naomi stepped over and put her arms around him. It was like hugging a metal strut. "Good to have you back."

Alex and Holden were at the interior door to the airlock. Alex had changed into an MCRN uniform. An artifact from another age. Jim was in a white formal shirt. He'd washed his hair and combed it back. He looked distinguished and somber.

The coffin in the airlock was just a shell, hardly more than a body bag with slightly hardened sides. And it was empty.

"This is way we always did it," Alex said now that they were together. "When we'd lost someone and couldn't recover the body. We'd still take the moment."

He cast his eyes to the deck. Jim did the same. Amos put on the same somber face he always did at moments like this. A flood of complex feelings washed through her. Sorrow and joy, relief and the emptiness of a loss that would never be made whole.

Alex cleared his throat and wiped his eyes with the back of his hand. "Bobbie Draper was one of my best friends. She was a Marine right down to her bones. Anything else she did was built on that. She was brave and honorable, and she was strong. She made a hell of a captain. I remember when Fred Johnson tried to make her into an ambassador back in the day, and she kept calling it the way she saw it instead of playing politician. She was always like that. She took on the impossible, and she made it work."

He took a deep breath, opened his mouth like he was going to go on, then closed it again and shook his head. Jim was weeping now too. And so was she. Amos' newly black eyes shifted like he was reading something in the air, and he lifted his chin.

"She was a badass," he said, then paused and nodded, satisfied.

"She will be missed," Naomi said. "From now on. And forever."

They stood in silence for a moment, and then Jim stepped forward and cycled the exterior door. When it was open, the little chemical boosters on the coffin slid it to the edge of the lock. And then it was gone. Jim cycled the lock closed again, turned, and stepped in, putting his arms around her and Alex. A moment later, the solid mass of Amos' arms looped around her too. The four of them held each other there with the hum and rumble of the *Rocinante* around them. They stayed there for a long time.

The elements of her little ragtag fleet that had been closest to the ring gate were through long before the *Roci* was even halfway through the system. Alex kept them at a punishing burn, balancing the reaction mass they still had and the distance to a friendly resupply depot in Gossner system. If they took breaks a little more often than during the dive into the system and burned a little less heavily, it was to conserve mass and because the *Whirlwind* and her cohort of destroyers were parked close in to Laconia, still knocking down the torpedoes and long-arc rocks that Naomi's people had flung at the planet. Three days into their burn toward the gate, someone somewhere had grown the balls to issue an order, and the *Whirlwind* flung half a dozen torpedoes at the retreating *Roci*. The PDCs took them all down, and no more followed.

When they were burning, Naomi used the time to calculate a safe transit schedule and tightbeam it to the other ships. From the start of the campaign to its end, they'd lost thirty-two ships, and just shy of two hundred lives. They had retrieved Jim and Amos, taken in Teresa Duarte, and destroyed the mechanism of production that Laconia depended on for its high-powered fleet. The *Whirlwind* was still a massive killing machine capable of taking control of any system it chose. But it was only one ship. It couldn't attack through any of the ring gates without leaving Laconia underprotected. It was pinned.

The *Storm* reached the gate and sent back a formal salute to Naomi before it passed through. Jillian Houston taking her ship back to Draper

Station and waiting for new orders. That was a strange thought. Naomi had spent so much of her mental energy and focus on winning the battle she'd almost forgotten about everything that came after. Freedom from Laconia didn't—couldn't—mean a return to de facto rule by the Transport Union. For one thing, Medina Station was gone and no one would be setting up a permanent base in the ring space again. For another, Laconia had replaced the structures of trade and control with its own.

But still, there were ways. There wouldn't be a choke hold on the ring space the way there had been, but there could be a network of cheap, easily replaced relays that announced incoming and outgoing traffic. Ships could know, at least, what the chances were of going dutchman before they made the transit. There weren't many people who'd choose to go through a ring gate if they knew they wouldn't come out the other side. Give the people enough information, and they'd be able to make the right decisions on their own. That was a problem for later, though. For the moment, she could watch the drive plumes of the ships that had broken Laconia touch the gate and escape, one after another, and think to herself, *Safe. Safe. Safe.*

In the breaks between the hard burns, the crew celebrated and, unfortunately, fought. In the tension before the attack, Ian Kefilwe and another young man—an engineer named Safwan Cork—had fallen into bed together and were now negotiating the difficult romantic territory of having survived. She tried to keep out of it, but once she saw Jim sitting with Ian in one of the now-empty torpedo bays, listening while the young man wept. It seemed right.

The ship was only about three hundred thousand kilometers out from the ring gates, and the remaining burns were all braking, making sure that when they did the transit, they had time on the far side to maneuver and not just slam into the other side of the sphere and vanish. The Laconian forces hadn't come after them. Not even to throw more long-range torpedoes.

Teresa Duarte was an astounding beast of a human being. Naomi tried to make a connection with her, but only once. They were in a pause, Alex making a gentle quarter g, and Naomi was getting dinner. It still felt strange

to her, seeing the galley full. In her mind, there were still only six crew on the *Roci*.

Teresa was by herself, leaning against one of the walls, a bowl of noodles in one hand and chopsticks in the other. Her hair was braided back, and it made her face look harsher than usual. No one was sitting with her. No one was speaking to her. Probably because no one knew what to say.

Naomi served herself a bowl of white kibble and sat down across from the girl. Teresa looked up, and there was a flash of outrage before she reined herself in.

“Is this okay?” Naomi asked.

“It’s your ship. You get to sit where you want.”

“Got to be a little strange, being someplace like this, yeah?”

Teresa nodded. Naomi took a bite of her kibble and wondered if they were going to sit in silence. Teresa shook her head. “There are people everywhere. And there’s nowhere to go. Back home I could be alone. No one’s ever alone out here.”

“There are ways,” Naomi said, thinking of her cargo container. “But there are usually fewer people here. It does get a little full.”

“You should have a crew of twenty-two.”

“We usually made do with six. Sometimes four.”

“I don’t like it here,” Teresa said, standing up. “I’ll want to find someplace else once we leave.”

She walked away without saying anything else. She didn’t put her uneaten bowl in the recycler, so when Naomi was finished with her own meal, she cleaned up after both of them, then walked down the corridor to her cabin.

To theirs.

Jim was in the crash couch. His jumpsuit was drenched in sweat at the armpits and down the back. He looked at her and shook his head.

“I will never, ever get this out of shape again,” he said. “This is miserable.”

“You’ll get better,” she said, and lay down beside him. The couch shifted to account for her added weight. Every time she saw him, she felt

herself not quite trusting it. Not quite letting herself believe he was really back, in case it was all a dream or a false reprieve. As if the universe would take him away from her again. It was getting better, but she wasn't sure it would ever completely go away.

"I saw your friend in the galley," she said. "She's having some trouble adjusting, I think."

"Well, she was the only child of a galactic god-emperor, and now she's eating oatmeal in a half-antique gunship. That's got to be a hard transition."

"What are we going to do with her once we get to the supply depot? You know she's too important to just let her go, right?"

"I don't know that we can make her stay. Not unless we're talking about throwing her in a prison. But there are other options."

"Are there?"

"There were plenty of Martians who didn't take off with Duarte back in the day. Some of them will be cousins of hers. If we're lucky, some of them may be counselors and therapists. Or . . . I don't know. Run rehabilitation centers."

"If not?"

"If there aren't, some can be made. Everyone's related to everyone, if you go back far enough. We'll just go back until the right people are connected to her."

"You sound like Avasarala," Naomi said.

"I've been thinking about her a lot. I feel like I built a little version of her in my head. You ever have that feeling?"

"I know the one," Naomi said. And then, "Teresa doesn't just need a place to land and some sort-of relatives. She needs love."

"She had love. Her father loved her. He really did. What she didn't have was a sense of proportion."

"And then you brought her here."

"She brought herself," he said. "Just like we all do. And it's a pain in the ass for each and every one of us, every time it happens. Outgrowing your family? Hard work under the best of circumstances. Which these aren't."

She lay down, snuggling into his arm. He was sweat-damp, but she didn't care. She stroked her fingertips across his forehead and down his cheek. He turned his head, pressing into her hand like a cat that wanted petting.

"Do you think she'll be okay?" Naomi asked.

"No idea. She will or she won't. Either way, it's going to be up to her. I'm pretty sure she'll be herself while she does it, though. That's a victory for her. We'll help if we can. If she'll let us."

The alert went on. Ring passage in five minutes. Jim sighed, stood, and started changing into fresh clothes.

"What about you?" Naomi said.

"What about me?"

"Will you be okay?"

Jim smiled, and there was only a little weariness in his eyes. Only a little sorrow. "I played a long, terrible, shitty game, and I won. Then after I won, I made it back home. I'm waking up in the morning next to you. I'm perfect."

Chapter Fifty: Elvi

The day after Teresa escaped, Elvi spent the hours before dawn watching the feeds. As soon as the violence ended, even before the wounded and the dead were sorted, the stories began taking shape. The differences between the state newsfeeds and the security reports Elvi saw in the aftermath made it sound like there had been two different battles. The separatist terrorist forces, each of them tracked as they fled for the ring gate, had been driven back by the overwhelming power of the Laconian Navy. Or else the enemy had achieved all its apparent objectives and withdrawn of its own accord. The orbital weapons platform network and land-based rail guns had successfully protected Laconia from the enemy's last-ditch suicide attack. Or else the underlying assumption that the platforms and the base would be support for a naval defense had, in the heat of the moment, been ignored. And the enemy losses, while real, hadn't been catastrophic. The enemy was in flight, and the threats to Laconia required little more than a mopping up. Or else the *Whirlwind* was going to be stuck close to the planet for the foreseeable future while a handful of destroyers hunted down the stray torpedoes and rocks that had been launched at the planet, any one of which could cause massive damage.

The most breathtaking lie—the one that put all the others to shame—was that the construction platforms had been taken down before the attack could reach them, and were being brought back to full operation in a secret location to protect them from further attack. The other stories about the battle might be extreme readings of the actual text, but the construction platforms were no more. There was no version of reality that supported the state's claims that they had survived. The former shipyards of Laconia were

a collection of junk scattered in orbit around the planet, and no number of horses and men were going to put them together again.

Added to that were all the things that the newsfeeds simply didn't mention: That a fast attack frigate had landed within spitting distance of the State Building. That the high consul's daughter had run away with the enemy in what might perhaps be humanity's newest record-setting act of teenage rebellion. That the prisoner held in the State Building had also escaped.

Or that one prisoner had, anyway.

"Major?" the young man said. "Admiral Trejo is ready to see you."

The lobby was a wide space with sandstone-colored columns and enough sofas and chairs to seat a hundred people. She was the only one there.

"Doctor," Elvi said.

The young man looked confused. "I'm sorry?"

"I'd prefer you call me doctor. Major is an honorary rank. I earned my doctorate."

"Yes, Dr. Okoye. Of course. The admiral . . ."

"Is ready to see me," she said, standing up and pulling her tunic straight. "Lead the way."

The meeting wasn't in one of the usual rooms. No formal desk, no volumetric display, no small crowd of men bowing to the power of the state and jockeying for their status in it. It was just her and Trejo in a private dining room. He had a simple breakfast of coffee and fruit with a sugar-iced pastry, and another like it set aside for her. A window almost as wide as the whole wall looked out over the snow-covered grounds and the land beyond all the way to the horizon. It felt a little obscene to think about the violence that had shaken it all. That they weren't both underground in a high-security shelter felt like another kind of lie.

"Admiral," she said, sitting. The young man left immediately. Trejo poured her coffee himself.

"We found Ilich," Trejo said instead of hello. "Well, his body anyway. He and two of the state guard were assassinated by the separatists."

Elvi waited to feel something about that. The familiar, professionally thoughtful man she'd worked with was dead. She would never see him again. It wasn't the first time she'd lost a colleague. Back before anyone called her major, she'd taught at an upper university that had three of her fellow faculty members die in the same semester. She'd lost most of the science staff of the *Falcon*, and it had been devastating. This wasn't. Where the shock and sadness should have been, there was just an oceanic depth of resentment. She wasn't even perfectly clear whose name belonged on it. Duarte. Trejo. Holden. All of them together.

"Too bad," she said, because she felt like she ought to say something.

"He was loyal to the empire," Trejo said. "Whatever his failings were, he was that."

She didn't know what she could say to that, so she didn't say anything.

"Our situation has once again changed," Trejo said, and paused to blow across the surface of his coffee. He didn't just look exhausted. He looked ten years older than when he'd arrived, and things had been broken beyond repair back then. Another few years like this, and Trejo would be the oldest man alive, no matter his age. She remembered a myth about someone wishing for eternal life, but forgetting to ask for youth to go with it. In the story they'd gradually shrunk and withered until they turned into a cicada. She wondered if Fayez knew who the story was about.

She realized again that Trejo was waiting for her to respond. She didn't know what he wanted her to say and didn't care much either.

"Are you feeling all right, Major?"

"Doctor," she said. "I think it would be best if you called me doctor. And I'm fine. I've had a lot on my plate recently. I'm sure you understand."

"I do. I most certainly do," he said. "The construction platforms. The stick moons, they called them. They were what drew the high consul's attention to Laconia in the first place. Did you know that? He saw them in the first wave of scans that came through when the gates opened. There was a vessel—something like a vessel—halfway built in one of them."

"I'd heard that," Elvi said. The coffee was good. The pastry was a little too sweet for her liking.

“They are the foundation of Laconian power.”

Jesus Christ, Elvi thought. Had Trejo always been this sanctimonious and she just hadn’t noticed? Or was she just really irritable right now?

“They stole a goal on us,” he said. “I will give them that. They found a dirty trick, and we fell for it. Once. It won’t happen again. I need you to put aside the other issues you’re looking into. For the time being. I know what you’re going to say. ‘Another first priority.’ ”

“That’s where I would have started, yes,” Elvi said.

“The loss of those platforms is the loss of the most powerful ships humanity has ever made. It’s the loss of antimatter production. It’s the loss of the regenerative tanks. Without them, we lose the ability to project our power out beyond the system. Whether we’re fighting against the terrorists or the things beyond the ring gates, we need that ability.”

“So whatever the high consul has become gets shelved,” she said. “Figuring out the nature of the enemy and the weird system-wide attacks gets shelved. The secret of immortality? Shelved.”

“I can hear your frustration, and I share it,” Trejo said, “but the fact remains—”

“No, I’m good with that. But making more weapons isn’t the first priority,” she said. She took out her handheld, pulled up her notes, and passed it over. “That right there? *That* is my first priority.”

Trejo scowled at the display like she’d handed him some particularly unpleasant insect. “Adro system?”

“The big green diamond that looks like it might have a record of the entire protomolecule civilization. Rise and fall. I would probably get the best results if the *Falcon* were repaired and crewed with a team specifically chosen for this project. I have some names drawn up. I’ll send them to you.”

“Dr. Okoye—”

“I understand I’m not in a position to force you to do anything. But I’m comfortable in the belief that all of the issues we’re trying to deal with are connected, and that”—she pointed at the schematic of the massive diamond—“looks more like the Rosetta stone than anything else. So that’s where

I'm putting my efforts. In my professional judgment, it makes more sense than building bigger explosions or chasing after the fountain of youth."

Trejo put down the hand terminal. His coffee sloshed over the lip of its cup, staining the white linen. "We are in a war—"

"Yes, you should fix that too."

"Excuse me?"

"You should stop being in a war. Send the underground a fruit basket or something. Start peace talks. I don't know. However that works. I said it before, and I meant it. If you want peace, lose gracefully. We have bigger problems."

She took a last bite of the pastry and washed it down with the dregs of the coffee. It tasted better with the bitter following the sweet. Trejo was stone-faced. She stood.

"Do what you need to do," she said. "I'm going to get ready for work, and then I'll be in the lab at the university. If you want to throw me in prison for insubordination or whatever the military term is, that's where you'll find me. If you want to fix this, let me know when the *Falcon* can be ready, and I'll brief you on everything I find."

He didn't respond. She nodded curtly and walked away. She'd hoped she would feel better, and she did. But only a little.

The wide sky of Laconia had cleared. The snow clouds were gone, and the air was crisp and bright with just a hint of the spearmint smell of freshly turned Laconian earth. A flock—or swarm—of something flew high in the sky, vanishing against the sun and reappearing on its collective way to the south. Some organism following a temperature incline or a nutrient gradient or some other more exotic drive she didn't know about. That no one knew about. Not yet.

They would, though, someday. If she could fix all this.

Fayez was awake when she got back to the rooms. He sat on the edge of their bed in the soft cotton pajamas that the Laconian Empire provided them gratis. He was massaging his new foot the way the physician had told him to. He looked up at her, worried. He hadn't slept since the night before either. They'd gotten back to their rooms cold and weary, and also in

another kind of shock. She had been a pawn in Holden's chess game. And Holden had gotten her to the last rank and promoted her to a queen.

"Well? How's Trejo?" Faye asked, mordant and hopeful. "Are we exiled?"

"No such luck," Elvi said. "Maybe later."

"We could still leave." He was only partly joking. She imagined what it would be like. Getting the *Falcon* back. Or any ship, really. If they got off Laconia, they could go anywhere. Trejo wouldn't have the resources to chase them. Not now. They could go back to Sol or Bara Gaon or one of the new, struggling colonies. They could leave all this bullshit behind.

Except that something out there was looking for a way to snuff out their minds. And there wasn't a better place to fight against than right here. Her prison wasn't Laconia. Her jailer wasn't Trejo. The thing that had taken all her choices away was that this mystery so clearly needed to be solved, and she was so clearly the best one to do it.

She kissed her husband softly, and on the lips. When she pulled back, the humor was gone from his eyes. They'd been together for so long. They'd been so many different people together. She felt the change coming again. She was entering a new part of her life now. It meant packing away all her stories about how she was only here from fear of the authorities. The authorities were broken. She was here because she chose to be, and that changed everything.

"I'm sorry," she said. "I know you were hoping for a gentlemanly retirement someplace that would give us both tenure."

"Or just one of us," he said. "I'm not greedy."

"We don't get to have that. And I'm sorry."

Faye sighed, crossed his legs. "If we don't, we don't. I still have you?"

"Always."

"Good enough," he said, and patted the mattress at his side.

"I have to go."

"Mixed signals," he said.

"I'll be back after work."

“You say that now, but I know you. You’ll find something interesting and stay up until midnight chasing it, and by the time you come home, it’ll be time to leave again.”

“You’re probably right.”

“It’s why everyone needs you,” Fayez said. “It’s why I need you too. When you get back, I’ll be here.”

“Thank you,” she said.

“I’m sorry we couldn’t run away together.”

“Maybe in our next lives.”

The universe is always stranger than you think.

It didn’t matter how broad her imagination was, how cynical, how joyous and open, how well researched or wild minded. The universe was always stranger. Every dream, every imagining, however lavish and improbable, inevitably fell short of the truth.

Elvi had been born in a system with a single star and a handful of planets. She’d studied exobiology when it was still theoretical. When she’d been a newly minted PhD, her greatest dream was that she might get a research fellowship on Mars, and maybe—the pinnacle of all her wildest hopes—find some hard evidence that life had evolved there independently. It would have been the most astounding, important thing she could imagine. She’d be in the scientific histories as the woman who’d discovered living structures that came from someplace besides the Earth.

Looking back, the dream seemed impossibly small.

At the labs, she stopped to have a long talk with Dr. Ochida. She wanted a rundown of all the research being done—where it stood, who was heading up the projects, what his opinions were of the experimental designs. Even after Cortázar had died, she hadn’t done that. Hadn’t acted as though the labs were hers to run. Now she did, and Ochida didn’t object. That probably made it true.

At any rate, he answered everything she asked, and Trejo hadn't sent any guards to drag her away. So she was effectively in control of the most advanced research facility in the history of humankind. And if there was one thing that her decades in academic science had drilled into her consciousness, it was that power meant policy.

"We're going to need to make some changes," she said. "We're shutting down the Pen."

Ochida actually stopped walking. She could have said that all the science teams were now required to walk on their hands, and the man would have been less astounded.

"But the protomolecule . . . The supply . . ."

"We have enough," she said. "Our reason for collecting more died with the construction platforms."

"But . . . the prisoners. What do we do with them?"

"We're not executioners," Elvi said. "We never should have been. When the guards come, tell them we don't accept the transfer. If Trejo wants to line people up against the wall and shoot them, I'm not in a position to stop that. But I can say we won't support it. And we won't base our research on it. From here on in, informed consent or work with yeast."

"This is . . . This will . . ."

"Speed isn't the only measure of progress, Doctor," Elvi said. But she could tell from his eyes he didn't know what she meant. "Just get it done. All right?"

"Yes, Dr. Okoye. As you see fit." He almost bowed as he retreated.

The universe is always stranger than you think. Elvi went to her private lab. There were so many things to do, so many possible pathways to follow in the research. She could keep the secret of Duarte's condition, or she could make her own research group, pulling from the best minds in Laconia. Trejo's conspiracy was down to just the two of them and Kelly anyway. And with Teresa on the run with James fucking Holden, treating it as a state secret was more and more ridiculous.

The chair seemed more comfortable now that it was hers. She knew it hadn't actually changed, but she had. She pulled up her waiting messages

and ran through them. The most recent one was from the shipyards, giving her an unscheduled update on the status of the *Falcon*. She took it as an olive branch from Trejo.

As she went through the list, she felt herself growing calmer. More focused. The complicated, obscure world of politics and intrigue fell away, and the complicated, obscure world of research protocols and alien biology took its place. It was like coming home. Fayez had been right. She was going to be there until morning if she wasn't careful. But whatever she did, whatever path she took, the first step was the same. Even if it was a bad idea, it was necessary.

The black-eyed children watched her as she went to their cage. Cara stood up, coming to meet her the way she often did. When Elvi undid the lock and slid the cage door open, Cara stared at it, confused. Her little brother walked to her side, slipped his smaller hand in hers. Elvi stood back, nodding to them. For the first time in decades, the two children stepped out of their cage freely. Xan's little chest was heaving in and out with the emotion of it. A tear slipped down Cara's grayish cheek.

"Really?" Cara whispered. She meant, *Are we really free?*

"There are some things I have to figure out," Elvi said, and her voice was trembling too. "I hoped, if you're willing, that you would help me."

Epilogue: Holden

Holden lay strapped in the autodoc, his eyes closed. The ship was on the float, conserving the last of their reaction mass. He didn't mind. Weightlessness was a visceral reminder that he wasn't on Laconia anymore. He loved it for that.

The machine ticked and hummed in a vaguely disapproving way, like it was trying to tell him to exercise more and cut back on salt. There were voices in the background. There were always voices in the background these days. After so many years with a skeleton crew, having a full complement felt like having a party where too many people had showed up and no one was leaving.

A needle slid into his left arm, and the autodoc chugged to itself, pumping in his own peculiar cocktail of oncocidals and antiagathics and blood pressure stabilizers. And probably something for psychological distress. Lord knew he had that coming. The coolness gave him a pins-and-needles feeling on his lips, and he tasted something that his brain tried to interpret as peanuts. When it was done, the needle withdrew and a thin scanning bar on an armature came out and waved a wand along his face. An image of his skull and lips appeared on the screen, with the new growth in green.

"All the parts in the right place?" Naomi asked from the doorway.

"Most of them," Holden said, and the scanner beeped at him, chiding. He stayed still while it finished. When the armature retracted, he said, "It does feel pretty fucking undignified to be teething at my age."

"Well, they knocked your tooth out," Naomi said. Her tone was mild, but he could hear the murder behind it. He played it all down, but she knew.

All the time he'd been under Laconian control, he'd made light of things. He'd made rules for himself so that his powerlessness didn't turn into despair. He'd plotted and planned and watched for opportunities. Now it was over, and everything he'd been careful not to feel was still waiting for him.

"My dad used to say something when he'd been traveling," Holden said as the autodoc finished its run.

"Which one?"

"Father Caesar. He used to say that when you went too far too fast, your soul took some time catching up to you."

Naomi frowned. "I thought that was how religious fanatics argued that Belters didn't have souls."

"Might have been that too," Holden said. "Father Caesar was talking about jet lag. Anyway, I was thinking about it with just . . . change. You know?"

He didn't talk about the day he'd been arrested much. Not with anyone besides Naomi. He'd been taken into custody on Medina Station, held for questioning. Not sure if he was going to live the rest of his life in a box or be slaughtered as a warning to others. And Governor Singh had shipped him back to Laconia for questioning about the aliens that had made the rings and the other aliens that had killed them. And through the first part of it, and then again on and off all the time he'd been gone, he'd had the sense that none of it was really happening. Or that it was, but not to him. He'd become someone else. Being a prisoner had driven him a little crazy for a while, and he still wasn't right. Not really. But every day he woke up on the *Roci* with Naomi beside him and Alex in the pilot's chair, he felt a little closer to sane. His soul a little bit nearer, in a wide and metaphorical sense.

Naomi pushed off, floating to him, and catching herself with the unconscious grace of someone born to it. She took his hand. She did that a lot these days. He liked it too. Especially when he woke up in the middle of the night, too groggy from sleep to know where he was, and started to panic that the guards were coming to beat him again. Her voice calmed him down, but her hand in his worked faster.

“We’re going to start the braking burn in about forty minutes,” she said.

“Hard?”

“Alex says about three-quarter g. We’ll be fine. But I thought I’d let you know anyway.”

“We won’t be trapped in the same couch for hours.”

“Well, not by that, anyway,” she said. He didn’t know if the sly sexual banter was sincere or just another way of telling him he was home. It soothed him either way.

“Just between us?” he said. “I’m going to be glad when it’s just us again. These are nice folks, but they’re not family, you know?”

“I do,” she said. “We might . . . we might need to talk about hiring someone on, though. With Clarissa and Bobbie both gone.”

“Yeah,” he said. “We’ll look at it.” He meant, *But not now. Later. When I can.* She heard it all.

“I’m going to go check the coolant feed lines,” she said. “These kids all grew up on newer ships. They’re not used to our heat tolerances.”

“All right,” Holden said. “I’m going to finish this and head for the flight deck.”

“Sounds good,” she said, and pushed backward, keeping her eyes on him as she moved away to the door and caught herself without even looking.

After she was gone, the autodoc chimed, giving him permission to unstrap himself. He moved slowly not because he hurt, but because he liked the sensation of freeing himself. The report was on the screen when he got there. All in all, it was pretty solid. He pulled up a record going back to his return to the *Roci*, and all the trend lines were going the right way. So there it was in clean, glowing lines. His soul on its way back.

It would be good to feel like himself again. Naomi was stuck as the central planner for the underground as it transitioned to whatever came next. But she’d made it very clear that one run as captain of a gunship on campaign was more than a lifetime’s worth for her. The captain’s chair of the *Rocinante* was his. Though, since she was still nominally the admiral of

the resistance fleet, his captaincy felt a bit like an emeritus title. Even so, there were responsibilities that came with it. If not now, then soon.

He hesitated, then pulled up Amos' record. There was no data. He thought about it for a moment. He didn't want to have the talk, but he was going to have to. If he was going to be the captain again, he was going to have to be the captain again.

He stopped by the galley first for a bulb of coffee and a printed length of something that the system called mushroom bacon. Three of the new crew were floating near a table, and he felt them watching him in the same way people sometimes did in bars or the corridors of stations. *Is that James Holden?* He'd been able to be oblivious to it before. Now he felt their attention like they were pointing a heat gun at him. He pretended not to notice their interest and headed for the machine shop.

Muskrat floated in the middle of the room, a complex diaper on her haunches with a hole for her tail. She started wagging as soon as Holden came in. It made her gyrate around a center of mass defined by her larger and mostly still body and her lighter and fast-moving tail. Holden tossed a thumb-sized bit of the bacon at her mouth, and she caught it.

"You're getting better at that," he said to the dog as it chewed noisily.

The machine shop was perfectly familiar. The smell of high-grade lubricants and the residual heat of the machine printers, the old sign still in place where it had been. SHE TAKES CARE OF YOU. YOU TAKE CARE OF HER.

A clanging came from inside the deck, two sharp, percussive strikes, and then a grunt. The slide of a body moving through a crawl space.

"Hey, Cap'n," the thing that had been Amos said, pulling himself out from under the decking. He had a wrench in one hand and an air filter in the other. His skin was still a sickly gray, and it left him looking cold. Like someone who had just drowned.

"Everything going all right?" Holden said, gesturing at the dog with a forced cheerfulness.

"So far. Turns out there's a lot of people been thinking about how to have dogs on a ship. I'm just looking at what kinds of solves they've come

up with.” He let the tools float and scratched the dog’s ears, stabilizing her jaw with his other hand so she didn’t drift.

“Seems difficult,” Holden said.

“It ain’t all dignified. I’m putting together a traveling kit for Tiny. Figure anyplace she heads for, she’s taking this one. Hard part’s the filters. Turns out these dogs throw off a lot of fur. Gums the standard recyclers up pretty quick if you don’t catch it first.”

Holden braced himself with a handhold. Muskrat tried to turn toward him, but didn’t have anything to push against.

“Have you heard about Teresa having any plans?” Holden asked, avoiding the conversation he’d come here to have.

The mechanic took the filter and started running his thumb along the edge, inspecting it by touch. The blackness of his eyes made it hard to know what exactly he was looking at.

“Nope. Last I saw, she and Alex and one of the new kids were all talking about Martian entertainment feeds. Apparently one of the ones she was into, Kit watched when he was her age. I think Tiny likes having something in common with people, even if it’s just the films they’ve watched.”

“So I was at the med bay just now,” Holden said. “I noticed you hadn’t been by.”

“Yeah, well. Autodoc isn’t so clear on what to make of me these days.”

“Yeah,” Holden said. “About that.” He hesitated. He didn’t know how to ask if the thing in front of him was really Amos anymore.

“What’s on your mind?”

“Are you really Amos anymore?”

“Yup.”

“No, I mean. Amos . . . died. He got killed. And then the repair drones took the body, and . . . I need to know, are you really Amos Burton? The Amos I knew.”

“Sure am. Anything else?”

Holden nodded more to himself than to anyone else. Muskrat whined and tried to swim over toward him, paws flailing in the air. He reached out

and pulled the dog over, bracing her against his knee and patting her back. "I just think it's important."

"Seems like you're having a hard time taking yes for an answer, Cap. Here's how I look at it. Yeah, I went through some weird shit. It changed me. I know some things I didn't know before."

"Things like what?" Holden asked, but Amos waved the question away.

"Thing is, you went through some weird shit too. You got changed. Know some things you didn't know going in. Naomi and Alex? Same. Hell, Tiny's barely related to who she was the first time I saw her. That's just life." Amos shrugged. "I guess the dog didn't change much, except she got a little gray around the muzzle."

Muskrat wagged.

"You want this to be a philosophy question, that's fine," Amos said. "But if you're asking am I still me? I am."

Holden nodded. "All right. I had to ask."

"No problem," Amos said.

Holden scratched Muskrat one last time. A little cloud of hair floated free, the strands clinging together in complex webs and drifting toward the air recycler. "I see what you mean. Alex is starting our braking burn in twenty-five, thirty minutes."

"I'll make this all safe by then," Amos said.

Holden pulled himself to the door. As he was about to leave, Amos' voice pulled him back.

"One thing, though?"

He braced in the doorway. Amos' eerie black eyes were on him. "Sure."

"Those things that Duarte pissed off? The ones that ate Medina?"

"I know the ones you mean," Holden said.

"One of the things I know now is that they're going to kill everybody."

They were silent for a moment.

"Yeah," Holden said. "I know that too."

Acknowledgments

While the creation of any book is less a solitary act than it seems, the past few years have seen a huge increase in the people involved with *The Expanse* in all its incarnations, including this one. This book would not exist without the hard work and dedication of Danny and Heather Baror, Bradley Englert, Tim Holman, Anne Clarke, Ellen Wright, Alex Lencicki, and the whole brilliant crew at Orbit. Special thanks are also due Carrie Vaughn for her services as a beta reader, the gang from Sakeriver: Tom, Sake Mike, Non-Sake Mike, Jim-me, Porter, Scott, Raja, Jeff, Mark, Dan, Joe, and Erik Slaine, who got the ball rolling.

The support team for *The Expanse* has also grown to include the staff at Alcon Entertainment and the cast and crew of *The Expanse*. Our thanks and gratitude go especially to Alex Cabrera-Aragon, Glenton Richards, and Julianna Damewood.

A particular debt of gratitude is also owed to Jeff Bezos and his team at Amazon for their support of the project in all its forms.

And, as always, none of this would have happened without the support and company of Jayné, Kat, and Scarlet.

The Last Flight of the Cassandra

My name is James Holden and my ship, the Canterbury, was just destroyed by a warship with stealth technology and what appear to be parts stamped with Martian Navy serial numbers. Data stream to follow.

“Well,” Darius said. “We’re fucked.”

Amy’s voice came up to the flight deck from the galley below. “Are we fucked again, honey?”

With the Cassandra on the float, “down” was a convention more than a direction, but Darius had grown up on Earth, and perception is a habit. He saw her as rising up to him. Her hair was in a bun. Her sweat-stained sleeveless undershirt revealed the tree-shaped electrical scar that ran down her left arm. She wasn’t his wife, and she wasn’t not his wife. Back in Paris, that might have caused problems for their Basic registration forms. Out here on the ship, she was just Amy, and he was just Darius, and what they were to each other didn’t need a bureaucrat’s stamp.

Darius gestured to the screen with one angry thumb.

“You see this asshole?” he asked, scrolling the feed back to the start of the message. My name is James Holden.

“Sure,” Amy said, grabbing onto a handhold and pulling herself to a stop. “It’s all over. Everyone’s rebroadcasting. What’s he to us?”

“He’s why we’re fucked.”

A thin line appeared on Amy’s forehead the way it always did when she was getting annoyed. The heat did that. They’d been leaving the ship five degrees warmer and the oxygen mix thinner than usual. It

saved money, but it made them all more irritable. All except Lester, who was unchanging in his irritability.

“The Canterbury,” Darius said. “It’s a water hauler.”

“Saturn to Ceres,” Amy said. “We’re not on that run.”

“The market’s the market. Ceres won’t let itself go dry, so it ups the orders from other places. Ships that were heading for Pallas and Vesta go to Ceres. Luna gets in on it. It’s straight supply and demand. Less ice on the market means it costs more to fill the tanks.”

“We’ll be alright,” Amy said.

“We won’t. We’re running at the edge now. There’s no more fat we can cut off the budget.”

“We have savings,” she said, but they both knew they didn’t.

The Cassandra wasn’t a great ship. In truth, she was barely even a good one. A bubble of steel, ceramic, and air with a fussy Epstein Drive and third-rate recycling systems. They called her a rock-hopper, and even that was a shade more dignified than she deserved. But if she had a fatal flaw, it was that she was thirsty. Her heat radiators didn’t have the surface area to shed as fast as Darius would have liked. There were other fluids they could have carried to let out onto the ship’s skin to evaporate away, but none that they could also use as reaction mass and tea.

And where they worked made things worse.

The Aten asteroids spent most of their time sunward of Earth’s orbit, crossing out for a third or a quarter of their time. Sometimes less. They’d been accessible in the first days of humanity’s expansion into the void, and so they were some of the first to be mined. The titanium and platinum and nickel-iron had made fortunes that had grown to the size and power of nations. And some that had withered into shame and history. The push out and out and out into the system—the main belt, the moons of Jupiter and Saturn—had left them behind. But generation by generation, the mining

technologies had improved. Now ore that had been exhausted generations before was rich enough for the new techniques to wring out a little more. But only for ships willing to add the sun's punishing light to their drives' waste heat. Sundivers, they were called. It was a good way for a crap ship to grind out enough capital to upgrade. It was also a good way to fail out. Or get killed.

Amy looked away. A sheen of tears covered her eyes, and she grabbed a strap of undershirt to wick them away.

"Get the others, will you?" Darius said, more gently. "I think we need to have a talk."

"Yeah," she said. "All right."

She pushed herself back down in a spiral that put her back to him. He was sorry now that he'd led with his despair. Usually he was better at waiting for his own private darkness to pass before he brought Amy into it. The news had caught him unawares.

The rest of the crew were just Lester and Abril. The four of them living in a space smaller than the flat he and Amy had taken in Paris. He stretched and yawned. The heat in the flight deck was sapping his energy. The breeze from the air recyclers was slow and weak. The thinness of the air put an ache behind his eyes that he knew from experience wouldn't leave until they pumped more oxygen into the system. Which they could get by splitting some water, if they'd had any to spare.

He heard Lester and Amy below him. The concern in the man's voice, the sharp humor in the woman's. And Abril's accented murmur like music. He didn't want to do this.

The Cassandra had been a fluke for him. A dream. He'd been living on Basic in a suburb of Paris, spending his days sleeping and his nights playing drums—actually ancient plastic buckets turned mouth-down—with a street band. He and Amy had used the tips to buy cheap marijuana cigarettes from the drugstore dispensers and smoke them with her friends. For Darius, it had felt like having all the

time in the world and no time at all. Every day a day where nothing happened except you had one fewer. He'd felt like he was drowning.

And then his parents had both died in the same wreck. They'd left him a bank account with actual money, a two-bedroom house in Bangui, and a choice—uproot his life in Paris and go back to live out his days in the same house he'd been in as a child, or sell the house and live off the money until it was gone and he could go back on the Basic rolls.

He had taken a third option. Two tickets to Luna, a down payment on a used rock-hopper, and a call for crew who might keep the ship alive long enough to turn a profit. He'd wanted to name his new ship the Icarus, but it turned out that every sundiver with their eyes on the Aten and Apollo asteroids had the same idea. There were over two hundred ships already named some variation of Icarus. So they'd named it for Amy's baby sister. He learned later that Cassandra was also pulled from mythology, but he'd never gotten around to reading the story.

And just like that, the nature of his life had changed. There were probably thousands of other things he could have done with his inheritance, but this was the one he'd chosen. If he'd gone to Luna, then he'd be eking out meals and a bed there. If he'd joined up with a ship he didn't own, he'd have been out in the black somewhere. Maybe dead with the Canterbury. If he'd left Amy behind, he'd be waking up next to someone else or no one. His life was defined by all the paths he didn't take. And yet somehow, he'd picked the one that had this meeting in it.

Lester was an older man—gray, close-cut hair and pale skin with a scattering of freckles. Abril was Amy's age, with a musical voice, straight black hair, and a strong aversion to being touched. That she was half a meter taller than any of the rest of them and that her head was just a little out of proportion had stopped being strange to Darius months ago. He looked at her and instead of thinking Belter, he thought Abril. That, he thought, was what being a crew meant.

“Que kennst?” Abril asked Darius as he pulled himself into the tiny galley they used as a meeting room. He silently translated it. What’s on your mind? Lester, scowling, looked like he already knew, and Amy wouldn’t meet his eyes. The heat of the ship was like being locked in a sauna.

“You all know how thin the last runs were,” Darius said. “Well, we caught another bad bounce. With water prices going up, I don’t see how we make another run and stay safe. We’re already late replacing the microfilters. And every drink of sour water reminds me we ought to have flushed the H2O reclamation feed lines last time we were in port. Even if we make the docking fees...”

He sighed. He was dancing around it. Better to say the words and be done.

“This is our last run. When we get back to Luna, I’m putting the Cassandra up for sale. I’ve looked at the going rates, and I can’t make enough to break even. So this... is going to be it. I’m sorry.”

His crew didn’t say anything. Not even Amy. He pulled himself up to the flight deck and watched newsfeeds for the rest of the shift without really seeing anything. He’d dreamed of making a go of prospecting. Enough money to upgrade the ship or trade it for a new one. Something robust enough to head out for the Jovian moons, maybe. Try his luck in the mainline belt. And now that wouldn’t happen. All those possible futures, cut away. His life redefined again. Another path he didn’t take. He left them there to grieve together while he grieved alone.

* * * * *

“What if we found clean ice?” Lester said. “Pure enough we could process it on the ship? I mean, yes, it would mean buying new filters a little sooner, but look at how much we’d save, yeah? Drop our overhead that much, and we could afford at least two more runs. And safely.”

Lester's machine shop was hardly more than a wide spot in the hall down near the reactor, but he'd made it his own. The gray metal work stool was painted with emerald-green flowers on silver vines. The drawers and tool shelves were engraved with complex designs. What-ever else Lester might be, he was an incorrigible artist.

Darius folded his arms across his chest like he could hold in the ache. "You have something in mind?"

Lester grinned and pulled up the familiar map of the Aten asteroids. The first time Darius had looked at it, it had felt like watching snow. Now, he saw the patterns in it. Lester shifted the display, lighting up and darkening whole arcs of stone and ore, until only one remained.

"Xi-Mallow 434," Lester said.

It was a small marble of a rock. Not technically an Aten, since it never crossed Earth's orbit. It didn't even make it out as far as Venus.

"It's locked," Lester said. "Always the same face to the sun. Which means always the same face away from it too. Shadowed. If there were ice on the back end of that, it would stay there forever. And looking at visual—" The display jumped. A black dot caught against the sun's corona, pulled up and enhanced until the details hidden in the darkness came clear. "That looks glacial to me."

"How far?"

"It's not perfect," Lester said, "It'll mean a two-day burn to match orbit. But we can do it if we skip 19-Daedelus. Just swap them out on the schedule and change our angle a little before we light the drive up. It's not that big a deal."

Darius felt hope stealing into his chest like an assassin. He shook his head. "No. Free water just sitting here, waiting for someone to come along? People have been scraping at these stones for generations. No way they leave that sitting there all this time."

"That's what I thought," Lester said. "But look. Most of the work gets done closer to Earth orbit. This one never gets that far. It's almost a

vulcanoid.”

“Still,” Darius said. “It has to be high-albedo silicates or something. Not ice.”

“And...” Lester looked away. Darius felt the hair on his arms stand up.

“And?”

“It’s under UNN military quarantine,” Lester said. “It has been for a hundred and sixty years. All the prospecting lists neglect it. It doesn’t even show up as an option.”

“Military. Quarantine.”

“You never served, Dar,” Lester said. “You don’t understand. You think military means well-regulated, controlled, everything buttoned down. I did my twenty, and I’m telling you it’s not like that. You heard the story about the guard and the bench?”

“The what?”

Lester waved a hand like he was erasing something. “Old story. It goes like this. There’s a fort that gets a new commander. Guy comes in, and he tours the place, and in the middle of the yard, there’s this old bench with a guard stationed beside it. Every shift, the guard changes. Twenty four hours a day, seven days a week. Rain, snow, or storm. Doesn’t matter. There’s always a guard there. So the new commander gets curious. Looks into the records to see why. What is it about this bench that it needs that much attention.

“It takes him weeks to find it, but he does. Fifteen years before, someone painted the bench and the commander put a guard there to make sure no one sat on the wet paint. No one ever rescinded the order. Everyone just forgot.” Lester grinned. “That’s what it’s like. Things fall through the cracks all the time. Always. And this is one like that. I can feel it.”

Darius felt the objections rising up in him like bubbles in a beer. Even if Lester was right, other ships might have broken the

quarantine and hauled off any good ice decades before. Or maybe there was no good ice. Or maybe the whole place was lined with decaying nukes set by someone's paranoid great-grandfather and just waiting for anyone to touch the tripwire. All the reasons not to. And the one argument in favor: that Lester had thought of all the same things and still wanted to try. That the Cassandra meant enough to his crew that they'd take a risk for it. And if Lester would, how could Darius do less?

"Let's figure a course," he said. "Then we take it to Amy and Abril. No pressure, no persuasion. Just lay out the option, and if anyone balks, we don't. Agreed?"

Lester grinned. "Unanimous or nothing."

It wasn't nothing.

The burn was designed not for speed or comfort, but to minimize waste heat. Even then, they agreed to let the internal temperature rise another half degree rather than spend the water to cool the ship, and the recyclers were doing their best to keep the ambient humidity low. Darius sat in his couch, sweating, and his dreams weren't about wealth or freedom. They were about winter mornings along the Seine and the feeling of ice cubes against his lips. The sounds of the ship changed with every degree of temperature rise as heat expansion changed the tensions and altered how the ship fit together. As soon as they had their orbit set in, Abril shut down the reactor. Even the radiative heat from the sun kept the ship's temperature ticking slowly upward. A point would come, Darius knew, when they'd have gone too far, where the balance of heat and water would mean that all the paths back to Luna ended with them baked to death in their couches. There wouldn't be a warning, either. They could sail past the point of no return without noticing it if they weren't careful. Whenever there was nothing else to do, Darius ran the numbers and planned his exit strategies.

Xi-Mallow 434 was a dot of black, but it grew larger as they got close. At its farthest point from the sun, it was still well inside the

orbit of Venus. The solar disk felt oppressive and huge. The braking burn meant taking the temperature up another degree. Even if there was no ice, there would be shadow. Darius felt himself growing hungry for just a little darkness to park the ship in. He had the irrational certainty that the Cassandra's heat sinks would melt, fuse, and lose their surface area.

The braking burn was short and harsh. The supply of reaction mass dropped quickly, the heat rose fast, and Darius watched, unable to affect anything. Then Abril shut the reactor down again, and they were on the float and moving into the pencil-thin shadow of the asteroid. Darius pulled up the external cameras in time to see the silhouette of Xi-Mallow 434 against the vastness of the sun. A dead-black iris in a vast and burning eye. In his baking-hot ship, he shuddered.

"I've got a few places for a decent dock," Amy said. "I'm not seeing any structures, but there are some flat spots we could anchor on."

"Let's take this slow," Darius said. "Coming out all this way to heat shock the hull would be a stupid way to die."

"Dychanie lloga es," Abril said cheerfully. It was a Belter idiom about the transience of life. Darius thought it literally meant "breath is rented".

"Lester?" Darius said. "Make me happy."

"Be happy. That out there? It's not silicates. It may be a little dusty, but it's ice."

Darius closed his eyes, relief flooding into him. "Amy, pick a mooring spot. We'll let the ship cool down before we snuggle up and spill a little heat—"

"Conduction!" Amy sang out like a victory cry.

"—and let's go do a little prospecting. Lester and Abril, meet me in the airlock."

He undid his straps, pulled himself up from his couch. Amy grinned at him, and he pulled himself in to kiss her. Her lips were salty.

“Keep the comms up too,” he said softly. “If the UNN starts coming for us, I’d like to be someplace else.”

She made a mock salute. Humming merrily to herself, she went back to mapping possible landing sites on the asteroid, and he went to the airlock. The others were already waiting. It took an hour to get all their equipment together—suits, kits, core samplers—and by then Amy had picked a place for them. It was flat, and the stone had been melted at some point recent enough from a geological perspective that the cooled surface was stable.

Once the Cassandra was in place, Darius cycled the lock and they went out. It had been a while since he’d heard Abril and Lester through the suit radios instead of the shipboard air, and the thinness of their voices reassured him. When they sounded like this, it meant they were working, and working meant things were going right.

The gravity of the asteroid was hardly more than a suggestion. A strong jump would have been enough for them to part company with it for longer than their air supplies would last, so they moved slowly. The suits all had compressed gas thrusters, but they’d learned not to rely on them.

Darius’ first priority was the ice. If the asteroid itself had ore worth hauling, that would be good, rationally speaking. But there was something in the back of Darius’ mind that made scraping a little ice off the surface of an asteroid under quarantine feel less dangerous than collecting ore. As if one substance was somehow morally different from another.

“It’s not bad,” Lester said. “But it’s not dense either.”

They were a few hundred meters from the Cassandra where Amy had brought it to rest. With the sun hidden by the asteroid, it was as dark here as in the depths of space beyond Neptune. Darius played his worklight over the pale crust around them.

"It's castoff," Darius said. "All of this around here. The formations over the horizon might have been here naturally, but this is all either steam from drives or native ice that was heated to steam, cooled, and recollected here.

"It's clean, anyway," Lester said. "We can use it. Fill the tanks and more with all this to work from."

"Coyos?" Abril said in Darius' ear though she was nowhere in sight. There was something in her voice that dropped adrenaline into his blood.

"We're here," Darius said. "Where are you?"

In response, Abril turned on her locator. The cheap heads-up display in Darius' suit pointed him to the far side of the ship and down into a split in the stone body of the asteroid. Long streaks in the frost-like ice showed where Abril had gone. Darius gave in to fear and used his suit's thrusters, driving himself deeper into the fissure. Lester flew at his side, a little slower.

"Abril?" Darius said. "Tell me you're alright?"

"Bist bien," she said, but her voice had a strange tone. Like she was looking at a puzzle she didn't know how to solve.

The fissure bit deeper into the stone than he had expected. The rough sides spoke to a natural formation. Mining would have been smoother and more controlled. Ahead of him and below, Abril's work light glimmered.

And something ahead of her glimmered back.

At the bottom of the fissure was an airlock. The outer doors were half open. The steel frame set into the natural, unworked stone was polished and smooth. Only a thin layer of dust served to dim its mirror finish. Darius braked hard, the jet of nitrogen kicking up fines and dust and tiny crystals of ice like fog rising from a river.

"Lester?" Darius said. "What am I looking at?"

"No idea," Lester said.

Slowly, Abril moved forward, her work light shining into the lock. The inner doors were open too. Darius scanned infrared, but nothing rose above the ambient cold of the stone. Whatever this place had been, someone had vented it intentionally, and a long time ago.

“We sure this is a good idea?” Darius said on the open channel.

“Are we sure what is?” Amy said from the ship, but Abril had already moved inside the lock.

Darius and Lester exchanged a look. “One of us should stay outside,” Lester said. “Just in case.”

Darius lifted a hand in agreement and moved forward. In the microgravity, he had the uncanny sensation that he was falling down into the airlock like it was a pit. Or a grave. Inside, Abril’s worklight was playing over a wide chamber. The walls had been insulated once, but the foam had broken down over time, leaving long strips that had drifted to the floor. The bare stone was polished and worked. The fissure that led here might have been natural, but the chamber had been created. Abril pulled herself along the wall, and Darius followed, his thrusters off to keep from stirring up more dust. His breath sounded unnaturally loud in his ears.

“Ah,” Abril said. “Vise la.”

“I am looking.”

“No,” Abril said, pointing forward. “La.”

Thirteen figures were sitting in a semicircle, legs folded beneath them. Their vac suits were all a dusty red color, plasticized fabric that had broken down over decades. The helmets were swept back and weirdly aerodynamic, like something out of a history book on the first days of terraforming. All of them had holstered side arms at their hips and military insignia that Darius didn’t recognize. For a few long breaths, he thought the suits were empty, but then his light passed over a faceplate, and the corpse inside it stared out. Gray, desiccated flesh. Sunken, empty eyes. Everything that made a human except for water and life. Abril moved forward slowly, letting

her feet drift down to the chamber floor. There were nameplates on the suits. Hoffmann. Gutierrez. Dahl. And ten more beyond them. The ancient dead.

“What the hell is this?” Darius said, as much to himself as to anyone.

Abril agreed with a hand gesture, then looking up, said, “Y que es la?”

Her work light angled up. There, suspended from the wall, was a thick rectangle of dark ceramic. An ancient storage container. The circle and arrow symbol for masculinity stood out in silver and blue, and what looked like three ideograms in a form Darius didn't know. A seam ran around its edge, making it seem like a great, still sarcophagus.

The semicircle of the dead faced it, as if the end had caught them all in a final and terrible act of worship.

* * * * *

“Ah. Well. Could be a number of things,” Lester said.

They were back in the Cassandra. All four of them in the galley again. The three of them who'd gone outside were still wearing their vac suits, and it made the space feel smaller. Tighter. The dust of Xi-Mallow they'd tracked inside smelled like gunpowder. Darius almost never felt the claustrophobic sense of being buried alive that he'd suffered when they first started flying, but it was tickling at him now.

“A number of things,” Amy echoed. It came across as scepticism, but Darius has known her long enough to tell it was only not knowing what else could be said.

“Yes,” Lester said. “Could be a religious cult. There were several of those on Mars in the early days. Or this could have been a secret research facility. Mars was all about that back in the day.” Then a moment later, “Still is, probably.”

“If it's Martian,” Amy said, “why's this place under UNN quarantine?”

“When was the Epstein Drive invented?” Darius said. “Did those people in there... Did they get here in a flying teakettle? Old chemical rockets, maybe? And what killed them? I mean, they were there to die. You saw how the lock was forced. They were all in suits, and they just sat there and died.”

Abril waved a hand like she was shooing away all the questions. “Ab que im eske, sa sa?” But what’s in it? She meant the black storage container.

“It has a label on it,” Lester said. “The Mars sign, and the writing.”

“Mars sign?” Darius asked.

“The circle and arrow. It’s an old symbol for Mars.”

“Thought it was the old symbol for the pisser you could use standing up,” Amy said, but the joke had an overheated quality. Like there was fear behind it.

Lester nodded, and Darius didn’t see fear in him, but a growing curiosity. “And the ideograms... there was a lot of Chinese influence on Mars at the beginning.”

“And these are the traditional Chinese families of Dahl and Hoffmann?” Darius said.

Lester looked hurt. “I didn’t say I knew what it was. I said it could be a number of things. But it doesn’t matter what it was then. Not really. The point is what it is now. And we do know that.” He looked around at them all solemnly. “That thing is our ticket out. We know that, right? Whatever that thing is, it’s immediately convertible to money. We put it in the hold, haul it back to Luna. A few words in the right ears, and we’ll have buyers lining up. We might even get a bidding war.”

Darius knew this was coming, and even so it shocked him a little to hear it said out loud. That he already had arguments for and against the plan—What if it’s a nuke? It’s been stable here for over a century. We don’t have to open it. —told him how much he’d already been thinking about it. About saving the Cassandra. His inheritance from

his parents. The path he'd chosen. After all, they'd come here trying to get enough water for one more run. This was that hopeful impulse answered a thousandfold. If they left it here...

With the ship laid down against the stone, microgravity pulled him gently toward the wall. The others all looked at him like they were expecting a pronouncement. He pulled up the ship's stats. Since they'd made contact, the Cassandra had dumped so much waste heat into the asteroid that life support was adding heat to the living space now. If he listened, he could hear the ship ticking to itself as it cooled and contracted. He loved the ship, and he loved the people on it. He felt the weight of his dreams and aspirations on his shoulders, stronger than the actual pull of gravity.

He took Amy's hand, running his thumb along her scars by long, affectionate habit. "Get the drive up. And a path to Luna."

"Yes!" Lester said. "I'll slap together a loading mech and have that thing out in—"

"Anybody who leaves the ship stays here," Darius said. "We're getting out now."

Lester sputtered. "But... I mean, the water—"

"Fuck the water," Darius said. "Get us a path to Luna. As soon as we're clear of this place, I'll put in for a berth and an indigence auction. Whatever we get, we split four ways."

Amy squeezed his fingers. "Babe, are you sure?"

"We can get work on Luna," he said. "Maybe we can crew up on some other ship. Find a captain who knows what they're doing, maybe."

He tried out a smile, and the power behind it wasn't sorrow. Or at least it wasn't only sorrow.

"Dar," Lester said, cajoling.

"You want to come back here, Lester," Darius said, "I can't stop you. But the answer now is no. Everyone go make ready. I want to get out

of here in the next two hours.”

There was a moment of silence in the galley while the others caught up to where Darius already was. Abril lifted an acknowledging hand and Lester nodded. They pulled themselves out of the galley, and a moment later, he heard the unmistakable sounds of them pulling off and stowing their vac suits. He was still holding Amy's hand. He looked into her eyes. He'd been afraid to see tears in them, but they were dry. After a moment, she squeezed his fingers again, and hauled herself toward the flight deck. Darius took a silent moment alone in the galley.

He didn't know what would come next. How he would make his living once the Cassandra was gone. Lester and Abril with it. Probably he'd still be with Amy, but that was her choice to make, and he was never perfectly sure. But whatever it was, it wouldn't be what it could have been if he'd made the other decision. His life was defined by all the paths he didn't take.

And the mistakes he avoided.

COREY**

AUBERON

AN **EXPANSE** NOVELLA

Auberon is one of the first and most important colony worlds in humanity's reach, and the new conquering faction has come to claim it. Governor Rittenaur has come to bring civilization and order to the far outpost and guarantee the wealth and power of the Empire.

But *Auberon* already has its own history, a complex culture, and a criminal kingpin named Erich with very different plans. In a world of deceit, violence, and corruption, the greatest danger Rittenaur faces is love.

AUBERON

The old man leaned back in his chair, ran his tongue over his teeth, then lit a fresh cigar. His left arm was a titanium and carbon-fiber prosthetic grafted deep into the bones of his shoulder, but his natural right arm was just as intimidating: scarred and pocked by decades of violence and abuse. His hair was a fluffy white fringe that cupped the back of his skull, and he wore a thin mustache like it was a joke he was in on.

“All right. So we’ll get a new governor who answers to a different boss,” he said. “It happens. Everyone’s playing by the rules, and then something rolls through and changes them all. Things get scrambled for a while until everyone figures the new rules out.”

His second went by Agnete because it wasn’t her name. She didn’t roll her eyes. She was used to the old man getting poetic, especially when he was thinking something through. The fingers of his metal arm shifted unconsciously, the wrist curling in on itself the way the real one had, back in the day.

The office wasn’t really an office at all. At the old man’s level, business could be done anywhere, and he liked the little bar on the Zilver Straat plaza with its wide-bladed ceiling fan and the smells of salt and sulfur coming off the bay. He claimed it reminded him of the kinds of holes and corners he’d grown up in, back on Earth. Some days, people came to meet him there. Occasionally, he’d go out and sit with people in other parts of the city. Someone powerful needed a loan and couldn’t get one. Someone

needed a supply of agricultural chemicals or drugs, pornography or off-book sex workers, untraceable security teams or zero-day code exploits, then sooner or later they came to the old man.

“The thing is,” he said, “you only have so long to figure out the new rules. That’s what kills you. You’ve got to look at the situation like you’re just coming into it, because you are. And sure, maybe it’s got the same street and the same people. That doesn’t mean it’s the same place. All the things you just take for granted about how it works are up for grabs again, and—”

“Permission?”

He scowled, but he nodded her on.

“Boss,” she said, “we didn’t just get a new governor. We got *conquered*.”

The old man grunted dismissively. He didn’t like being interrupted. Agnete nodded toward the wallscreen behind the bar. The newsfeed from Sol had the secretary-general of Earth, the speaker for the Martian parliament, and the president of the Transport Union—the most powerful people among all the scattered human billions—being humiliated and brought to heel by the new order like the burghers of some half-razed medieval town. The combined fleet was in tatters. The void cities broken or occupied. Pallas Station was reduced to pebbles and hot gas. Medina, at the heart of the gate network, taken over by the half-alien ships that had boiled out of Laconia system. The whole human orthodoxy overturned in what felt like a moment. High Consul Winston Duarte had named himself ruler of all humanity and had killed enough people to make it true. Emperor of the galaxy.

“This time is different,” she said.

The old man spat smoke and grunted again.

* * *

The gate network had opened more than thirteen hundred solar systems to humanity, almost all of them with one or two or three planets in the Goldilocks zone. Under hundreds of suns, evolution had improvised new

answers to the overwhelming question, *What is life?* With carbon and nitrogen, hydrogen and sunlight and time, the possibilities weren't limitless, but they were mind-boggling. The DNA and asymmetric chirality of organic life on Earth and its Sol system colonies turned out to be idiosyncratic in a wide and creative universe. Even animals shaped by the same selective pressures to look similar to Terran life—the grass trees of Bara Gaon, the humpbacked pigeons of Nova Brasil, the skinfish of New Eden—only needed a glimpse under a microscope to show they were as different from their Terran counterparts as a bull from a bicycle.

A human being could eat all day and still starve to death in the great garden of Sigurtá, surrounded by bright fruits and soft vegetables, trees heavy with fat birds and rivers filled from bank to bank with things that almost passed for trout.

The forest of life was varied and exotic, and the trees there didn't get along with each other. Or most of them didn't anyway.

At first glance, Auberon system didn't seem exceptional. Three modest gas giants, none of them larger than Saturn. A single wet, life-bearing planet with a large but unexceptional moon. There were no alien artifacts the way there had been in Newhome and Corazón Sagrado. No weirdly pure ore profiles like on Ilus or Persephone. Just a scattered handful of planets, a couple of asteroid belts, and a star burning its slow way toward a billion-year-distant collapse. Among the hundreds of systems to which humanity was heir, it could have been anyplace.

But it was now the most important human system outside of Earth, Laconia, and maybe Bara Gaon Complex. Only a few decades into its settlement, and it already boasted a dozen cities, each of them in the middle of built-up rural areas like the floral disc in the center of a daisy. There were six dwarf planets with mining and refining developments big enough to have permanent civilian populations growing around them. There was a transfer station built to accommodate the trade between it and the other, less fortunate colony worlds. It was the second most developed human settlement in the universe, and on track to keep growing for centuries. And the thing that made its first settlers the winners of history's land-rush lottery

was that, apart from competing for sunlight, the biosphere of Auberon barely interacted with the plants and animals of Earth.

There was a famous image of an Earth apple tree and an Auberon-native tree, their roots intertwined as if each were acting as soil for the other. That mutual biochemical shrug made open-air farming possible on Auberon. Contamination by local organisms tended not to mean more than a mild case of gas. And because it was the most habitable of the new planets by orders of magnitude, it was developed. Because it was developed, it was influential. Because it was influential, it was wealthy. And because it was wealthy, it was corrupt.

And now, it was Biryar Rittenaur's problem.

A woman's face appeared on his handheld. She had a prominent chin, long white hair in tight curls, and a high forehead... Biryar tapped his fingers against his thigh. He should know this one. A face like a spade. A spade is a garden shovel. Shovel...

"Michelle Cheval," he said. "President of the Agricultural and Food Production Workers Union."

The handheld shifted to a young man's face. Pleasant, neutral, with a mole at the side of his mouth that reminded Biryar of a cartoon rabbit. That was the image he'd built—cartoon rabbit with a basketball. He knew it was the right image, but he couldn't make the jump to why he'd chosen it.

"Damn it," he said, and tapped the man's profile. His name was Augustin Balecheck. He was the deputy minister in charge of planetary transportation security. Mona leaned over his chair, resting her chin on Biryar's shoulder.

"What was this one?" she asked. He could smell the almonds on his wife's breath and feel the shifting of her jaw against his as she chewed. It was the third year of their marriage, and he had never stopped loving the smell of her skin close to his.

"A rabbit basketball player," he said. "The mole was like a rabbit whisker. Balecheck like 'ball check.' Also traveling is a foul in basketball, and he's planetary transportation."

Her sigh meant she was thinking. She pointed a thin, graceful finger at Deputy Minister Balecheck's mole. "He got that because the guy he was

deep-throating had paving tar on his scrotum.”

Biryar coughed out something close to a laugh.

“That man’s cheek is a ball check,” she said, “and the paving tar will remind you of the road system.”

“Good lord. Are you always this obscene, Dr. Rittenaur? I’m not going to shake the man’s hand while I imagine him having sex.”

“If you don’t like it, erase it from your memory and go back to the cartoon rabbit thing,” she said.

“I don’t think I’ll be able to now.”

She tapped her forehead with the tip of her finger, and she grinned. “Which is my point. It works better if you commit to the process,” she said. Then she kissed his ear.

Biryar had two hundred and eighteen individuals and fifty-three organizations to commit to memory. More than any literal cartography, it was the map of the territory he was going to have to travel as the first Laconian governor of Auberon.

He hadn’t been surprised when Duarte had chosen him. He’d worked for the empire since he was old enough to enter government service, excelled in his coursework, taken every initiative to rise among his peers. He had done his thesis on High Consul Duarte’s early philosophical works and their relationship to examinations of grand strategy throughout human history. Auberon hadn’t been a specific ambition of his, but a posting of importance to the empire had been. Medina or Bara Gaon or Sol, a position in the High Consul’s cabinet or teaching at the university on Laconia would have served his hopes as well.

The reason, he knew, that he was in the cramped military cabin en route to a governor’s mansion was Mona. Her small, round face and wide, dark eyes made her seem younger than she was and somehow elfin, but his wife was the best soils scientist of her generation. While he had been writing an academic love letter to the most powerful man in the empire, she had been mapping out paths to bring the thousand different biospheres into accord, to engineer everywhere what Auberon had happened onto by chance.

Before she’d taken a single step under Auberon’s sun or drawn a breath of its air, Mona understood the richness of its dirt, and the potential that

rested there. Her post would be at the Xi-Tamyran Agricultural Concern in the capital city of Barradan, where the governor's office would be. Their skills and backgrounds were perfectly suited for the post. He could only hope that the millions of inhabitants of Auberon saw that too.

He switched to the next image. A hard-faced woman with dark-brown eyes. He didn't need a mnemonic device for her. Suyet Klinger was the Auberon representative of the Association of Worlds, and one of the only people he would be ruling over that he'd actually met. He tapped to move to the next image but the screen shifted on its own and a scheduled request took its place. He let a breath out between his teeth and rose from his crash couch. Mona popped another almond into her mouth and watched him walk the few steps to the cabin door.

"I'll be back," he said. She nodded, and didn't speak.

They were already in their braking burn, the floor of the *Notus* pushing up against them at almost half a g. It was a short walk to the meeting room where the head of his security, newly assigned from Medina Station and picked up on the way through the gate hub, was waiting for him. The relief Biryar felt at putting aside the memorization work was evidence that greater discipline was called for. He made a mental note to go back to it as soon as the meeting was done. Not because he wanted to, but because he didn't. And it was his duty.

Major Overstreet was a thickly muscled man with pale skin and bright-blue eyes that left him seeming eerily corpse-like. He'd served with honor and distinction most recently under Colonel Tanaka and then Governor Singh of Medina Station. And when Medina had faced its crisis, Major Overstreet had stepped in to prevent atrocities being carried out in the name of the empire. He was a hero, and to be honored. But when Biryar sat across from him, the back of his neck itched a little and felt the shadow of the guillotine.

"Governor Rittenaur," Overstreet said, rising to his feet and saluting. "Thank you for your time."

"Of course, Major. Thank you for your work." Their usual pleasantries. There was neither warmth nor animosity behind them. They were two

people entirely defined by their formal relationship: fellow cogs in the machine to which they were committed. It was comfortable.

“I’ve reviewed the report from the Association of Worlds,” Overstreet said. “There are some decisions that need to be made about your accommodations, and it would be useful to me to have some guidelines about your risk tolerance.”

“What are we looking at?”

Overstreet pulled up a report and sent it to the wallscreen. The format was familiar. Biryar had been reading and interpreting security reports for years, and usually for places he’d never physically been. He took in the slopes of Barradan’s hills and the curve of its roads from a scattering of lines. The compounds that had been offered to him were marked in Laconian blue. He touched the northernmost.

“This has the fewest angles of approach,” Biryar said. “That’s a fence?”

“Decorative fence on a half-meter wall. Easy to reinforce. But it’s also the farthest from the Xi-Tamyan campus, here,” Overstreet said, indicating the far side of the city. “Which means the most exposure in transit for Dr. Rittenaur.”

Biryar leaned forward, considering the other options for his new home in this new light. “What about this one?”

“Open grounds—like most places in Barradan—and approachable from three directions. But we can build a wall, the structures are defensible, and it would minimize daily transit exposure.”

The potential for separatist violence had been proven on Medina and in a handful of the colony worlds. The enemies of Laconia and the High Consul were out there, and some would be on Auberon. In Barradan. Some would pass him in the streets, and he might not know them.

And they would pass Mona as well.

“The one closest to Xi-Tamyan will do,” he said, and as soon as he said it, he felt a rightness in the choice. “And there’s no need to build any walls. Let’s not establish our new administration by hiding in our shell like a turtle. Personnel and active security show more engagement and openness.”

“Yes, Governor,” Overstreet said with a bland smile as he collapsed the reports.

The real protection wouldn't be walls and fences. It would be the narrative of power. The *Tempest* in Sol system was a massive deterrent, even though it was very far away. The *Notus* was smaller, but close by, and Auberon system didn't have the military power to deny it.

"There will be a reception after we arrive," Overstreet said. "I'm coordinating with the local authorities."

"If you are satisfied with the security arrangements, please move forward," Biryar said, agreeing. "I trust your judgment."

It occurred to Biryar then that he'd just chosen the home he might spend the rest of his life in based wholly on its abstract qualities, without knowing the color of the walls or the shapes of the windows. If he had, it wouldn't have changed anything.

The *Notus* was rated for atmosphere, so there was no reason to dock at the lunar station. There was a landing complex just east of the city designed to withstand the ship's drive plume until they switched to maneuvering thrusters and settled to the ground. With the turbulence of atmospheric passage and the vibration of the drive gone, there was nothing to drown out the soft ticking of the hull plates as they cooled. Biryar let the crash couch hold him up. The gravity of his new home planet pulled him gently into its cool blue gel.

He had imagined this moment a thousand times. His arrival at his new post, and the heroic, grave impression he wanted to give to the people who were now under his control. It was important that they should see him as something near the platonic ideal of a wise governor—stern, merciful, wise. And he also wanted them to recognize his loyalty to the High Consul and Laconia, as a model for them. As an example to be followed.

Now that the occasion was actually upon him, he was mostly aware of just how badly he needed to visit the head.

He heard his cabin door open, and then the soft padding of feet on the deck. Mona smiled down at him. She had her formal dress folded over her arm, ready to be put on. It was high-waisted and high-collared with layers of lace in Laconian blue. She was dressing for this moment not in her role as soil scientist but as the spouse of a governor. Her eyes betrayed only a

little of her tiredness and anxiety. To anyone who didn't know her, not even that.

"Ready?" she asked.

Are you ready to take control of a planet? Are you ready to command the lives of millions of people and forge the most valuable planet in the greater human sphere into a tool that will, in time, feed trillions of people under a thousand different suns? He told himself that the flutter he felt in his stomach was excitement. Not fear. Never dismay.

If she had been anyone else in all of humanity, he would have said *Yes, I am*. But it was Mona, and so his true feelings were safe.

"I don't know."

She kissed him, and the softness of her lips and the strength of them were a comfort and a promise. He felt his body starting to react to her and stepped back. Distracted and aroused was no way to start his tenure as governor. The millimeter lift of her eyebrows meant she understood everything he hadn't said.

"I'm just going over to my cabin to change," she said.

"That sounds wise."

She took his hand, squeezed it. "We're going to be fine," she said.

Less than an hour later, he walked down the gantry and stepped for the first time onto the planet. *His planet*.

From sunrise to sunset lasted a little over four standard hours on Auberon, with cycles of light and darkness changing only slightly with the seasons. By local convention, day was two cycles of light and one of darkness, night the reverse. Noontime on Auberon was always dark, and midnight was bright. It was midmorning, but it looked like sunset. Red clouds high above them, and huge sessile organisms like trees or massive fungi lifted red streamers as if all the world were touched by fire.

The small group that had been invited to greet him was by definition the most honored citizens of Auberon. The order in which he acknowledged them was important. The formality with which he held himself, whether he smiled or didn't when he shook their hands. Everything mattered deeply, because what High Consul Duarte was to the empire, Biryar Rittenaur was to Auberon. Beginning now.

The streets of Barradan were narrower than the broad boulevards of Laconia, with buildings that crowded the pavement. Brick the gray-green color of the local clay. The lights all glowed with the full spectrum of sunlight to say that this darkness was daytime, and would become dimmer and warmer when consensus night came. Security forces with rifles and riot gear kept his path clear as he moved through the maze of intersections. If someone had planned the city, they'd done it with the aesthetics of an earthbound ghetto. More likely, Barradan had bloomed with no intention beyond satisfying the needs of the moment.

Biryar traveled in an open car, the wind of his passage stirring his hair. Something smelled foul. Like a sewer that had failed. Mona wrinkled her nose at it too.

"Indole," she said. She saw the blankness of his response. "Technically 2,3-benzopyrrole. Just a couple carbon rings and some nitrogen. The local biome really likes it. Nothing to worry about."

"It smells like..."

"Shit. Yes, it does," Mona said. "The soils team tells me we'll get used to it in a couple days."

"Well. Elements are elements, and there's only so many things you can make with them, I suppose," he said. "Some smell better than others."

The compound was lit for noon when they pulled in. The house was shaped like a horseshoe, with pink stucco walls and polished metal sconces every few meters. Local insect analogs swarmed around the brightness. The courtyard in the center was paved in plates of carbon-silicate lace engineered to shine blue as a beetle's carapace. Starlight seemed to swim in its depths, reflections of the galactic disk overhead. The capital city of his planet didn't yet generate enough light pollution to drown the sky. The stars were the only things that reminded him of Laconia.

His personal staff stood at attention beside the building's wide central doors. Laconian guards and local administrators, all in formal dress, all waiting for Major Overstreet's inspection before they met their new master.

He was home now. For better or worse, this was his place in the universe, and might be for the rest of his career. Mona's sigh was barely audible, and he thought there was regret in it until she spoke.

“It’s beautiful,” she said.

* * *

The reception began a few hours later. The sun was directly overhead in the second of the day’s two brightnesses, and Biryar kept reflexively thinking of it as midday. He was impressed by the heat of the sunlight and the humidity of the air. Either the sewer stench had gone down with the rising sun or he was already growing used to it.

There were easily a hundred guests at the reception. Many of them were on the lists he’d committed to memory, but there were some others: a thin-faced woman with her hair in an elaborate plait, an older man with a thin mustache and a prosthetic arm, an agender person with a pinstriped linen suit and the studied respectability of a banker. Today was Auberon’s first glimpse of what Laconian rule would mean, and the people—city, planet, and system—were driven by their uncertainty and their fear. It was Biryar’s duty to project calm and strength, the implacable authority of the new regime, and its geniality and benignity to those who gave it their undivided loyalty.

He’d intended to wear a jacket, but he gave up the idea. He was happy to see that the guests had also chosen lighter shirts and soft, airy blouses. Mona’s blue lace looked almost heavy by comparison, but she wore it with grace. She moved through the party as assured and confident as if they had lived in these rooms for years, not hours. She laughed easily and listened intently as she spoke to the man with the prosthetic arm. He felt the twinge of jealousy in his breast as a mixture of admiration, love, and exhaustion.

As he moved among the guests, he found himself orbiting her. Touching her arm as they passed, laying claim to her the same way he was laying claim to the world. The glitter of amusement in her eyes, invisible to anyone but him, meant she saw what he was doing, and that she forgave him his weakness. Or that she enjoyed the power she had over him. They were two ways to say the same thing.

The first sign of trouble seemed so trivial that he didn’t see its significance at all at the time. They were in a side garden where the local

plants pushed their ruddy way up from a lawn of grass. A fig tree from Earth had spread its limbs above a small carved-stone table. The fruit was ripe to splitting, and added a sweetness to the foul air.

Mona was sitting across from a woman maybe twenty years older than either of them. The woman's graying hair was starting to escape an austere bun, and her cheeks were flushed from one drink too many. When he saw Mona's frown, Biryar stepped lightly over, ready to act as his wife's savior. He found he had misread the situation.

"We were so close," the older woman said. "Six more months, and we could have cracked it. I swear to fucking God."

Mona shook her head in sympathetic outrage. The older woman looked up at Biryar, a flash of annoyance at his interruption melting into embarrassment when she recognized him.

Mona took his hand. "Dear, this is Dr. Carmichael. I told you about her work on amino acid array translation."

Biryar smiled and nodded as his mind churned. Carmichael. What was array translation? He'd known this one... He found it. "Coaxing the local biology into growing something that can nourish us."

Carmichael nodded a little too strongly. A lock of her hair escaped unnoticed and fanned out behind her head as if she were on the float. When she spoke, her voice was reedy, caught in the uncertain space between anger and whining. "My funding was reallocated. They just took it away. I wouldn't pay the bribes, and so they said I was difficult to work with!"

"That sounds distressing," Biryar said, putting sympathy in his tone while keeping it out of his word choice.

"It was," Carmichael said, nodding. Tears brightened her eyes. "It was really distressing. That's exactly the word."

Biryar nodded back, mirroring her.

"I will absolutely look into this," Mona said.

"Thank you, Dr. Rittenaur," Carmichael said, still nodding. "We were so close. I can show you the data."

Biryar smiled down at Mona. "If that could wait until another time, there's someone I'd like you to meet, dear."

“Of course,” Mona said, rising. She and Carmichael exchanged farewells, and Biryar steered her away into the house without any clear idea where he was going except out of the older woman’s sight.

“It’s early to be taking sides in local disputes, don’t you think?” he said as they walked.

Mona looked at him. She was tired too. Overstimulated and out of her element just as much as he was. When she spoke, she snapped.

“Her work is exactly what Auberon should be focused on. If she got sidelined because she wouldn’t pay a bribe—”

“Corruption is a problem here. We knew that, and we’ll address it. Maybe this is an example, or maybe she just has a story that makes her feel better. Either way, please don’t commit us to anything on the first day.” It came out harder than he’d meant it. Worse, it came out patronizing.

Mona’s smile was warm and inauthentic, intended for onlookers and not for him. She squeezed his arm gently, bowed her head, and disengaged. He felt a little stab of distress. They should have put off the reception until they were both more rested. This was the kind of fight they only had when they were tired or hungry. They’d finish it in private if they had to. He didn’t think it would amount to more than that.

Still, he regretted it.

The reception carried on through the remaining two hours of daylight and into the second sunset of the day. The light grew redder, and the crowd of people began to thin. Biryar went over his mental list of people he thought it was important to acknowledge. Arran Glust-Hart, the forensic accountant with the Association of Worlds. Nayad Li, the director of planetary logistics. Devi Ortiz, the minister of education. A dozen more. As the evening drew to its close, the irrational fear of introducing himself twice to the same person started to grow. He hadn’t accomplished everything he’d hoped with the reception, but he knew himself well enough to recognize the point of diminishing returns. He remembered one of the High Consul’s sayings: Overdoing is also falling short. Better to have a good night end well than push for perfect and undo what had been achieved.

He’d woken on a ship under burn. He would sleep at the bottom of a gravity well. The thought was enough to make his limbs feel heavy. A glass

of whiskey, maybe. A boiled egg with some pepper and salt. And sleep.

He didn't notice quite how he found himself in the little drawing room that looked out over the courtyard. It was a cozy space with a tall, thin window and chairs made of some thick, fibrous wood strung with raw silk. The floor was made with the same green-gray bricks he'd seen on the drive in. A knotwork carpet commanded the center of the room. The older man with the prosthetic arm stood at the window, looking east toward where the sky was just fading from black to charcoal with the coming of the nighttime dawn, which put the hour near ten o'clock.

Biryar was certain the man hadn't been in his briefings list. The arm—titanium fused to his living flesh—would have been hard to forget. But even without that, the face was striking. The man's skin was pale and papery without seeming frail. Only well lived-in. A line of fluffy white hair ran from ear to nape to ear, leaving a wide, smooth scalp. A thin, white mustache. He wore tight black trousers and a pale shirt with an open collar. An unlit cigar was clamped in his lips. The one-armed man turned and nodded to Biryar as if he'd been expected.

"Turd of a planet," he said. "It's home, though. I remember the first time I came down. I thought I was gonna puke, it smelled so bad." He lifted his cigar between a thumb and finger. "It's when I started with these. Just to kill off my sense of smell. But I do love it now."

"I'm looking forward to making it my home too," Biryar said. "I don't believe we've been introduced."

"Makes me think of the Raj," the one-armed man said, as if he hadn't heard Biryar. "That was a weird thing, wasn't it? Dinky-ass little Britain using maybe a hundred thousand people to keep their boots on three hundred million necks? You can have the best guns ever, and those odds still suck. No, I do not envy you. Not even a little bit."

Biryar's smile went slightly tighter. Something about the moment felt off. "I think your understanding of history leaves something to be desired."

The man turned, pale eyebrows lifted. He shrugged his real shoulder. "Maybe that part. There's other bits of history I know better. You ever hear the question 'Silver or lead?' "

Biryar shook his head. “I don’t believe so. What’s your name? Who are you with?”

“My friends call me Erich,” the one-armed man said, grinning. His teeth were the color of old ivory. “So anyway, there was this thing way back when. They used to have these huge recreational drug companies. Totally illegal. And when someone new would come into town or get elected or whatever, the question was: silver or lead? *Plata o plomo*. Does the new sheriff in town take a bribe or a bullet? Hell of a slogan. It’s simple, you know? Boils everything down. You have to admire that.”

Biryar’s exhaustion fell away. His heart began to tap at his ribs, but he didn’t feel panicked. His mind was cold and sharp, and he was suddenly very present. “Are you threatening me?”

“What? Jesus, no. We’re just a couple guys talking history.” The old man took something from his pocket. At first Biryar thought he was going to light his cigar, but instead the old man placed the little device on the windowsill with a percussive tap. He stepped back from it. A small black shape, curved along one side.

Biryar gestured to it with his chin, asking the question without speaking.

“It’s a token for the local exchange network,” the one-armed man said. “It’s tied to a private, anonymized account with about fifteen thousand new-francs in it. That’s enough to buy even someone like you a little privacy.”

“For what?”

The man spread his hands. “Whatever. I don’t judge.”

Biryar stepped carefully to the window and picked up the token. The resin looked like smoky glass. Obsidian. The old man smiled until Biryar dropped it to the floor, put his heel on it, and ground it against the brick. The one-armed man’s eyes narrowed. The facade of good humor was gone, and Biryar knew he was facing a predator.

“Are you sure about that?” the old man asked.

“Don’t make me raise my voice. This is my house. And there are a lot of armed people in the compound right now,” Biryar said.

The man smiled. “There are. And some of them are probably pretty loyal to you. Others, maybe not as much. You a gambling man?”

In the window, the night's single, swift dawn was already breaking. Blue sky and high, scudding clouds. The two men stood still as stone for three long breaths, then the old man turned to the door and walked out. Biryar felt the shout swelling in his chest. He didn't let it out.

He was shaking. Trembling. He picked up the token. The resin was cloudy with scratches now, but he didn't know whether he'd managed to break whatever mechanism it contained. He told himself that he would not leave the room until he could gather himself again into the man he was supposed to be. He wouldn't rush out into the reception looking panicked. But then he thought of Mona earlier in the night, listening intently to the one-armed man, and he couldn't wait any longer.

The one-armed man had vanished. Mona, sitting on a wide sofa with a gin and tonic in her hand, saw him and put her drink down. He hoped it was only the intimacy of their marriage that let her see his distress. When she came to him, he kissed her ear and whispered.

"Find our guards. The ones from the *Notus*, not the locals. Stay with them."

She pulled back, smiling like a mask. She spoke without moving her lips. "Are we in danger?"

"I don't know," he said. "I'll find out."

With Mona warned, he could move to offense. He summoned Major Overstreet to his private office. Sitting at the wide wooden table where he'd never sat before felt like being in a mousetrap.

Overstreet stepped into the room and stood at attention. The only sign of fatigue was a slight darkness in the skin under his eyes. "Sir?"

Biryar kept himself calm, or as calm as he could. When he got to the old man's threat, Overstreet became almost eerily still. When the full report was given, he put the token on the desk. Overstreet picked it up, considered it, and placed it back down. Biryar leaned forward in his chair. He hadn't said anything yet that the old man wouldn't have known from being present when it happened. That was about to change.

"How certain are you that our conversation here is private?" Biryar asked.

Overstreet hesitated. Then, “An hour ago, I would have said I was certain, sir.”

“Now?”

“I’m less certain.”

The silence had weight. “I think it would be very unfortunate to leave the compound so soon after arriving. I will visit the *Notus* in the morning to finish clearing the diplomatic documents. We can have a conversation there.”

“I will have Laconian guards stationed to assure your safety.”

“And Dr. Rittenaur’s.”

“Yes, sir. And I will begin an investigation as to who this individual was at once, and who allowed him on the property.”

“Thank you,” Biryar said. “This has to be our first priority now.”

“Agreed, sir. I’ll have a preliminary report ready before you reach the *Notus*. And...” Overstreet pressed his lips together and looked away.

“What’s bothering you, Major?”

“This was either an egregious failure on the part of the local forces or an outright subversion of security protocols. Either way, there will have to be consequences. Before I begin an investigation, it would be good to have some sense of how you would prefer to escalate this. Should that be needed.”

It was a measure of how much the encounter had shaken him that Biryar hadn’t considered this already. On Laconia, a breach of this magnitude would mean someone was executed at the least, and more likely sent to the Pens as a test subject. But on Laconia, a breach like this would never have happened. The first decision of his career would be whether to execute someone and very possibly alienate the planet he’d come to preside over. And the decision was complicated by what had happened with Governor Singh on Medina.

“We both understand the dangers of overreach,” Biryar said, speaking the words gently, as if they were sharp. “If the offending party is a native of Auberon, arrest them and turn them over to the local authorities. The processing of their case will need to be thoroughly and completely

monitored. We will respect the laws here to the degree that we safely can. I won't escalate until Auberon's legal system has the chance to do this well."

"And if the issue began with us?"

Biryar smiled. That was easier. "If a Laconian is responsible for breaking protocol and putting our administration at risk, either now or in the future, we will execute them publicly. Laconian standards are absolute."

"Understood, sir," Overstreet said, as if Biryar hadn't simply restated a policy that traced back over thousands of light-years to the desk of High Consul Winston Duarte himself. Overstreet hesitated, then: "One thing, sir? Until this is addressed, I'd be more comfortable if you carried a sidearm."

Biryar shook his head. "It will be seen as a sign of fear. I trust your security force to make it unnecessary."

"I appreciate your confidence, but I'm asking you to do it anyway," Overstreet said. "The man was in your house."

Biryar sighed, then nodded his agreement. Overstreet left.

Mona was sitting on the edge of the bed when he reached her. Worry etched lines around her mouth. Probably around his as well.

"What happened?" she said. "Is there a problem?"

"The criminal element of Auberon is concerned by our arrival. As they should be," he said. "There was a threat. We're looking into it."

She pulled her knees up, hugging them to her chest, and looked out toward the windows. She looked lost and small. She was right to feel that way. They were one ship full of people to command a system of millions.

Thick shutters were closed against the brightness of the too-fast sun and the heat and stench of the consensus midnight. A line of brightness showed the seam where they met. Biryar sat beside her. A dozen things came to mind that he might say to her. *This is our duty* or *Some pushback had to be expected* or *We will destroy them*.

He kissed her shoulder. "I won't let anyone hurt us."

* * *

Agnete scratched her chin to make it seem more like she was thinking and less like she was struggling to keep her temper. The old man sat at the

breakfast bar. His bathrobe was a gray that could have been any other color before it faded. His fake arm was going through its diagnostic reboot, shivering and twitching. The old man did it every day even though the documentation said it was a once-a-month thing. The speed and violence of the reboot sequence made her think of insects.

When her outrage had subsided enough that she could be polite, she said, "That was a move, boss. Not sure I would have done that."

"It was a risk," he said, dismissively.

But whatever his tone, he wasn't at the Zilver Straat bar. Just the fact that he'd started moving his meeting places said he was taking the situation seriously. She didn't know whether she felt worse because of the new level of threat or better because he knew it was a problem. Even if he wouldn't say it out loud.

They were sitting in an apartment over a noodle bar. It wasn't quite a bolt-hole, although the old man had a few of those around the city and around the planet, and probably some she didn't know about. The light of afternoon dawn slanted in the clerestory windows, tracking down the far wall quickly enough to follow it if she was patient. She wasn't.

The old man poured ouzo over ice with his real arm, the liquor going cloudy as it filled the glass.

"This new governor's going to fuck us up now, isn't he?" she asked.

The old man didn't answer at once. His fake arm was almost done with its reboot. He used it to pick up the glass, and it seemed all right. Steady. He sipped his drink. "He's going to have to try. That's his job. It's still our home pitch, though."

"How hard is this going to be?" she asked. Her irritation was already fading, and her mind was turning toward what needed to happen next. Planning for violence. When the old man spoke, his tone was lighter than she'd expected.

"I don't know. He's a tight-ass, this one. I mean, it seems like these Laconians all are. Not a big surprise. You take a bunch of Martian Congressional Republic fanatics and interbreed them for a few decades, it's not going to tend toward a greater mental flexibility. I've got a few ears in place. We'll see how he reacts."

“Electronic?”

“Nope. Just people who like gossip and drinking. They’ll do.” The old man ran a metal finger around the rim of his glass, his mouth pulled into something that was almost a smile. “This guy. He’s... *hungry*. I just don’t know what for yet.”

“Does it matter?”

He drank down the rest of the ouzo in a gulp. “Of course it matters. Hungry pays our bills.”

“No, I mean, why do we care what he wants or needs when we’re going to kill him? Sure, maybe he’d look the other way if we got him a lot of exotic talcum powder and a bottle of whiskey, but that’s not going to matter much when he’s dead.”

The old man shook his head slowly. “I’m not killing him. Not yet anyway. We start knocking off governors, maybe we get a little time to breathe before the next guy comes, but the next guy’s going to be even more of a shithead. Better if I figure this guy out.”

“Permission?” Agnete said.

The old man waved his metal hand in a slow circle, inviting her to speak her mind.

“You already made the call,” she said. “He joins up by taking the bribe, or he turns it down and we kill him. He turned it down, so now we kill him. Those are the rules.”

The old man scratched at his hairy, white chest. Outside the window, a local pigeon—six compound eyes and bat wings covered with feathery cilia—landed, chittered, and flew off again. The old man smiled after it as if the interruption had broken his train of thought. When he spoke, she knew it hadn’t, and that the conversation was over.

“The rules,” he said, “are what I say they are.”

* * *

Mona Rittenaur’s office was on the top floor of the northwest corner of the Xi-Tamyan building. It was twice as large as her cabin on the *Notus* had been, with intelligent glass from floor to ceiling that not only adjusted the

level of light as Auberon's sun sped across its wide blue sky, but corrected the color to give the landscape below her a sense of greater constancy. She knew from her briefing that the illusion was supposed to make the transition to Auberon's unfamiliar daily cycle easier, but after the first few days, she disabled the feature. She wanted to see the world around her as it was.

"Dr. Rittenaur?" a woman's voice said from the doorway, and then, belatedly, a soft knock. "You wanted to see me?"

Veronica Dietz was her liaison with the workgroups. Mona had been coming to the office for a week now, and apart from being the living symbol of how anxious Xi-Tamyan Agricultural Concern was to have a solid relationship with the new Laconian government, her role in the research had been nebulous.

She was ready to define it.

"Yes," Mona said, "I heard about some research on amino acid array translation. I'd like to see the records on that."

"I don't think it's a live workgroup," Veronica said. "We had some preliminary work a few years back, but the powers that be thought the microbiota compatibility work had more potential."

"I understand," Mona said with a smile. "Just bring me what you have on array translation. It doesn't need to be complete."

"You got it. Anything else?"

"Not for now," Mona said, and Veronica vanished back behind the door.

Dr. Carmichael's tipsy, weeping voice had stuck with Mona since the reception. Biryar was focused on the incident, the threat, whatever euphemism he and Overstreet were using for it. The criminals and terrorists who saw Laconia as something that could or ought to be resisted. That they'd made a threat on the same day the *Notus* arrived bothered her, but she couldn't do anything about it directly. This, she could.

The records appeared on her system a few minutes later with a tagged note from Veronica offering to bring in some tea and one of the apple pastries from the break room. Mona thanked her in text but turned the offer down. Veronica's job required that she be solicitous and friendly, but it didn't cost Mona anything to treat her nicely.

The records of Dr. Carmichael's work were preliminary, as Mona expected. They also weren't quite as impressive as she'd been led to believe. There was good, solid work in it, though. If it had been done on Laconia, Carmichael would have had more tools for the experiments. And she might still, if Mona pushed to have her transferred back home. It tickled her a little, the prospect of swooping in and rescuing a languishing career just because she could.

The microbiota compatibility workgroup that had been funded instead was headed by a broad-faced man with brown eyes and hair as thin as mist: Dr. Grover Balakrishnan, previously from Ganymede, one of the oldest and most respected agricultural centers in Sol system. His plan was essentially harnessing evolutionary pressure to develop soils that supported both Sol and Auberon trees of life. Start a few hundred samples of mixed microbes, then part out the most successful ones. Iterate a few dozen times, and let selective pressure do the work.

It was sloppy. And, to her eyes, less likely to get replicable results than Dr. Carmichael's work. That didn't mean that there had really been a conspiracy to quash the array translation project. It might just have been a bad decision. She went back to look at the funding committee reports. It took her most of the morning and well into the midday darkness before she found the smoking gun.

Deep in the patent payment agreement that covered any products derived from the microbiota compatibility studies, a new name appeared. Only it wasn't really new at all.

V. Dietz.

Veronica.

Mona went through all of the present workgroups, and again and again, all through the studies, it appeared. Whatever discoveries Xi-Tamyan made in their facilities on Auberon, Veronica Dietz was contractually entitled to a cut. Each one was small, but taken together, they would be enough to make her fantastically wealthy. People had been murdered for much less money than her liaison made in a month. And that was before her salary.

Mona went through again, this time looking for the justification for the payments. Some service that Veronica did for the researchers that made the

payments make sense. There was nothing apart from the inescapable conclusion that if anyone was going to make anything, Veronica Dietz got a slice.

When her system chimed, she flinched. Veronica's voice came from the speaker, as friendly and casual as ever. It was only the intensity with which Mona listened that made it seem fake as a carnival mask.

"Hey, Dr. Rittenaur. I'm heading down to the commissary. Do you want me to get you anything?"

The steadiness of Mona's voice surprised her. She would have thought that something would make it tremble: surprise, fear, anger. But she only said, "No, I'm fine," and let the connection drop.

* * *

Biryar had only ever been to two executions. The first time, he had been a child, and Laconia had still been more wilderness than civilization. One of the soldiers who had come with the first fleet had been careless in his driving. Maybe even intoxicated, it was hard to remember the details now. A boy from the original scientific expedition had been struck and killed. Duarte himself had overseen the punishment, and attendance at the death had been mandatory.

Before they killed the man, Duarte had explained that discipline was critical for them all. They were a small force in a single system, with no influx of immigration to draw from. It had seemed a strange argument at the time. If people were so rare and precious, killing one seemed wasteful.

Later he understood that the preciousness was what made the sacrifice profound. The soldier had died quickly, and while it didn't undo the man's crime, it showed the members of the civilian scientific expedition that Duarte and his followers valued their lives and the lives of their children. If the driver had lived, bringing the two populations together would have been difficult or impossible.

The second time, it had been a young construction worker in the capital who used the wrong proportions when mixing concrete for the foundations of one of the buildings. No one had died, but the error, if it hadn't been

found, could have led to hundreds of deaths when the structure collapsed. Duarte had held a ceremony—again mandatory—so that everyone could understand the severity of the problem and the sorrow with which the young woman was being sent to the Pens. Biryar hadn't watched her die, but he still remembered her tear-streaked face as she made her apology to the community.

Laconia had always been the few and the pure against the many and the corrupt. Like the Spartans from whom they took their name, Laconians were severe within their group, both to forge the iron discipline that had led them to victory and to demonstrate to others the sincerity of their beliefs.

It was hard, but it was necessary.

Now the Laconians present in the courtyard stood at attention, representing the empire and its uncompromising resolve. Biryar had his place of honor at the front of the assembly.

"I apologize," the prisoner said, "for the shame I brought on my companions. And for the wrong I have done to my commander and the High Consul."

The sunlight hurt Biryar's eyes, and a thin film of sweat stuck his shirt to his back. The pistol felt heavy, the holster like someone constantly tapping his hip for attention. There were more locals in attendance than he'd expected. Some were employees of the local newsfeeds, but many of them had come as sightseers and tourists drawn by the spectacle of punishment the way they would be to a sporting event.

The prisoner, an ensign assigned to logistics and supply, had given a pharmaceutical printer and two boxes of reagents from the *Notus's* medical supplies to a local criminal to produce untaxed recreational drugs. The local buyer was in an Auberon-administered prison and faced two years' confinement if she was convicted. The trial was apparently a lengthy process. The Laconian side of the theft would be dead before Biryar ate dinner.

The prisoner hung his head. A guard led him up the steps to the little platform. The prisoner knelt. Biryar's nose had grown mostly insensible to the sewer smell of Auberon, but a particularly strong whiff of it came on the breeze. It felt like a comment. Tradition, such as it was, allowed anyone

higher in the chain of command to give the order, but symbolically, Biryar knew it had to be him. The prisoner's commanding officer, a woman Biryar had known peripherally for almost a decade, stood on the platform with a sidearm at the ready.

Biryar stepped forward to the sound of a single, dry drum, met her gaze, and nodded. He half expected tears to glisten in her eyes, but her expression was blank. After a moment, she nodded in return, pivoted, and fired a single round into the back of the prisoner's head. The sound was weirdly flat. The drum stopped, and a medic came out to certify the death.

And it was over. Biryar turned to the cameras of the local newsfeeds, careful to present his better profile. The crowd looked shocked. That was good. State violence was meant to be shocking. It was done to prove a point, and it would have been a pity for the sacrifice not to have its effect. He paused long enough to be sure that they'd all gotten a good image of him for the feeds, then turned toward the Laconian contingent. He wanted to go back to his office, get a cold gin and tonic, and close his eyes until his head stopped aching.

Most of the people in Laconian blue had come with him on the *Notus*, but Suyet Klinger, the local representative of the Association of Worlds, and her staff had also chosen clothes that echoed Biryar's uniform. Blue almost the right shade and tailored in a similar cut. Not Laconian uniforms, but something that rhymed with them. Her face, as he stepped to her, was grave.

"I'm very sorry, sir," she said. "I'm sure that was very difficult for you."

He knew what he was supposed to say. *Discipline is the policy of the High Consul*. It should have been easy, but the words that came to his mind were *Why are you sure?*

Klinger knew nothing about him but what she'd been told by Laconia. She would have been just as solicitous to anyone who had come in his position. And if someone else had been in her role, he would have treated them the same way he did her. They weren't people to each other. They were roles. This was etiquette, and the inauthenticity of the situation oppressed him.

He nodded to her. "Discipline is the policy of the High Consul," he said, and she averted her gaze in respect. The forms were there to be followed.

He moved through the grim crowd, acknowledging each of them and being acknowledged. Form. It was all just keeping form. The shadows shifted around them as the sun raced for the horizon and left him feeling like he'd been there for hours, but there were more nods to exchange, more words to mouth. The dead man was hauled away to the recyclers, and the medics retreated.

It was strange and in a way unfair that the local thief would live and might even go free. Being Laconian meant being held to a higher standard, and so transgression against that standard required a higher response, but it still bothered him. Or at least it did for the moment. If he could get some rest and a decent meal, it might not. The faces in the group began to blend together, one following another following another until he didn't know or care who he was speaking to.

He came to a man he hadn't met in person before, with brown hair, a serious expression, and a mole on his cheek like a dot of paving tar. Biryar almost pulled away, shocked by the sudden visceral image of how the fleck of tar had gotten there, and then felt amused and even strangely pleased.

"Deputy Balecheck," Biryar said. "Good to finally meet you."

Balecheck's eyes widened a fraction. The surprise at being recognized melted quickly into a smile as they shook hands, and then Biryar moved on. From the other man's point of view, it had been a gratifying moment that showed his importance to the new governor. Functionally, it was an example of building the kind of good relations with the local authority that would cement Laconian rule on Auberon. It was also a smutty joke with his wife, but that was a fact Biryar would keep entirely private. At least until he was alone with Mona.

It works better when you commit to the process, she'd said. He had to commit to the process of governing Auberon, even the parts that he found difficult. Especially to those parts.

A car waited for him at the edge of the courtyard, ready to take him back to his offices. When he ducked into it, Major Overstreet followed and sat across from him. His pale, bald face shone with sweat.

"How are you doing, sir?"

"Fine," Biryar said. "A bit of a headache."

“The stutter,” Overstreet said.

“The what?”

The car pulled away, and cool air, as fresh as if it came from the *Notus*’s recyclers, touched his face and filled his nose. He noticed the absence of Auberon’s stench and dreaded the end of the ride when he’d step back into it. It made more sense to keep exposing himself to the foul air. Breaks from it like this could only prolong his acclimation.

“They call it the stutter, sir. It’s common among new arrivals. The four-hour cycles don’t sync well with normal circadian cues. Irritability, headache. Some people get vertigo after about a month that clears in a few days. It’s just our brains learning the new environment.”

“Good to know,” Biryar said. “Is it bothering you?”

“Yes, sir, it is,” Overstreet said. “I’m looking forward to it being over.”

The growing twilight in the streets was the real one. The end of the day and the beginning of evening. If he did it right, Biryar hoped to be asleep before the nighttime dawn. If he could just sleep through and give his body the impression of a full twelve hours of darkness... The longing for rest surprised him. Maybe he was more tired than he knew.

“What progress have you made on that other investigation?” Biryar asked.

“The man with the metal arm,” Overstreet said, making the words like the heading on a report. Neither a question nor a statement, but a tag that identified the content to follow. “He is a known figure in the local criminal demimonde. He goes by several names, but he has no entry in the law enforcement systems. He has no accounts on the exchanges, though given the token he tried to bribe you with, it’s safe to assume he has significant access to untraceable funds.”

“Where did he come from?”

“There aren’t any records of his arrival in the databases.”

“So he grew out of the dirt?” Biryar said, more sharply than he’d meant to.

Overstreet shrugged. “I’m moving forward with the assumption that the local databases are at least inaccurate and more likely suffering ongoing compromises.”

Biryar leaned back in the seat. A group of young men were playing football in the street, and the security detail was yelling at them to move off and let the cars through. Biryar watched them. Long-limbed, lanky young men. Maybe Belters. Maybe just adolescents. Any of them could be a separatist terrorist. All of them could be. For a moment, it felt like madness to be on the planetary surface at all. There was no safety here. There couldn't be.

"He's not a criminal mastermind," Overstreet said as the car started forward again. "He's just got a head start. We will track him down."

"Don't turn this one over to the local police. He should be our guest until we can fully understand how he got past our security arrangements."

"I understand," Overstreet said. "No formal arrest, then?"

"Once he's helped with our security review, we can revisit the issue," Biryar said. And then, a moment later, "He was talking with my wife."

"Yes, sir. I understand."

The compound was well guarded now. Laconian marines in powered armor stood like sentries at the approaches and on the roofs. He lost something by having them there. Duarte's rule through him should have been inevitable and confident. A standing guard made him seem concerned, and concern made him look weak, but he couldn't bring himself to dismiss them or release them to other duty.

As he stepped into the private rooms, he unbuttoned his collar. In the time since they'd arrived, Biryar had made some changes to the governor's compound. He hadn't brought many things from their old home on Laconia, but what there was had pride of place. The picture of Mona receiving her Laconian distinguished service award, framed on the front wall where the light caught it. The clay sculpture she'd given him as a wedding gift. A calligraphic print of one of High Consul Duarte's sayings—*Effort in Discipline. Effortless in Virtue*—in gold leaf.

Everything else in the rooms was foreign. The fluted wall sconces with different spectrums of light for daytime darkness and night. The grain of the false wood paneling, made from the treelike organisms of Auberon to mimic the trees of Earth. Neither one was his home. It felt like the room

itself was telling him that he didn't belong. Like it was pushing him away. He was sure that, with time, the sensation would pass.

He stretched. The knot between his shoulders appeared to be there permanently now, like the grit in his eyelids. The door behind him opened with a click, and Mona's footsteps—as familiar and unmistakable as her voice—followed. He looked over at her, and his heart sank to his gut.

“What's wrong?” he asked.

She dropped into a cushioned chair and shook her head. A small, tight, unconscious gesture he'd seen before. Anger, then. Well, better that than fear. He went to sit near her, but didn't touch her. Her rage didn't respond well to physical comfort.

“This place is rotten,” she said. “Xi-Tamyan has a scam going on in it that has profoundly compromised its research priorities for years. *Years*. Maybe since they came here.”

“Tell me,” Biryar said.

She did. Not only the way her liaison had added herself to the patent agreements, but that she was married to the union comptroller, that she had gotten the placement in Mona's office over several other more qualified applicants, that her reported income didn't remotely match the payments made to her. With every sentence, Mona's voice grew harder, the outrage rising the more she thought about it. Biryar listened, leaning forward with his hands clasped and his gaze on her. Every new detail felt like a weight on his chest. Corruption layered on corruption layered on corruption until it seemed like there was more disease than health.

“And,” Mona said, reaching her crescendo, “either management and the union didn't know, in which case they're incompetent, or they did, and they're complicit.”

Biryar lowered his head, letting it all settle. Mona's gaze was fixed on nothing, her head shaking a fraction of a centimeter back and forth, like she was scolding someone in her imagination. She probably was.

There was a soft knock at the door. One of the housekeepers hoping to sweep or change their bedding. Biryar told them to come back later and got a muttered apology in return. Mona hadn't even noticed. He risked taking her hand.

“That is disappointing,” he said.

“We have to *fix* it,” she said. “This can’t be permitted. This scam has cost *years*. Veronica has to be arrested and removed. The union has to be investigated and purged. I don’t know how deep this goes.”

“I will bring this to the attention of the local magistrates,” Biryar said. “We’ll address it.”

“Magistrates? No, we need to go now and arrest her. Ourselves. She’s undermining the most important colony world that there is. You’re the governor.”

“I understand that. I do. But if what she’s done is illegal under Auberon’s law, then it’s a matter for the local courts. If I step in, I have to step very carefully.”

Mona drew back her hand. The weight in Biryar’s gut grew heavier, the knot in his back ached. He pressed his lips thin, and went on.

“I am building on fear and hope,” he said. “Fear of the *Tempest* and the *Typhoon*, and hope that they won’t come. Our best path is to be seen as all-powerful but benevolent. Even indulgent. When we have a larger fleet, more experience, loyalty among the local police and military forces? Then we can enforce our ways here. We’re still in our first days. I have to be careful not to overreach.”

Disappointment changed the shape of Mona’s eyes. It softened her mouth. He felt the apology at the back of his throat, but it would have sounded like he was sorry for not giving her what she wanted, and he would mean he was sorry that the situation was what it was.

“If the payments to her don’t really go to her...” Mona said. “What if her income report is accurate? She could be part of a crime syndicate. That man who was here? With the arm? She could be working for him.”

“And I will have our people look into that. If she is, we’ll take action.”

“We should be taking action anyway,” Mona said. “I’m Laconia’s eyes on the most significant agricultural research that there is. You’re the governor of the planet. If we aren’t doing something, why are we here?”

“Please lower your voice.”

“Don’t patronize me, Biryar. It’s a real question.”

“We’re staying alive, Mona,” he snapped. “We are picking our fights, we’re identifying the most immediate threats and addressing them, and we are doing everything possible to give the impression that we could bring overwhelming power to bear and merely choose not to.”

“Because that isn’t true,” Mona said.

“It will be. Given time to establish ourselves, we can dominate any system, but we can’t dominate all of them at once. So this is how we govern. We are present, we exert influence, we exercise power when we have to, and we graciously allow self-rule until another option exists for us.”

“Self-rule?” Mona said, and her voice could cut skin. “Duarte sent us here so we could see the situation firsthand. And *react* to it. How is the two of us doing nothing self-rule?”

“Self-rule for them,” Biryar said. “Not for us.”

* * *

The old man sat on a metal barstool at the edge of the warehouse. Dust floated in the beam of light from holes near the roofline where ratdoves—which were neither rats nor doves—had chewed their way through to shelter. Agnete stood beside him, shifting her weight from one foot to the other, a pistol in her hand. The old man was watching and rewatching video from the official government newsfeed. The poor asshole kneeling on the platform, mouthing some words, then the governor nodding like an old Roman emperor giving the thumbs-down, and the executioner putting a bullet through the prisoner’s skull. Every time the gun fired, the old man laughed. It wasn’t mirth. It was derision.

“This man,” the old man said, tapping the frozen image of Governor Rittenaur, “is fucking hilarious.”

“He just killed one of his own men to make a point,” Agnete said.

“Right? You know who does that shit? Theater majors,” he said. Then, seeing her expression, he put the hand terminal in his pocket. “It’s easy to execute your own. Someone that follows your orders, they’re easy to kill.

This ‘We hold ourselves to an exacting standard’ thing? I’ve seen it before. It’s showy, because who does that shit? But it’s easy.”

“I don’t know, boss. It made an impression,” she said. In the distance, the whine of an electric motor and the clash of the steel fence rolling open. The old man heard it and rose from his stool.

“Well, it shouldn’t have,” he said, walking toward the loading dock. “We’re sure they were fighting? Him and his wife?”

Agnete shrugged. She didn’t like the way the boss thought about two things at once. It made her feel like he wasn’t concentrating on the business at hand.

“They were yelling at each other,” she said. “Your friend in housekeeping couldn’t make out all of what they were saying.”

“Interesting. Our guy didn’t want money, so maybe he’s not greedy. But if he and the sweetheart aren’t getting along, maybe there’s an itch we can scratch there.”

“Honeypot?”

“There’s a reason the classics are classic.”

“I’m on it,” Agnete said. “But after we’re done here.”

The loading dock door hummed for a second, warming up, then clattered as it rose. Dust and translucent scales came down into the light. The truck was old and rusting. The logo of a grain hauling company that had gone bankrupt four years earlier still peeled on its side. The back of the truck opened and four men came out. All of them carried guns.

The old man sniffed, cleared his throat, sneezed.

“Bless you,” one of the four men said. The leader.

“Thanks,” the old man said. The new men waited, motionless. Agnete tightened her grip on the gun, but didn’t raise it. For a long breath, no one moved.

“If this is the delivery,” the old man said, “maybe you could deliver it. If it’s something else...”

Bless You shook his head. “It’s the delivery, but the price has gone up.”

“Disappointing,” the old man said, but amiably. “How much?”

“Doubled.”

“Nope,” the old man said. “Too greedy. Try again.”

Bless You raised his gun and the old man's titanium arm moved too quickly for the eye to follow. The deafening report of the gunshot almost drowned out the metallic sound of the bullet impact. The thugs were quiet, as if they'd been stunned by their own violence.

"Boss?" Agnete said.

The old man had his real hand pressed to his chest, pain in his features. His false arm reached out before him and opened its closed fist. The bullet dropped to the warehouse floor with a sharp tick.

"You boys," the old man said, enunciating each word clearly, "just fucked all the way up."

"Hey, Erich," Bless You started to say, fear in his voice. An apology? Whatever it was, he never got to finish.

High in the rafters, the turret emplacement had heard the old man give the go phrase. The warehouse went bright with the stutter of its muzzle flash. The four men fell together. The staccato roar of the gun echoed through the warehouse space and then faded, leaving only a high-pitched whine in Agnete's ears.

"You all right?" she asked. Her voice sounded faint and distant. She opened and closed her jaw a few times to make the ringing in her head go away.

"Yeah, yeah," the old man said. "I just hate it when the arm does that. Feels like the fucking thing's about to rip loose every time."

"One of these days, it will." She walked to where the men were writhing in the guano and dust on the warehouse floor. Fléchette rounds had ripped bright red holes in their skin. The electrical smell of the shock rounds mixed with charred skin like roasting pig.

This was how the old man worked. Everyone had been looking at Agnete and her pistol, thinking she was the muscle. It had made them overconfident.

"You see," the old man said, not to the fallen thug but to Agnete, "this is the difference. A buy goes bad, and I need to send a message that that's not okay. I could go the Laconian way, right? Kill *you* and send these fuckers home. Would that make any sense?"

"I guess not," she said.

“Grandstanding,” the old man said, his false hand wrapping fingers around Bless You’s throat. “It’s immature, is what it is.”

Bless You tried to say something. Before he could, the old man used him to send a message.

* * *

Self-rule for them. Not for us.

Mona knew enough about psychology to put her feelings in context. As Veronica sat across the table from Mona, shifting the display between the reports, breaking down the datasets into digestible summaries and giving an overview of where the labs stood with the active experiments, Mona knew intellectually that the woman’s voice wasn’t really all that grating. Veronica’s habit of interrupting herself and never quite getting back to the first sentence wasn’t all that rare a quirk. Her haircut didn’t really make her look like she was wearing a “respectable administrator” costume. Those were all artifacts of Mona’s own state of mind.

The knowledge didn’t help.

“We’re expecting to see some data from the photosynthesis study at North Field by the end of the week,” Veronica said. “The preliminary report is, as you can tell, looking pretty good.”

She had to know, Mona thought. There was no way that the tension and antipathy were going under Veronica’s radar. The smile was just the same as it had always been, the solicitous manner, the ready facts and reports. The woman had to know that Mona loathed her, but there was no sign of it. So either Mona was very good at hiding her emotions or Veronica was.

“What about the microbiota compatibility studies?” Mona asked.

Veronica shook her head as she spoke. “Those aren’t in North Field. Balakrishnan’s workgroup is all in the old facility. I mean, nothing’s really old around here, right? We’ve only been on the planet for a couple decades.”

You’re changing the subject, Mona thought. Making Veronica Dietz uncomfortable was one of the few real pleasures in her day.

“When do we expect results from Balakrishnan’s study?” she asked.

“I think the next assay starts in about a month, but I’m not a hundred percent on that,” Veronica said. “I can check if you want.”

And tell me whatever is most convenient for you, Mona thought. If Balakrishnan’s results needed to be a failure to keep Veronica’s skimming unnoticed, Mona had no doubt that the study would mysteriously fail. Just the way Dr. Carmichael’s array translation study had become less promising when this woman—this snake, this parasite—didn’t get a piece of it.

“Take a look for me,” Mona said, standing up. “We can go over it in... five?”

“All right,” Veronica said, as if the request were perfectly reasonable. Prepare a report in the time it takes to brew a cup of tea. Mona waited as Veronica walked out—she wouldn’t leave the woman in her office alone—and then locked the office door behind her and headed right along the pale-green hall and then right again into the commissary.

She poured herself a cup of green tea and picked up a sugar cookie from the dessert table before sitting down alone at a table by the window. Tall white clouds rose on the horizon, glowing gold and red in the sunlight. She scowled at them. Someone had cracked the window open, and the breeze actually smelled fresh. She’d become so desensitized to the local environment that the fecal smell of the planet’s biology didn’t even register to her anymore.

The situation with Veronica was becoming a problem, and not just because Veronica was a problem. Mona was meant to be reporting back to Laconia. There was a whole team of soil researchers and agricultural biologists waiting for her to share the insights of Xi-Tamyán and Auberón. There had even been queries from Dr. Cortázar, which was one step short of attention from Winston Duarte himself. She should have had a preliminary report ready to go, outlining the state of play not only for research here but across the colony worlds that Auberón partnered with. Instead, she had notes on a criminal conspiracy, and a solemn injunction from Biryar that she should leave any action to the same regulatory bodies that had let it happen in the first place. The frustration was a restless energy in her spine. It was keeping her from focusing on her work. She had to get past it.

She couldn’t get past it.

She kept remembering Dr. Carmichael at the reception her first night on Auberon. Her own excitement she'd felt when she heard about the array translation, the possibilities that a comprehensive mapping plan would give, not just here but across all the colony systems. And the disbelief that anyone would intentionally undermine something with so much potential. It had been so recent, and yet that past version of herself already seemed so naive. Auberon was changing her, and she wasn't sure she liked what it was changing her into.

She finished her cookie in a bite, gulped down the last of her tea, and headed back to her office. Not that she wanted to be there. Just that the commissary was annoying her now too. Or rather that she was still annoyed, and nothing she'd found gave her any respite.

Veronica hadn't returned with the report. Mona sat at her desk, looking sourly out her window Same world, different view. Barradan spread out to her right: streets and houses and domes. The local wilderness was on her left, exotic and untamed and almost unimaginable in its diversity and richness and strangeness. This should have been everything she'd hoped for. All the pieces were there.

Self-rule for them, her husband said in her memory. *Not for us*. But...

Something shifted in the back of her mind. The thought came to her fully formed, like she had already planned everything and had only been waiting for the right moment to be conscious of it.

Point one: Either the administration of Xi-Tamyan was aware of Veronica's scheme or their eyes were so thoroughly off the ball that it had been permitted by default. Two: as the spouse of the governor, she was more valuable to Xi-Tamyan than Veronica Dietz would ever be. Three: What was good for the goose might very well be quite excellent for the gander.

She turned to her desk, a frown etching itself into her forehead almost hard enough to ache. She pulled up the financial records and tried to reallocate funds, just to make sure she couldn't. That was fine. Her breathing was shallow and fast, but when she made the connection request, her voice sounded calm.

“Dr. Rittenaur?” an older man said from the screen. He had thin, gray hair and a little beard that didn’t disguise his double chin. “How can I help you?”

“I’m having trouble with accounting. I need to allocate funds for a Laconian state project, but it gives me an error code.”

The man with the double chin looked chagrined. “I’m not... I’m not sure that...”

“It should be under Special Projects with the code for the Laconian science directorate? What would that be?”

“I don’t think we have a code set up for that, ma’am.”

“We’ll have to find something temporary, then. There is something for cooperative governmental programs, isn’t there? We can use that for now.”

“I... um... I guess you could,” the man said.

“Not perfect, but...” She shrugged and laughed. “If you clear the access problem, I’ll take care of it that way.”

She smiled patiently. She’d done nothing wrong. Not yet. If he pushed back, everything could be explained away. But she was the face of Laconia at Xi-Tamyan. And Laconia had just destroyed the largest navy in history and conquered the human race. She let the silence stretch. The man’s face flushed a shade darker as he decided whether he was going to tell her she couldn’t.

He tapped something into his console. “There you go, ma’am,” he said. “It gives you any more trouble, just let me know.”

Mona’s smile widened by just a few millimeters. “Thank you,” she said, and dropped the connection.

After that it was easy. She copied Dr. Carmichael’s old funding structure and put it in a new branch under joint governmental projects, updated the contact information so that any issues or questions routed directly to her. She was expecting the funding level to refer back to some pool of money, but it was just a text field. She could put in any value she liked, and the money was summoned from nothing. She put in the value that Veronica’s unspecified *powers that be* had refused. Then she doubled it, and closed the file.

Just like that, she'd funded the project that should have been going for months. She'd wait for a few days. Make sure that no red flags came up, and then she'd tell Dr. Carmichael to start renting lab space and equipment.

She sat back in her chair, folded her hands, and let out a long, satisfied sigh. There was a warmth in her chest, spreading slowly out toward her limbs like she'd just had a shot of gin. Her back relaxed, her heart felt like she was dropping from orbit for the first time. Pleasure and risk. On impulse, she kicked her shoes off and ran her bare feet through the office carpet, feeling the texture of it against her skin.

The soft knock came, and Veronica stepped in. "Sorry that took a little longer than I'd thought. Interruptions all the time. You know how it is."

"Yes, I do," Mona said.

* * *

Biryar didn't know what changed in Mona, only that something had, and he was glad of it. He saw it in small things. She slept more deeply now, and woke without being prodded. She ate better, and explored more of the local foods—fish and onion and a spicy red sauce the locals called sarkansmirch. He'd sampled it himself, but found a metallic aftertaste he didn't care for. She was laughing more than she had, and there was an ease in the way she held herself.

Her work with Xi-Tamyar might have been part of it. She had started sending reports out to the researchers on Laconia, and the responses from home had been positive and encouraging. She'd begun negotiations for Laconia to get full datasets directly from the company and integrate some of its high-level researchers into the staff on Laconia proper. It was part of Duarte's long-term plan that coming to the capitol should be a reward. A mark of favor. The soft power of culture and status would do more to stabilize Laconia's central position in the grand human project than any number of warships. It was good that Mona's position let her advance that.

Biryar's own job wasn't going quite as smoothly.

He hadn't found the trick yet of sleeping through the Auberon nights. Most nights, he woke as the midnight sun fell, lying awake in their bed for

half of the dark hours until morning. He'd considered talking to the physician about it. If it continued, he might. The local food also unsettled him, and he found himself eating the same diet he had on the *Notus*: mushroom curries and yeast-based cheeses. Even those didn't quite taste the way they should. He might not register the stink of the planet as often these days, but it had affected his senses all the same. And the pervasive sensation of unease, as vague as it was profound, wasn't helped by Overstreet's security briefings.

In the weeks since Laconia had officially taken over governance of the system, Overstreet had uncovered a dozen examples of embezzlement, theft, extortion, and financial misconduct just in the mechanisms of government that Biryar had inherited from the former head of state. Only two had involved Laconians. One had been the execution in the square, the other had killed himself when Overstreet's military police had come to arrest him. Everyone else had been turned over to local authorities, but Overstreet suspected that the judicial system was as flawed as the executive government. As the security audit broadened to the major businesses—the Transport Union, Xi-Tamyan, Oesterling Biotics, and half a dozen more—Biryar expected more rot to come to light.

The only good news Overstreet had to offer was the disappearance of the one-armed man. He hadn't appeared in any monitored public spaces. He hadn't shown up in any financial scans. If it hadn't been for the footage from the reception, he might only have been an unpleasant dream. Overstreet's analysis was that a local criminal had tried to come on strong, overplayed his hand, and fled when he understood the magnitude of his miscalculation.

The reports coming in from other systems showed that the separatists were still very much at work. The governor of Nova Catalunya, a man Biryar had trained with, had died in a shuttle accident that was being investigated for sabotage. Governor Song, on Medina Station, found another discrepancy in the station map that hid a service corridor, abandoned now, that the terrorists had used as they planned their missions. Drive plumes had been sighted in half a dozen systems that couldn't be tracked back to known ships.

The ghosts of unrest were everywhere. The separatists couldn't stand in an open battle with Laconia, but they could resist in small ways, and those small ways could have body counts too. He didn't bring his worries to Mona. Better that one of them should sleep well. If it felt a little strange not to tell her everything, at least the cause was noble. He still felt the urge now and then to unburden himself to her. He didn't have anyone else.

Instead, he tried to keep his attention on his own duties: playing kingmaker in local politics until Laconia was so established and unquestionable that he could play king. He found himself crafting the role of Governor Rittenaur as if he were acting a part in a play. He had come to notice when his own impulses were different from what Governor Rittenaur's would be, and then bury his own judgment to give space to the requirement of his office. He was a professional impersonator of himself. It required, among other things, a close relationship with the local newsfeeds.

"I understand that the *Notus* is slated to leave Auberon," Lara Kasten said. She was a host for one of the popular public newsfeeds. Not a reporter, but a warm, approachable interviewer whose greatest strength was the intensity with which she could listen.

"It's already burning for the ring gate," he said. "It will still be weeks before it leaves the system, but yes. It's on its way."

"That's got to feel a little odd."

His office, decorated in the local style, had casual chairs set beside a window that looked out over a garden of Earth plants. This was the fifth interview he'd granted her. It was important that the local population know him. Normalize his presence. Lara's approach to their conversations suited his needs.

"Not really," Biryar said, looking out at the red sunset of late morning. Clouds on the eastern horizon already turning from gold to gray. "The *Notus* is a valuable resource, and needed elsewhere. We have a great deal of work to do here, but Auberon doesn't need a warship. We're a very safe system. The situation is quite stable, and with the loyalty and cooperation of the authorities, I expect it will stay that way."

Lara smiled and leaned forward to pick up a glass of iced tea. She took it with sugar. He knew that from the last time they'd talked. Previously,

she'd worn a high-collared white blouse, but today she had one in Laconian blue with a scoop. Instead of returning the glass to the side table, she leaned forward and put it by her feet. He was careful not to notice the tops of her breasts as she did it.

"But it was your way home, wasn't it?" she said. "Even if you never intended to use it. You spent your whole life on Laconia?"

"I did. But Auberon is my home now."

"What's that like for you?" she asked, and he thought there was a real curiosity in the question. He saw himself for a moment through her eyes. The proverbial stranger in a strange land, given power and responsibility and asked to be strong for his nation and the people over whom he ruled.

"I'm happy to be here. I am. Auberon is a beautiful planet and an important part of the empire."

He nodded to himself, silently approving his own answer. That was the right thing to say, and the right way to say it. Turn the question back to the system itself. Not him, but them. Good that when the locals look at him, they see themselves reflected.

He waited for the next question, but Lara was quiet. The sky darkened, and the first stars came out. The little moon, halfway to full, glimmered. She tilted her head, the straight, honey-colored hair hiding one eye, an impish smile on her lips. Biryar felt himself smiling back, and he chuckled when he spoke.

"What?"

"You're happy to be here? That's all? You're the most important man in this system. There are literally millions of people looking up to you. You're on a planet you didn't set foot on until it *belonged* to you. It must be... hard? Intoxicating? What is it like for you, Biryar?"

He shook his head. The breeze from the window was warm against his cheek. Lara's eyes were locked on his. He found that he wanted to tell her. He wanted to spread out all the ways that being Governor Rittenaur of Auberon system was different from what he'd expected, even after his training. The displacement of being so far from everything he'd known, the unease of knowing that there were people who hated him, not for himself but what he stood for.

That wasn't what his duty required of him.

"I can't imagine anyone's terribly interested in that," he said, and his voice sounded almost melancholy in his ears. That was odd. He recentered himself and said, "I am really very happy to be here."

Lara's smile faded. The last red light of sunset caught the curve of her throat, and Biryar felt the impulse to turn the office lights on. He also felt the impulse to leave them off. He didn't move. Her expression wasn't impish now. He remembered the time in their third interview when she'd told him about her brother's death, how sorrowful she'd been. How strong in her grief. Of all the people on this stinking world, he felt closer to Lara than to anyone that hadn't come on the *Notus* with him. She knew him.

She leaned forward again, this time reaching not for her drink but her handheld. She held it up for him to see. The recording marked second after silent second. She turned it off and set it back down.

"What is this like for you?" she said.

He was silent for a moment, uncertain whether he was going to answer. However much he wanted to.

"It's..." Biryar was surprised to find a thickness in his throat. "It's difficult. Sometimes."

She nodded, acknowledgment and encouragement in the same single motion. Biryar leaned toward her, his elbows on his knees, his hands clasped.

"I am trained for my duties as thoroughly as anyone could be. But knowing something intellectually or from simulations... it isn't the same."

"You feel alone," Lara said.

"I do, in a way," Biryar said. "This is off the record, of course."

Her smile was in shadows now, but he could make it out. "Just between us," she said, and traced an X over her chest. "Cross my heart."

He felt something shift, deep in his gut. Like a relaxation of a fist held clenched so long that the letting go ached. He drew in a breath, held it, and as he exhaled, he sank. "It's overwhelming. Not always, but sometimes. I feel like a splinter, and Auberon is festering around me. Isolating me. Trying to push me out."

Her voice was soft, but not pitying. He couldn't have stood it if she pitied him. "That's terrible, Biryar."

"It is. And I don't know what to do about it."

For a moment, the only sounds were the ticking of the walls as they cooled in the darkness and the murmur of midday traffic in the distant streets. Lara shifted, and he found himself very aware of her presence. Her physicality and solidity. Her hand touched his, and it felt like a rope to a drowning man. She moved close to him, and he had the weird impression that she was reaching for the pistol at his side, that she was going to take it from him to make some demonstration of a larger point. It was only when her lips touched his that his mind exploded in cold alarm.

He stood up, backing away in the darkness of the room. "I'm sorry. No, no. I'm very sorry. I didn't... This is not..."

He found his desk, pulled up his controls, and turned on the lights. The office flooded with the bright blue-yellow of the daytime. Lara knelt in the space between their chairs, looking up at him in surprise. Biryar wiped his hands on the sides of his jacket. His tongue felt like it wasn't responding the way it should. Like he was having a stroke.

"This is..." He shook his head. "We should... we should finish the interview. This was very nice. I'm glad to have your friendship. Yes. We should finish the interview."

He pressed his lips shut to make himself stop talking. He sounded like an idiot. Lara rose to her feet. She wasn't blushing as much as he was.

"Biryar, I'm sorry," she said. "It's just—"

"No. It's fine. Everything is fine. There won't be any repercussions."

Lara eased herself back into her chair, plucked her blouse straight. Biryar stepped closer, but didn't take his seat. His blood was still electric. What if someone had seen them? What was he going to say to Mona, because he had to tell Mona. It would be a betrayal not to. He swallowed.

"I didn't mean to spook you," Lara said.

"I'm not spooked," he said. He meant to follow it up with *I'm married*, but what came out was different. "I'm Laconian."

Lara quirked a smile, and he thought there was regret in it. She took her handheld, her finger hovering just above the button to start the recording

again. Her eyes were asking if he was certain, but he was himself again. Or no. He was Governor Rittenaur. That was better. She tapped the button, and the seconds began counting up again. Biryar put his hands on the back of his chair, pressing into it like it was a podium. He thought back to where the conversation had been.

“I’m really very happy to be here,” he said. “Auberon is a fascinating planet with a great future before it. I hope that my service here will help it come into its rightful place as one of humanity’s great centers of science and culture. And I know the High Consul has the same ambitions for it.”

He nodded sharply, more to himself than to her. That was the right answer. That was what he was supposed to say. Who he was supposed to be.

Lara tilted her head. “Do you want to sit down?”

* * *

The yacht was a small one, and the old man didn’t like it much. In all the time Agnete had been with him, he had only used it three or four times that she knew of. He’d grown up in a coastal city, but she didn’t have the impression there had been a lot of yachts involved. The fact that he was in it now meant he was running out of places to be that he was certain the local security forces weren’t watching.

He sat with his arms out at his sides. Two days of stubble competed with his thin mustache. The sun was overhead, the light glimmering off the water and his false arm. He was smoking a cigar as thick as his thumb and as long as his finger. The city rose up at the horizon like a mirage.

The woman sitting across from them had gone by KarKara when they’d first met her. It was Lara now, which suited her better.

“I swear to God, I had him.”

“We shouldn’t have rushed you,” the old man said.

“I didn’t rush. I had him. We had rapport. We had shared jokes. He was into me.”

“And then?”

Lara opened her hands. “Then the moment came, and he backpedaled. I don’t know. Clearly he and his wife have a monogamy agreement, and he’s

taking it seriously. Maybe that's a Laconian thing."

"Did he say that?"

"No, it's a guess," Lara said. "He was babbling by the end. Lots of words, but none of them meant anything."

"What do you think of him?"

She considered. Agnete could see from the way the woman held her hands that Lara almost liked the mark. There was nothing like being told *no* to make someone attractive.

"That man needs something," Lara said, "and he needs it bad. But it's not what I was offering."

The old man blew out a cloud of white smoke and watched the wind shred it. "That's what I think too. Is he maybe into guys?"

"That's not it," Lara said. "I've met maybe one person in twenty who claims to be monogamous and actually is. I think this guy is really into his wife."

The old man muttered something obscene. Then, "I don't get it. He's not looking for money. He's not looking for kink. What is it with this guy?"

Lara said, "I think he's looking for a way out."

"Of what?"

"His own skin."

"Well *I'm* looking for a way not to take that literally, but this fucker does make it hard." He looked out over the water. Something large and pale passed under them, but didn't break the surface. The old man sighed. "Maybe we should just kill him."

Agnete said, "Why were they fighting?"

He shifted his head to look at her. Agnete met his gaze without flinching. "He and his wife were fighting about something. And then they stopped. Maybe there's something in that?"

The old man weighed the idea while he took another puff on his cigar. His eyes shifted up to the sky, but he wasn't looking at anything. Or not anything that was there.

"He have any friends?"

Lara shook her head. "None that he ever talked about. He doesn't do relationships with people. Just responsibilities to them."

“So just the wife, then, as far as you know. Sex and friendship. That’s a tough knot to unwind.”

“I think he really loves her,” she said. Again the little twitch of regret. They were going to have to be careful how they used her, moving forward. She was going to talk herself into falling in love with Rittenaur if they took their eyes off her.

The old man made a deep, soft sound. Like satisfaction. The yacht bobbed on the waves. “I forget, you know? I just forget.”

“What, boss?”

“How complicated people are. How many kinds of hunger we’re working with.”

“Not following you.”

The old man shrugged, and the fake arm almost matched the real one. The movement was still just a little asymmetrical. It made him seem jaunty.

“There was a guy I knew back in Sol system used to say that money was like sex. You thought it would fix everything until you got a lot of it. Because that’s what we all reach for. Anything we need, anything we want, anything that’s grinding us down, we can get high or rich or laid and make it better. Only if that was true, people would eventually get enough drugs or money or sex and be happy.”

“We’d be out of jobs,” Agnete said.

“But Rittenaur...” The old man went on like she hadn’t spoken. “This guy lives his whole life in this culture where it’s about...”

“Duty,” Lara said.

“So,” Agnete said, “the way a normal person tries to get out of the hole by putting a needle in their arm or fucking a pretty body or working a hundred hours a week, he tries to get out by being a good man.” She said the words slowly to see if they sounded true.

“Only it doesn’t work for him any better than that other shit does for the rest of us,” the old man said. Then, a moment later, “Look at the wife. If he loves her as much as Lara thinks, she’s the weak spot.”

“What am I looking for?” Agnete asked.

“Whatever’s there. Every addict has to hit bottom,” the old man said. “Maybe we can help him with that.”

“I’ll see what I can do,” Agnete said.

“I know it didn’t exactly work, but...” Lara hesitated, afraid to ask. “Our thing?”

She was asking about the debt her attempted seduction was going to pay off.

“How much did you owe us?” he asked.

“You know exactly how much,” Lara replied.

“Yeah, yeah, it’s off the books now,” the old man said. “But stay out of my casinos. You’re very bad at poker.”

Business concluded, they watched the sun speed across the sky and dive for the horizon. The water was turning golden as they angled back for shore. The old man made them all steaks on the little range, the meat decanted fresh from the growth disk.

When they got back to civilization, Agnete put her resources into the wife and Xi-Tamyan Agricultural Concern, where she had offices. She wasn’t looking for something in particular—an affair, an illegal drug habit, a second life. Anything.

Even so, it took her days to find it.

* * *

Biryar didn’t know what he had expected from Mona when he told her. Anger, perhaps. A sense of betrayal. A rupture in their marriage at least, an estrangement at worst. He had laid out all that had happened: the interviews, the connection that had been cultivated during them, and—with his heart in his throat—the kiss. Mona sat across the breakfast table from him, listening to every detail. Only at the end, when he outlined all the precautions he was putting in place to see that it never happened again, did a line of concern draw itself on her forehead.

“She just stole a kiss?” Mona asked. “That’s all?”

“But I allowed myself to permit a sense of... of intimacy that made it possible,” Biryar said. His eggs had grown cold and thick while he spoke. “This was my fault. It will never happen again.”

She'd taken his hand then, and when she spoke there was a seriousness in her voice so studied and careful that he suspected there was amusement behind it. "Thank you for treating me with respect. I mean that. But I'm not angry with you at all. Don't beat yourself up over this, all right?"

He kissed her fingers, and the subject had never come up again. He went back to his duties with the relief of having dodged a bullet. He policed himself more harshly, wary of any other transgression. Biryar the man wasn't to be trusted. There was only room for Governor Rittenaur, so he tightened his control and pushed out anything besides duty and decorum. It was the only way.

He attended meetings with Suyet Klinger of the Association of Worlds and approved the trade agreements for the Transport Union. He stood witness at another execution when Overstreet discovered a Laconian guard who had been extorting sexual favors from a local man. He made his reports to the political officer back on Laconia and received guidance that tracked back to Winston Duarte himself.

That he couldn't sleep, that his food tasted strange and left his stomach upset, that the sunlight began to give him headaches, that he sometimes had the weird oppressive sense of drowning at the bottom of an ocean of air, that was only his acclimation going slowly. A few more weeks, and he would be fine, he was sure of it.

He was able to maintain the illusion that everything was under control until the day the one-armed man reappeared.

The conference was in Carlisle. It was the third-largest city on the planet, and fewer than a million people lived in it and the area around it. It was in a higher clime than Barradan and in the northern hemisphere where the seasonal shift made the air was cold and the daylight periods slightly briefer. The trees were similar to the ones in Barradan, but with the cold weather, they had shriveled, wrinkled, and gone limp. The dark trunks bent toward the stony ground. The reception and Biryar's speech had been planned for a courtyard in the center of the mayoral complex, but a storm changed direction as Biryar's transport left Barradan, and a cold and bitter rain was pelting down from low clouds when he arrived. As his liaison rushed him from his transport and into the mayoral complex, Biryar sniffed

the air, hoping to find some hint of the minty smell of wet Laconian soil. Rain on Auberon smelled like nothing. Or it smelled like an open sewer, and he couldn't tell any longer. One or the other.

The liaison apologized his way down the wide, pale hallway. The change in the weather had come with no warning. They hadn't thought they would need to shift to the secondary venue—a public theater just across from the complex—until the last moment. It would only take them a little time to have it ready and the audience of local business and government leaders taken there. Biryar swallowed his annoyance and made himself as gracious as he imagined Duarte would have been in his place.

The waiting area belonged to the mayor herself, part of her private apartment. If he would make himself at home and be comfortable...

In fairness, the waiting room was pleasant enough. A wide glass window looked out over a vast, wild landscape. Rough, toothlike mountains rose above the city, halfway lost in the gray of the storm. The rain that struck the window froze there for a moment, then melted and dripped down. When the clouds finally cleared, the landscape would be encased in ice. Ice like a second skin. Ice like a shroud.

His speech was on the importance of maintaining robust trade with the other systems and Laconia's commitment to keeping the economy of Auberon strong. He knew it by heart. Instead of reviewing it again, he sat on the little couch and looked out at the weather. The door opened behind him, and a man in a crisp white jacket and matching gloves came in carrying a tray with a thermos of coffee, two cups, and a plate of pastries.

"Put them on the table here," Biryar said. "I can serve myself."

"You know, Governor," the old man said as he placed the thermos and cups on the table at Biryar's side, "I have got to give it to your security people. I've been trying to see you for a while now, and they've got your place buttoned up tighter than a horsefly's asshole."

The old man smiled. Even before Biryar registered the glint of metal between the man's cuff and his glove, he remembered the thin mustache.

He's come to kill me, Biryar thought, and a thrill ran through him. He felt the weight of the sidearm on his hip, even as he sensed that a gun

probably wasn't going to help. He knew enough killers to know that he wasn't one, and that the man facing him was. He nodded solemnly.

"I was wondering if I'd see you again. You've been hard to find as well."

The one-armed man sat down across from him and spoke as he plucked off his gloves. "Well, I was worried that we'd gotten off on the wrong foot. That's my fault. I come on a little strong sometimes. You want some coffee?"

"Cream, please," Biryar said. His heart was tapping against his ribs like it was desperate for his attention. He let his hand casually drift toward his hip.

The one-armed man's voice was harder. "If you pull that gun, it'll mean we're having the worst version of this conversation. Honest to Pete, you'll wish you hadn't. No sweetener?"

"No," Biryar said. He let his hand drop to the sofa, near his holster but motionless. It was dangerous to move forward, but he wasn't going to give up ground either. He imagined pulling the gun and firing. How quickly could he do that? How long could it take? The rest of his life, maybe. "Just cream."

"Good choice. I like it black myself. The older I get, the more bitter shit suits me. You ever feel like that?"

"Sometimes," Biryar said.

The man held out a coffee cup on a saucer, and Biryar nodded toward the table. He wouldn't take it. The old man was holding it with his prosthetic hand. How fast was the mechanism? What weapons were concealed in it? It was like watching a snake that he knew was venomous, and wondering how long a bite would take to stop his breath.

"What can I do for you?" Biryar said, trying desperately to make the words sound casual. As if he were in control. "Or are you here to make good on your threat?"

"Nah, we're past that. But I am here on business, as it were," the man said, putting the coffee cup down on the table. "I have something for you. Kind of a peace offering."

“I didn’t know peace was an option between us. I was hoping to have you tried, sentenced, and executed.” The provocation struck home. The man smoothed his mustache. Biryar knew he shouldn’t have said it, but the fear was shifting in him. Turning to something like courage. Or anger. Or a mad, dark, rushing hope that Biryar didn’t wholly understand.

“I get that. But let me ask you something. Hypothetically, there’s someone in your organization. Laconian, not one of ours. Let’s say they’re making up projects in your name, using them to falsify work orders. Fudging the budget. That’s a problem for you, right?”

“You know the answer to that.”

“I do. But I’d like to hear you say it just the same. If it’s not a problem.”

The one-armed man looked distracted by the conversation. A few centimeters would put his hand on the pistol. The angle made it awkward to draw. Biryar shifted his weight a little to make it easier, and the one-armed man shook his head like he was reading his mind.

“Misappropriation of Laconian funds is at best larceny, at worst treason,” Biryar said. “One is a prison sentence. The other is death.”

“What about a governor’s pardon? You can do that, right?”

“No Laconian is above the law,” Biryar said. “That is what discipline means.”

“That’s what I thought,” the old man said. His eyes locked on Biryar’s as he drew a handheld from his pocket. “For what it’s worth, I am sorry about this.”

He held it out. Biryar’s gaze flickered down to it, and then back up, ready for the attack. It took a few seconds for what he’d seen to register. Mona Rittenaur. Almost against his will, his eyes drifted back down. The old man kept holding it out, and this time Biryar took it.

The financial records were marked as Xi-Tamyan, and the spreadsheet listed Mona’s name. And monetary amounts. Budget levels and outflows. There were other names, and one rang a bell. Carmichael. The woman whose research had been unfairly canceled. The one they’d fought over. The one-armed man forgotten, he shifted through the files. Mona’s name was highlighted. And the words *cooperative government programs*. If

programs like that existed, he would have known about them. He would have had to approve them. He hadn't.

The storm had grown worse, the wind so terrible, it was shaking the building itself, making the walls shudder, only it wasn't any louder. And the beige surface of the coffee was smooth and still. Something else was shaking. Biryar put down the handheld.

"What do you want from me?"

"Nothing," the man said. "I'm just letting you know that one of your own stepped a little off the path."

"Blackmail?"

"For blackmail, you need an ask. I don't want anything from you. I have this information. I'm giving it to you. That's all. I'm being the good guy here."

And now it was his duty to tell what he'd learned to Major Overstreet. And it would be Overstreet's duty to arrest Mona. Biryar would have to recuse himself, so they'd send her back to Laconia for trial. His Mona. The woman whose fingers he kissed in the morning. He tried to imagine what it would feel like to see her sent to the Pens. It was like trying to imagine being dead.

Or he could hide the information, make her scrub away all sign of it. Cancel the projects. Erase the financial trail that led to her. Then, when Overstreet found them, they would die together. His sternum ached like he'd been punched there. Everything under it was hollow. He could hardly draw a breath.

It was perfect. Even if he could pull his pistol and shoot the one-armed man dead, there was still a bullet coming for him. Worse, it was coming for Mona, and there was no way to stop it. He couldn't even die to protect her. He tried to move, but he was made from clay. He saw sympathy in the other man's eyes.

"Truth is, if Xi-Tamyan found out about this, they'd probably praise her initiative and give her a raise. Those guys just do business that way. But she's one of yours, so..."

"Discipline," Biryar said. There was no way out. The end of his world had come. There was nothing to do but welcome it.

It wasn't a thought, it wasn't considered. Like water moving down, it was simply the way things worked. The way they had to be. Natural. Biryar drew the pistol, lifted it to his head, and pulled the trigger. The old man's eyes barely had time to widen.

His false arm, though, had a mind of its own, and it was faster than either of theirs. Before the trigger came back a full millimeter, the gun wrenched away. The old man cried out, clutching his real hand to his chest. The metal hand held Biryar's pistol, its barrel visibly bent.

"Jesus *fuck*, but I hate it when it does that," the old man said. Then, with heat, "Fuck is *wrong* with you, kid?"

Biryar didn't answer. He wasn't there. Governor Rittenaur, the voice and face of Winston Duarte, didn't make sense here, and without him, Biryar was like a vine whose trellis had collapsed. He had no form. No structure. He couldn't even die.

The one-armed man put the ruined pistol on the table, picked up Biryar's cup of coffee, and sipped from it.

"Okay. I get it."

"I can't lose her," Biryar said. "I can't stay with her, and I can't lose her. What else is there to do?"

"They really do a fucking job on you people, don't they?" the one-armed man said. Then after a long moment, he sighed. "Listen to me. I didn't lose my arm in a fight or anything. I was born wrong. Something about not enough blood flow. Stunted development. Whatever. It was like a skinny little baby arm. Mostly I just kind of curled it up against my chest here and forgot about it. I did fine. It was nothing big. I kept meaning to get it seen to, you know? Take it off and regrow it from gel? But one thing and another, I just never seemed to get around to it. You know what I mean? People would give me shit, and I'd laugh and say how, yeah, it would be a good idea. But I didn't do it. Then maybe fifteen years ago..."

He raised his metal hand, rotating it in the light.

"This," the old man said. "It's fucking badass. Basically a built-in waldo with virtual intelligence and pattern matching. It's not networked, so it's unhackable. And it's strong as shit. Bends steel. Stops bullets. You know what else it does? Plays piano. No shit. I can't, but it can."

“It’s very nice,” Biryar said.

“You’re young yet. I’m not. There’s this thing when you get older where you have to make a choice. Everyone does. You have to decide whether you care more about being your best self or your real one. If you’re more loyal to who you ought to be or who you really are. You know what I’m talking about?”

Biryar nodded. He was weeping.

“Yeah,” the old man said. “I thought you might. I’m going to tell you a secret. I’ve never told anyone this, not my girlfriends, not my closest allies. No one. You listening to me?”

Biryar nodded again.

“I miss my real fucking arm,” the old man said. “I liked it better when I was me.”

Biryar sobbed, and it sounded like a cough.

“I don’t want anything from you, Governor. But I would ask you this. Looking at where you are now, and the choices you’ve got? Is there anything you maybe want from me?”

The wind howled, threw a handful of hail at the window. Biryar barely heard it.

“You can’t make this go away,” he said. “Overstreet will find it. He’ll know.”

“He will,” the old man said. “You know. If.”

They were quiet. Biryar felt something happening in him. Something he both didn’t recognize and also knew as well as the sound of his own voice. “Could you have done it? Could you have killed me?”

“Yeah,” the old man said. “Half a dozen times. Easy. But it would have been a risk. I don’t get to pick your replacement, right? Thing about this Overstreet fella? He’s not on his home pitch. If something happened to him, maybe it’d be a good idea to put together some locals to take over the security jobs. People who know the lay of the land. How things work here.”

“If something happened to him?”

“Yeah. If,” the old man said. And then, “Do you want it to?”

Biryar breathed yes.

The one-armed man relaxed and stood up. He put on his gloves again, looked out at the sleet and rain and hail. The half-hidden mountains. “This isn’t just you.”

“What?”

“Don’t feel bad, because it ain’t just you,” the one-armed man said with a lopsided shrug. “There are, what, a couple hundred decent-sized colony worlds with shiny new Laconian governors on them? And this thing has or is going to happen on every single one. It’s the basic problem with religion, be it Jesus or Vishnu or God Emperors. Ideological purity never survives contact with the enemy.”

“I don’t—” Biryar started.

“Yeah, you do,” the one-armed man said, then stepped out and closed the door behind him.

Biryar sat for a moment, waiting for the guilt and horror to come, for his conscience to overwhelm him. Half a planet away, Major Overstreet was probably just waking up. There was time to call him. To warn him. Mona was waking up too, in their bed. Biryar took a long breath and let it out through his teeth. He felt something deep and profound, but he didn’t know what he felt. It was too big to judge.

The liaison came in, and Biryar tucked the handheld in his pocket. The liaison’s eyes widened at the pistol, but Biryar pretended not to notice that it was there. They walked together across a covered bridge and into the theater where his audience was waiting.

* * *

Mona felt the hair on the back of her neck go up the moment she stepped into her house and found Veronica Dietz waiting in the parlor. It had been a long day that followed a restless night. Biryar had been in Carlisle, and she never slept as well when he wasn’t on the other half of the bed. She’d wanted nothing more than to come home, take off her shoes, drink some wine, and relax. Finding Veronica lying in wait was like feeling a snake move in her pillowcase.

“Veronica,” she said, feigning pleasure.

“Yes, ma’am,” Veronica said, and then stopped. It was like she was waiting for Mona to say something. The moment stretched.

“I wasn’t expecting to see you here,” Mona said, carefully.

Veronica blinked, confused. “Oh,” she said. “I had a request from the governor’s office. I thought... that is I assumed that you—”

“I’m sorry,” Biryar said, coming into the room. “That was me.” He took Mona’s hand, squeezed it gently, and kissed her fingers. “I missed you.”

“I’m glad you’re back,” Mona said. Something was wrong. Or if not wrong, at least very different. She didn’t understand what was happening, except that Biryar was ushering them both to sofas and motioning them to sit. “How was Carlisle?”

“Fine. It was fine. I had some time to think, and I wanted you both here.”

Mona felt a stab of fear, but she took a seat. Veronica lowered herself into a chair. “What’s this about, dear?” Mona asked.

“It’s important that Auberon and Laconia be very much coordinated. In the sciences,” Biryar said. There was something very odd about the way he spoke. He seemed looser. Calmer. Maybe a little melancholy. That might have been more alarming than Veronica’s presence. “So I’ve taken the liberty of requesting a placement at the science directorate in the capitol. And I’ve recommended Ms. Dietz for the position. Transport will be entirely taken care of. Your housing will be in the university complex with some of the best minds in the empire. Xi-Tamyan has already been informed.”

Veronica’s mouth was open. Her face was pale. Mona felt like she’d been spun too long on a swing. She didn’t understand what Biryar was thinking. And then she did.

“Her living expenses...” Mona said.

“All overseen by Laconia,” Biryar said. “*Everything* will be overseen by Laconia.”

“I can’t do that,” Veronica said, and her voice was tight. “That’s very kind of you. That’s... But I have so much here that I can’t really—”

Biryar raised a hand, and his voice went quiet. Quiet, but not soft. “Ms. Dietz, it is critical to the success of this colony that you understand what

Laconian culture and discipline are, just as we learn what it is to be from Auberon. You will accept this position, and you will take the honor seriously. We will be treating you as one of our own.”

Veronica seemed to be having a little trouble breathing. Mona felt something equal parts joy and vindictiveness brighten her heart. She thought she saw Biryar glance at her, a smile ghosting on his lips, but it was gone before she could be certain. His handheld chimed, and he looked at it before refusing the connection. When he looked back up, he was somber. He stood and drew Veronica to standing.

“This position could change your life,” he said.

“I don’t know what to say,” she said.

“You’re welcome,” Biryar said, and escorted her to the door. “Please don’t mention it. I hope you won’t think I’m rude, but—”

“No,” she said. “No, of course.”

“Good,” he said, and closed the door behind her. When they were alone, he seemed to sag into his bones, all his muscles gone slack. He turned back to her and smiled sheepishly. Mona shook her head.

“Are you all right?”

“Yes. No. I don’t know. I feel like I’m smiling more often,” Biryar said as he came back and sat beside her. He rested his head on her shoulder the way he had when they were first courting. It made him seem younger. “Next time, let me approve it. It’s safer that way.”

She was about to say *Approve what?* but the question would have been a lie. He knew, and she knew that he did. Instead, she said, “I will.”

His handheld chimed again. She caught a glimpse of it as he silenced it. The red band of a high security alert. An emergency. He took her hand, lacing his fingers in among hers.

“Who’s that from?” she asked.

“Overstreet’s office,” Biryar said. “I’ll get back to them. It’s nothing that won’t wait a few minutes.”

She shifted to look him in the eyes. He was serene. He was grieving. He was himself in a way she hadn’t seen in months.

“What happened?” she whispered.

She felt him shrug. She watched him look into her. “I’ve committed to the process,” he said.

The handheld chimed again.

James S.A. Corey is the pen name of fantasy author Daniel Abraham and Ty Franck, George R.R. Martin's assistants. They both live in Albuquerque, New Mexico. The first and last name are taken from Abraham's and Franck's middle names, respectively, and S.A. are the initials of Abraham's daughter.

Under that name they wrote *The Expanse*, a series of science fiction novels, novellas, and stories, that has also been adapted for television under the same name.

OceanofPDF.com

The background of the book cover is a dramatic, high-contrast illustration. It depicts a massive, dark, industrial structure, possibly a space station or a large ship, with a curved, ribbed section. A bright, fiery explosion or fireball is erupting from the right side of the structure, casting a strong yellow and orange glow across the scene. The sky is a deep orange, suggesting a sunset or a fire. The overall tone is epic and action-packed.

Prologue

First there was a man named Winston Duarte. And then there wasn't.

The last moment had been banal. He'd been in his private study at the heart of the State Building, sitting on his divan. His desk—Laconian rainwood, with a grain like sedimentary rock—had an inset screen showing the thousand different reports vying for his attention. The clockwork of the empire ground slowly forward, with every revolution of the wheel making the mechanism a little smoother and more precise. He'd been reviewing the security reports from Auberon, where the governor, responding to separatist violence, had begun recruiting locals into the system security forces. His own daughter, Teresa, had been on one of her illicit adventures outside the grounds. The solitary nature hikes which she believed to be outside the watchful eye of Laconian Security were developmentally important for her, and he looked on them with not only indulgence but pride.

He had only recently told her about his ambitions for her: to join him as Paolo Cortázar's second patient, to have her awareness opened and deepened as his had been, to live perhaps not forever but at least indefinitely. A hundred years from now, they would still be guiding the human empire. A thousand. Ten thousand years.

If.

That was the terrible pressure behind it all. The overwhelming *if*. If he could push back against the human habit of complacency. If he could convince the vast, incoherent scrum that was humanity that they had to take action to avoid the fate of their predecessors. Either they did whatever it took to understand and defeat the darkness on the third side of the ring gate, or they died at its hand.

The experiments in Tecoma system were like all the critical steps that had come throughout human history. Ever since the first mammal decided to rise on its hind legs to see above the grass. If it worked, it would change

everything again. Everything changed everything that had come before. It was the least surprising thing in life.

He had reached for his tea in those last moments, but noticed through one of the weird new senses Dr. Cortázar had given him that the pot had already gone cold. The awareness of molecular vibration was analogous to the physical sensation of heat—it measured the same material reality—but the merely human sense was like a child playing a whistle compared with Duarte's vast, symphonic new awareness.

The last moment came.

In the instant between deciding to call his valet for a fresh pot of tea and then reaching his hand out for the comm controls, the mind of Winston Duarte blew apart like a pile of straw in a hurricane.

There was pain—a great deal of pain—and there was fear. But there wasn't anyone left to feel it, so it faded quickly. There was no consciousness, no pattern, no one to think the thoughts that swelled and dimmed. Something more delicate—more graceful, more sophisticated—would have died. The narrative chain that thought of itself as Winston Duarte was ripped to pieces, but the flesh that housed him wasn't. The subtle flows of energy in his body fell into a storm of invisible turbulence, whipped past coherence. And then, without anyone being aware of it, they began to slow and still.

His thirty trillion cells still took in oxygen from the complex fluid that had been his blood. Those structures that were his neurons fell into association with each other like drinking buddies bending their elbows in unconscious synchrony. Something was that hadn't been. Not the old thing, but a pattern that took up residence in the empty space it left behind. Not the dancer, but a dance. Not the water, but a whirlpool. Not a person. Not a mind. But something.

When awareness returned, it first appeared in colors. Blue, but without the words for blueness. Then red. Then a white that also meant something. The fragment of an idea. Snow.

Joy came to be, and it lasted longer than fear had. A deep, bubbling sense of wonder carried itself along without anything to carry it. Patterns rose and fell, came together and came apart. The few that fell apart more slowly sometimes came into relationship with each other, and sometimes that made them last even longer.

Like a baby slowly mapping touch and sight and kinesthesia into something not yet called “foot,” scraps of awareness touched the universe and something like understanding began to form. Something felt its own lumbering, brute physicality as it pushed chemicals into the vast gaps between cells. It felt the raw, open vibration that surrounded the ring gates that connected the worlds, and it thought of sores and ulcerations. It felt something. It thought something. It remembered how to remember, and then it forgot.

There had been a reason, a goal. Something had justified atrocities in order to avoid worse ones. He had betrayed his nation. He had conspired against billions. He had condemned people who were loyal to him to death. There had been a reason. He remembered it. He forgot. He rediscovered the glorious brilliance of yellow and devoted himself to the pure experience of that.

He heard voices as symphonies. He heard them as quacks. He was surprised to find that a he existed and that it was him. There was something he was supposed to do. Save humanity. Something ridiculously grand like that.

He forgot.

Come back. Daddy, come back to me.

Like when she’d been a baby and he had slept at her side, he refocused on her by habit. His daughter mewled, and he roused himself so that his wife wouldn’t have to. His hand was in hers. She’d said something. He couldn’t remember the words, so he looked backward in time to where she spoke them. *Dr. Cortázar? He’s going to kill me.*

That didn’t seem right. He didn’t know why. The storm in the other place was loud and soft and loud. That was connected. He was supposed to save them from the things in the storm, that *were* the storm. Or from their own too-human nature. But his daughter was there, and she was interesting. He could see the distress flowing through her brain, through her body. The pain in her blood scented the air around her, and he wanted. He wanted to soothe her, to comfort her. He wanted to make right everything that was wrong for her. But more interesting, for the first time, he *wanted*.

The strange sensation of feeling these things plucked at his attention, and his focus drifted. He held her hand and wandered. When he came back, he was still holding her hand, but she was someone else. *We just need to*

scan you, sir. It won't hurt.

He remembered Dr. Cortázar. *He's going to kill me.* He waved Cortázar away, pushing at the empty spaces between the tiny motes that made him a physical thing until the man swirled like dust. There. That was fixed. But the effort tired him and made his body ache. He gave himself permission to drift, but even so, he noticed that the drift was less. His nervous system was shattered, but it kept growing together. His body kept insisting that even if it couldn't go on, it could go on. He admired this stubborn refusal to die as if it were something outside of himself. The sheer mindless and physical impulse to move forward, each cell's determination to churn along, the obdurate need to continue existing that didn't even require a will. All of it meant something. It was important. He just had to remember how. It had to do with his daughter. It had to do with keeping her safe and well.

He remembered. He remembered being a man who loved his child, and so he remembered being a man. And that was a stronger rope than the ambition that had built an empire. He remembered that he had made himself something different than a human. Something more. And he understood how this alien strength had also weakened him. How the brutish and unapologetic clay of his body had kept him from annihilation. The sword that slew a billion angels had only inconvenienced the primates in their bubbles of metal and air. And a man named Winston Duarte, halfway between angel and ape, had been broken but not killed. The shards had found their own way.

There was someone else too. A man with dry riverbeds in his mind. Another man who had been changed. James Holden, the enemy who had shared his enemy, back before Winston Duarte had broken, and in breaking, become.

With infinite effort and care, he pulled the unbearable vastness and complexity of his awareness in and in and in, compressing himself into what he had been. The blue faded into the color he had known as a man. The sense of the storm raging just on the other side, of the violence and threat, faded. He felt the warm, iron-smelling meat of his hand, holding nothing. He opened his eyes, turned to the comm controls, and opened a connection.

"Kelly," he said. "Could you bring me a fresh pot of tea?"

The pause was less than might have been expected, under the

circumstances. “Yes, sir,” Kelly said.

“Thank you.” Duarte dropped the connection.

A medical bed had been put in his study with an aerated foam mattress to prevent bedsores, but he was seated at his desk as if he had never left it. He took stock of his body, noticing its weakness. The thinness of its muscles. He stood, clasped his hands behind him, and walked to the window to see whether he could. He could.

Outside, a light, tapping rain was falling. There were puddles on the walkways and the grass was bright and clean. He reached out for Teresa, and he found her. She wasn’t nearby, but she wasn’t in distress. It was like watching her traipse through the wilds again, only without the artificial lens of the cameras. His love and indulgence for her was vast. Oceanic. But it wasn’t pressing. The truest expression of his love was his work, and so he turned to it as if this were any other day.

Duarte pulled up an executive summary the way he had at the start of every morning. Normally it was a page long. This one was a full volume. He sorted by category, pulling out the thread that addressed the status of traffic through the ring space.

Things had, putting it mildly, gone poorly in his absence. Scientific reports of the loss of Medina Station and the *Typhoon*. Military analyses of the siege of Laconia, the loss of the construction platforms. Intelligence summaries of the growing opposition in the widely scattered systems of humanity, and of Admiral Trejo’s attempts to hold the dream of the empire together without him.

There had been a time not long after her mother passed when Teresa had decided to make him breakfast. She had been so young, so incapable, that she had failed. He remembered the crust of bread heaping with jam and a pat of unmelted butter perched on top of it. The combination of ambition and affection and pathos had been beautiful in its way. It was the kind of memory that survived because the love and the embarrassment fit together so perfectly. This felt the same.

His awareness of the ring space was clear now. He could hear the echoes of it in the fabric of reality like he was pressing his ear to a ship’s deck to know the status of its drive. The rage of the enemy was as apparent to him now as if he could hear its voices. The shrieks that tore something that wasn’t air in something that wasn’t time.

“Admiral Trejo,” he said, and Anton startled.

It was the fifth week of Trejo’s combination press tour and reconquest of Sol system. He sat in his cabin, spent from his long day of glad-handing and speech-making with the local leaders and officials. He was the visible face of a nearly toppled empire, making sure no one knew how close he’d come to losing it all. After the hard weeks-long burn out from Laconia, it was exhausting. He wanted nothing more than a stiff drink and eight hours in his bed. Or twenty. Instead, he was on a video call with Secretary-General Duchet and his Martian counterpart, both of them on Luna and near enough that light delay didn’t interfere. The politicians were lying through their smiles. Trejo was threatening through his.

“Of course we understand the necessity of getting the orbital shipyards up and running as quickly as possible. Rebuilding our shared defenses is critical,” Duchet said. “But given the lawlessness that has followed the recent attack on Laconia, our first concern is security for the facilities. We have to have some guarantee that your ships will be able to protect these valuable assets. We don’t want to just paint a target on ourselves for the underground to aim at.”

You just got the shit kicked out of you, had your factories blown up, lost two of your most powerful battleships, and are scrambling to hold the empire together. Do you have enough ships to force us to work for you?

“We’ve suffered setbacks, that’s true,” Trejo drawled, the way he sometimes did when he was angry. “But there’s no need for concern. We have more than enough of the *Pulsar*-class destroyers to provide total security for Sol system.”

I just reconquered you with two dozen of those ships, and I have a shit-ton more of them I can call in if I need to, so fucking do what I tell you to do.

“Excellent to hear that,” the Martian prime minister said. “Please let the high consul know we will spare no effort to meet his production schedule.”

Please don't carpet-bomb our cities.

"I will let him know," Trejo replied. "The high consul treasures your support and loyalty."

Duarte is a drooling moron, but if you give me the ships to hold the empire together, I won't have to glass your damn planets, and maybe we all win.

Trejo killed the connection and leaned back in his chair. The bottle of whiskey in his cabinet called to him gently. The freshly made bed was much louder. He had time for neither. The underground was still running riot in thirteen hundred systems and more. And that was just his human problem. After that, there were the gates to deal with, and whatever within them kept turning the minds off in whole systems at a time as it sniffed for ways to exterminate humanity.

No rest for the wicked. No peace for the good.

"Connect me to the Association of Worlds rep, Sol system. I don't remember her name," he said. No one heard him but the ship.

CONNECTING NOW flashed on his screen. Time for more smiling lies. More veiled threats. More—and he used the word as an epithet—diplomacy.

"Admiral Trejo," said a voice from behind him. It was familiar but so unexpected that his mind scrambled to place it. He had a brief, irrational idea that his attaché had been hiding in his room this whole time and had only just now chosen to reveal himself.

"Anton," the voice said, lower and as intimate as a friend. Trejo turned around in his chair to face the room. Winston Duarte stood near the foot of his bed, hands behind his back. He wore a loose casual shirt and black trousers. He wasn't wearing any shoes. His hair was mussed, as if he'd only recently woken up. He looked like he was actually there.

"Security alert," Trejo said. "This room. Full sweep."

Duarte looked pained. "Anton," he said again.

In milliseconds, the ship had swept every inch of his cabin looking for anyone or anything that wasn't supposed to be there. His screen reported to him that the room was free of listening devices, dangerous chemicals, unauthorized technology. He was also the only person in it. The ship asked if he wanted armed security personnel to respond.

“Am I having a stroke?” he asked the apparition.

“No,” Duarte said. “Though you should probably be getting more sleep.” The ghost in his room shrugged its shoulders, almost apologetically. “Look. Anton. You’ve done everything that could have been asked of you to hold the empire together. I’ve seen the reports. I know how difficult this job has been.”

“You’re not here,” Trejo said, asserting the only possible reality against the lies his senses were telling him.

“What *here* means has become strangely flexible for me,” Duarte agreed. “As much as I appreciate your work, you can stand down now.”

“No. It’s not over. I’m *still* fighting to hold the empire together.”

“And I appreciate that. I do. But we’ve been running down the wrong road. I need a little quiet to think this through, but I see things better now. It’s going to be all right.”

The need to hear those words—to believe them—rushed through Trejo like a flood. The first time a lover had kissed him, it had been less overwhelming than this.

Duarte shook an amused and melancholy smile. “We built an empire that spanned the galaxy, you and I. Who’d have imagined we were thinking too small?”

The image, illusion, projection, whatever it was, vanished so suddenly it was like a skipped frame in a film.

“Fuck me,” Trejo said to no one. The security alert was still flashing on the screen over his desk. He slapped the comm link with one hand.

“Sir,” the duty officer said. “We’ve got an active alert from your quarters. Do you want—”

“You have five minutes to prep for a max burn to the ring.”

“Sir?”

“Sound the alarm,” Trejo said. “And get everyone in their couches. We have to get back to Laconia. Now.”

Chapter One: Jim

It pinged us,” Alex said. His voice was a light almost singsong that meant he thought they were screwed.

Jim, sitting on the ops deck with a tactical map of Kronos system on the screen and his heart going double time, tried to disagree. “Just because he’s knocking doesn’t mean he knows who’s home. Let’s keep acting like what we’re acting like.”

The *Rocinante* was acting like a small-haul freighter, a class of ship thick on the ground in Kronos system. Naomi had tuned the Epstein to run just dirty enough to change their drive signature without generating too much extra waste heat. A set of extra plating welded to their hull at an underground shipyard in Harris system had altered their silhouette. A slow dribble of liquid hydrogen was pumping out across the top of the ship and changing their thermal profile. When Naomi had gone over the plan to layer on camouflage, it had seemed comprehensive. It was only the threat of violence that made Jim feel exposed.

The enemy frigate was called the *Black Kite*. Smaller than the *Storm*-class destroyers, it was still well armed and had the self-healing outer hull that made Laconian ships hard to kill. It was part of a hunting group scouring all the inhabited systems for Teresa Duarte, runaway daughter of High Consul Winston Duarte, heir apparent to his empire, and, for the time being, apprentice mechanic on the *Rocinante*.

This wasn’t the first time they’d seen it.

“Any follow-up?” Jim asked.

“Just the ladar ping,” Alex said. “Think I should warm up the peashooter, just in case?”

Yeah, let’s do that was on the edge of Jim’s mind when Naomi’s voice answered instead. “No. There’s some evidence that their next-generation sensor arrays can recognize rail-gun capacitors.”

“That feels unfair,” Jim said. “What a crew does with its rail-gun capacitor in the privacy of its own ship shouldn’t be anyone else’s business.”

He could hear the smile in Naomi’s voice. “While I agree in principle, let’s keep the guns offline until we need them.”

“Copy that,” Alex said.

“Still no follow-up?” Jim asked, even though he had access to all the same logs Alex did. Alex checked anyway.

“Comms are dark.”

Kronos wasn’t quite a dead system, but it was close. The star there was large and fast-burning. There had been a habitable planet in the goldilocks zone there at one point—at least enough that the protomolecule had been able to hijack the biomass needed to build a ring gate. But in the strange eons since the gate’s formation and humanity’s stumbling into the alien ruins, the goldilocks zone had moved. The original life-bearing planet hadn’t quite been engulfed by the star yet, but its oceans had been boiled to nothing and its atmosphere stripped away. The only native life in Kronos was on the wet moon of an outlying gas giant, and that wasn’t much more than viciously competing continent-sized sheets of slime mold.

The human inhabitants of Kronos were around ten thousand miners on seven hundred thirty-two active sites. Corporations, government-sponsored interest groups, independent rock hoppers, and unholy legal hybrids of all three were stripping palladium out of a nicely rich scattering of asteroids and sending it out to anyone still building air recyclers or working on adjustment-terraforming projects.

Which was everyone.

Kronos had been the edge of the Transport Union’s reach back in the day, then the ass end of the Laconian Empire, and now no one really knew what it was. There were hundreds of systems like it, all through the gate network: places that either weren’t self-sufficient yet or didn’t plan to be, more focused on digging out their own little economic niche than any broader coalition. The kinds of places where the underground could usually hide and repair their ships and plan for what came next. On the tactical map, asteroids marked by orbit, survey status, composition, and legal ownership swirled around the angry star as thick as pollen in springtime. The ships were clumped around the excavation and survey sites by the

dozen, and as many more were on lonely transits from one little outpost to another or on errands to gather water for reaction mass and radiation shielding.

The *Black Kite* had come through the ring gate three days before, torpedoed the underground's radio repeater at the surface of the gate, and then burned gently to remain in place like a bouncer at a pretentious nightclub. The ring gates didn't orbit the stars so much as remain in fixed position as though they'd been hung on hooks in the vacuum. It wasn't the strangest thing about them. Jim had let himself hope that blowing up the underground's pirate transmitter would be all the *Kite* did. That the enemy would finish its little vandalism and fuck off to cut the metaphorical telegraph wires on some other system.

It had stayed, scanning the system. Looking for them. For Teresa. For Naomi, functional leader of the underground. And for him.

The comm display lit up the green of an incoming transmission, and Jim's gut knotted. At their present range, the battle wouldn't come for hours, but the rush of adrenaline was like someone had fired a gun. The fear was so present and overwhelming that he didn't notice anything odd.

"Broadcast," Alex said over the ship comms and from the deck above Jim. "Weird it's not a tightbeam... I don't think he's talking to us."

Jim opened the channel.

The woman's voice had a clipped, emotionless formality that was like the accent of the Laconian military. "... as offensive action and treated as such. Message repeats. This is the *Black Kite* to registered freighter *Perishable Harvest*. By order of Laconian security forces, you will cut your drive and prepare for boarding and inspection. Refusal to comply will be viewed as an offensive action and treated as such. Message repeats..."

Jim filtered the tactical map. The *Perishable Harvest* was about thirty degrees spinward of the *Roci*, and burning toward the wide, angry sun. If they'd gotten the message, they hadn't complied with it yet.

"Is that one of ours?" Jim asked.

"Nope," Naomi said. "It's listed as property of a David Calrassi out of Bara Gaon. I don't know anything about it."

With light delay, they should have received the *Black Kite*'s command ten minutes before the *Rocinante* did. Jim imagined some other crew in a panic because they'd received the message he'd been dreading. Whatever

happened next, the *Rocinante* was out of the crosshairs for the moment at least. He wished he could feel the relief a little more deeply.

Jim unstrapped from the crash couch and swung around. The bearings hissed as it shifted under his weight.

“I’m heading down to the galley for a minute,” he said.

“Grab a coffee for me too,” Alex said.

“Oh no. Not coffee. I’m maybe up to some chamomile or warm milk. Something soothing and unaggressive.”

“Sounds good,” Alex said. “When you change your mind and get some coffee, grab one for me too.”

On the lift, Jim leaned against the wall and waited for his heart to stop racing. This was how heart attacks came, wasn’t it? A pulse that started fast and then never slowed until something critical popped. That was probably wrong, but it felt that way. He felt that way all the time.

It was getting better. Easier. The autodoc had been able to supervise the regrowth of his missing teeth. Apart from the indignity of needing to numb his gums like a toddler, that had gone well enough. The nightmares were old acquaintances by now. He’d started having them on Laconia while still a prisoner of High Consul Duarte. He’d expected them to fade once he was free, but they were getting worse. Being buried alive was the most recent version. More often it was someone he loved being murdered in the next room and not being able to key in the lock code fast enough to save them. Or having a parasite living under his skin and trying to find a way to cut it out. Or the guards on Laconia coming to beat him until his teeth broke again. The way that they had.

On the upside, the old dreams about forgetting to put on his clothes or not studying for a test seemed to be off the rotation. His weirdly vindictive dream life wasn’t all bad.

There were still days when he couldn’t shake the sense of threat. Sometimes a part of his mind would get trapped in the unfounded and irrational certainty that his Laconian torture team was about to find him again. Others, it was the less irrational dread of the things beyond the gates. The apocalypse that had destroyed the protomolecule’s makers and was on the path to destroying humanity.

Seen in that light, maybe he wasn’t the broken part of the equation. Maybe the larger situation was bad enough that feeling as whole and sane

as the man he'd been before his Laconian imprisonment would have been a sign of madness. Still, he wished he could tell whether the waves of shuddering were a resonance effect of running the drive dirty or if it was just him.

The lift stopped, and he stepped out, turning toward the galley. The soft, rhythmic thump of dog tail against deck told him Teresa and Muskrat were already there. Amos—black-eyed, gray-skinned, and back from the dead—was there too, sitting at the table with the same placeholder smile he'd always had. Jim hadn't seen him shot in the head back on Laconia, but he knew about the drones that had taken the pieces of human flesh and reconnected them. Naomi still struggled with whether the thing that called itself Amos really was the mechanic they'd shipped with for so many years, or if he'd become an alien mechanism that only thought it was Amos because it was made from his body and brain. Jim had decided that even if he looked different, even if he sometimes knew things that were scraps of the ancient alien world, Amos was Amos. He didn't have the spare energy to think about it more deeply than that.

Besides which, the dog liked him. Not a perfect critical guide, but probably the least imperfect.

Muskrat, sitting at Teresa's feet, looked up at Jim hopefully and wagged her tail against the deck again.

"I don't have any sausage," Jim said to the expressive brown eyes. "You'll have to make do with kibble like the rest of us."

"You spoiled her," Teresa said. "She's never letting you forget that."

"If I go to heaven, let it be for spoiling dogs and children," Jim said, and headed for the dispenser. Without thinking, he keyed in a bulb of coffee. Then, realizing what he'd done, he added one for Alex.

Teresa Duarte shrugged and turned her attention back to the tube of mushroom, flavorings, and digestive fiber that was her breakfast. Her hair was pulled back in a dark ponytail, and her mouth had a permanent slight frown that was either a quirk of her physiology or her character. Jim had seen her grow from a precocious child to a rebellious adolescent in the State Building in Laconia. She was fifteen now, and it was sobering to remember who he'd been at her age: a thin, dark-haired Montana boy with no particular ambitions beyond the knowledge that if nothing else worked out, he could join the navy. Teresa seemed older than adolescent Jim had been,

both more knowledgeable about the universe and angrier with it. Maybe the two went hand in hand.

She'd been afraid of him when he'd been her father's prisoner. Now that she was on Jim's ship, the fear seemed to have evaporated. He'd been her enemy then, but he wasn't sure that he was her friend now. The emotional complexity of an adolescent girl socialized in isolation was probably more than he could ever really understand.

The dispenser finished both his bulb and Alex's, and Jim took them, appreciating the warmth against his palms. The shuddering was almost gone now, and the bitterness of the coffee was more calming than tea would have been.

"We're going to need a resupply before much longer," Amos said.

"Really?"

"We're okay on water, but we could stand to re-up the fuel pellets. And the recyclers ain't what they used to be."

"How bad?"

"We're solid for a few weeks yet," Amos said.

Jim nodded. His first impulse was to dismiss it as a problem for another day. That was wrong, though. Fuck-it-if-it's-not-happening-right-now was crisis thinking, and if he couldn't break out of it, it would only lead to more crises later on.

"I'll talk to Naomi," he said. "We'll figure something out." *Assuming the Laconians don't find us. Assuming the gate entities don't kill us. Assuming that any of the thousand other catastrophes I haven't even thought of don't kill us all before it matters.* He took another sip of his coffee.

"How're you doing, Cap'n?" Amos asked. "You seem a little twitchy."

"Fine," Jim said. "Just covering near-constant panic with light humor, same as anyone."

Amos had a moment of eerie stillness—one of the hallmarks of his new self—and then smiled a little wider. "All right then."

Alex broke in over the ship comms. "We got something."

"Something good?"

"Something," Alex said. "The *Perishable Harvest* just dumped some kind of liquid, and it's burning like hell for the big trade station in the outer Belt."

"Copy that," Naomi said—also over the comms—in the new staccato

calm that Jim thought of as her Commander Nagata voice. "Confirming."

"The *Black Kite*?" Jim asked the wall.

Alex and Naomi were silent for a moment, then Alex said, "Looks like they're going after them."

"Moving away from the ring gate?"

"Yes indeed," Alex said, and the pleasure in his voice was unmistakable.

Jim felt a surge of relief, but it didn't last more than a moment. He was already thinking about the ways it might be a trap. If the *Roci* turned toward the ring too soon, it would draw attention to them. Even if the *Roci* evaded the *Black Kite*, there might be another Laconian ship risking itself by waiting inside the ring space, ready to intercept any ship fleeing the system.

"Why are they running?" Teresa asked. "They don't think they're going to get away, do they? Because that would be stupid."

"They aren't trying to save the ship," Amos said. He had the same patient, almost philosophical tone as when he was walking her through how to do a good weld in microgravity or checking the seal on a pipe. It was the voice of a teacher walking his student through a lesson in how the world worked. "Whatever they had on that ship that Laconia was going to get pissed about, they can't hide it. Not in a system as thin as this one. And there's no way they're slipping off and swapping transponders, so their ship's fucked. The trade station's big enough they can maybe get the crew off and sneak onto other ships or pretend they were on the station all along."

"Running to where the hiding places are," Teresa said.

"And the more lead time they have, the better the chances they can find a good spot," Amos said.

That could be us, Jim thought. *If the Black Kite had decided that we looked a little sketchier than the Perishable Harvest, we would be sacrificing the Roci and hoping we could get small enough to overlook.* Only it wasn't true. There was no hiding place in Kronos or anywhere small enough that Laconia wouldn't look there. Plain sight was their best hope, because their plan B was violence.

He didn't think he'd said anything aloud or made any kind of noise that would show his distress, but maybe he had, because Teresa looked at him with something between annoyance and sympathy. "You know I won't let them hurt you."

"I know that you'll try," Jim said.

"I'm still the daughter of the high consul," she said. "I've gotten you out of trouble before."

"I'm not leaning on that trick," Jim said, more harshly than he'd intended. Muskrat shifted, hauled herself up to standing, and looked from Jim to Teresa and back in distress. Teresa's eyes hardened.

"I think what the captain's saying," Amos said, "is that using you as a meat shield isn't something he's a hundred percent comfortable with. It's not that you wouldn't do it, since you already did. But the people on the other end of that gun? We don't know them, they may not be the most reliable, and the less we have to count on them, the better."

Teresa scowled, but less.

"Yes," Jim said. "That was much more eloquent."

"Sometimes I'm good that way," Amos said, and it might have been a joke or it might not. "You want us to get the ship ready to rabbit? We've got enough reaction mass for a decent burn."

"I thought we needed fuel pellets."

"We do, but we can spend 'em getting out of Kronos, put water on the grocery list, and call it good. Recyclers are really going to be our limiting factor."

The pull of the thought was stronger than gravity. Light the drive, put nose toward the ring gate, and get the hell out before the enemy could get hold of them. Jim intentionally loosened his grip on the bulbs. "Naomi. What do you think?"

A moment of silence, then, "Sorry. I wasn't listening. What was the question?"

"Should we prep the *Roci* for a mad dash out of here? As soon as the *Black Kite*'s fully committed to its burn, we could make a break."

"No," she said, the way he had known she would. "They haven't identified us. If we go too soon, it'll only make them suspicious. Better if we look like bystanders. Alex? Plot an intercept with the *Whiteoak*. It's the big ice hauler at the second gas giant."

"Got her," Alex said.

Amos shifted on his bench. "Captain?"

"I'm fine."

"If we need to run," Naomi said, "we'll run."

We'll always need to run. We'll never get to rest, Jim thought. There didn't seem like any point in saying it.

Chapter Two: Tanaka

Aliana pressed the button on her vaporizer and inhaled deeply. The mist tasted like vanilla and hit her lungs like a soft warm cloud. Nicotine and tetrahydrocannabinol mixed with just a touch of something more exotic. Something that tempered the THC sleepiness with a vivid hyperawareness. The shades in her room were drawn, but the hint of light at the edges shifted the dust into a rainbow of sparks. She moved one leg, and the silk sheet caressed it like a thousand tiny lovers.

Tristan was asleep next to her, his small muscular butt pressed up against her thigh. He snored gently as he slept, punctuated by the occasional twitch and sigh. Aliana knew that she found the noise charming and sweet because she was high and postcoital. The minute his snoring became annoying, Tristan would have overstayed his welcome.

There were, in her experience, two ways to thrive in a rigid, authoritarian regime. The first—the one most people reached for—was to be what power wanted you to be. Mars had wanted loyal soldiers, and they had produced them like they were printing machine parts. She knew, because she was old enough that she'd been one of them. She'd seen her cohort try to strangle or excise from their collective souls anything that wasn't sufficiently Martian, and sometimes they'd managed.

The other mode of survival was to enjoy having secrets. Enjoy the power of seeming to be one thing while being another. And then be good at it. Even when it didn't involve fucking her junior officers, it was a kind of sexual perversion. The thrill of knowing that a wrong word or an unexpected slip could put a bullet in the back of her head was more important to her than the actual sex.

A permissive, open society where she could have done all the same things without fear of consequences would have driven her crazy. She'd loved being part of the Laconian experiment from the beginning because

Duarte's vision—first as a capital offense against Mars and then as a permanent engine of danger—fed her kinks. She felt no shame about that. She knew what she was.

"Wake up," she said, pushing her fingers into the young man's back.

"Sleeping," Tristan slurred at her.

"I know. Now wake up." She jabbed him again. She spent ten hours a week boxing and wrestling. When she stiffened her fingers, they were like iron bars.

"God dammit," Tristan said, then rolled over. He gave her a sleepy grin. His tousled blond hair and clean-shaven face with its deep dimples made him look like a cherub in a classical painting. One of Raphael's putti.

Aliana took another hit off the vaporizer and offered it to him. He shook his head. "Why'd you wake me?"

Aliana stretched luxuriously under the soft sheets, her long frame barely contained by the oversized bed. "I'm high. I want to fuck."

Tristan flopped onto his back with an exaggerated sigh. "Allie, I barely have any fluid left in my body."

"Then go get a glass of water, take a salt pill, and get your ass back into my bed."

"Aye, aye, Colonel," Tristan said, laughing.

The laugh ended in a sharp *oof* when she rolled over on top of him and slammed down onto his belly, locking his thighs to the bed with her ankles and feet, and gripping his wrists in her hands. He looked up at her with surprise, then thinking it was sex play, started to struggle. His arms and chest were well formed but soft, more like a healthy teenager's than a man in his twenties. Her arms were thin and ropy, the muscles of a long-distance runner, burned down to their essence through constant hard use, and strong as steel springs. When he tried to move, she easily shoved him back down, squeezing her hands until his wrists popped and he squealed.

"Allie, you're—" he started, but she squeezed again and he shut up. She was angry, and he saw it. She liked that she was angry. She liked that he saw it.

"In this room, I am Aliana. You are Tristan," she said, speaking slowly, making sure the drugs weren't slurring her words. "Outside that door, you are Corporal Reeves, and I am Colonel Tanaka. Those things can never be confused for us."

“I know,” Tristan said. “I was just kidding.”

“No kidding. No jokes. No slipups. If you make a mistake, if you forget the strict discipline that allows this to exist, I will at minimum be dishonorably discharged.”

“I’d never—”

“And you,” Aliana continued as if he hadn’t spoken, “will not like the version of me that comes calling on you then.”

She stared down at him for a moment, waiting until his sudden fear turned into understanding. Then she let go of his wrists and climbed off of him, lying back down on her side of the bed.

“Get me some water too, would you?” she said.

Tristan didn’t answer, just got up and left the room. Aliana watched him go, enjoying the clenching of his thighs and ass as he walked, the gentle V of his back and shoulders. He was very, very pretty. When the thing they had inevitably ended, she was going to miss him. But that didn’t change the fact that it would end. They always had before. That was part of the joy.

A few moments later, Tristan returned carrying two glasses of water. He paused at the foot of the bed, looking unsure. Aliana patted the sheets next to her.

“I’m sorry if I hurt you,” she said.

“It’s okay,” he replied, then handed her a glass and sat down next to her. “I’m sorry I slipped up. Still want to fuck?”

“In a minute,” she said. They both gulped water for a while.

“Will I see you again?” he eventually asked. Aliana found herself gratified by the hopefulness in his voice.

“I should be on Laconia for a while this time,” she replied. “And I do want to see you again. We just have to be careful.”

“I understand,” he said. And she knew he did. She liked her toys to be much younger and much lower rank. It kept things simpler that way. But she didn’t waste her time with stupid men.

Her thirst gone, the warmth in her lungs was spreading down to her belly in a very pleasant way. She reached over and put her hand on Tristan’s thigh. “I think we should—”

The handheld on her nightstand chimed. She’d set it to do-not-disturb, which meant the device thought the incoming call was important enough to ignore that. She’d had it a long time and trained it well, so it was probably

right. She lifted it to check the connection request. It was coming from the State Building. She accepted the connection without visual. “Colonel Tanaka here.” Tristan slid out of bed and reached for his pants.

“Good afternoon, Colonel. This is Lieutenant Sanchez with scheduling and logistics. You have a debriefing at the State Building in two hours.”

“First I’ve heard of it,” she said, reaching for the side table and her sobriety meds. “Can you tell me the agenda?”

“I’m sorry, Colonel. I don’t have access to that. You were added to the attendees by Admiral Milan.”

The party was over.

When she reached the State Building, a light rain was falling. Tiny droplets turned the paving dark and shiny at the same time. The low mountain at the edge of the grounds looked like something from an ancient ukiyo-e print. Yoshitoshi or Hiroshige. An attaché from the Science Directorate was waiting to meet her with a cup of coffee and an umbrella. She waved both away.

Tanaka knew her way around the State Building. Most of her assignments were in the field, but she’d made enough friends and professional connections in the highest ranks of power that when she was on Laconia, she was often here. She hadn’t been back since the siege of Laconia, the destruction of the construction platform, and the maybe-kidnapping, maybe-autoemancipation of Teresa Duarte. There weren’t any physical changes to the building. The poured concrete was as solid as ever, the cut flowers in the vases as fresh. The guards in their razor-pressed uniforms were as stolid and calm. And everything felt fragile.

The attaché guided her to an office she’d been in before. Yellow walls of domestic wood with the blue seal of Laconia worked into them, and two austere sofas. Admiral Milan—acting commander in chief while the high consul was in seclusion and Admiral Trejo was in Sol system—sat at a wide desk. He was a broad man, with a heavy face and salt-and-pepper hair

shaved tight. And a crusty old sailor from the Mars days, impatient with bullshit and quick-tempered as a badger. Tanaka liked him immensely.

At one sofa, a lieutenant with a signal intelligence insignia on the standard Laconian blue naval uniform stood. Beside him, Dr. Ochida of the Science Directorate sat with his hands on his knee, fingers laced together. The silence had the awkwardness of an interruption.

Admiral Milan was the first to speak. “We’re running a little long here, Colonel. Have a seat. We’ll be done soon.”

“Yes, sir,” Tanaka said, and took the other sofa for herself. Admiral Milan looked to the standing lieutenant—Rossif, to judge by his nametag—and drew a circle in the air with his fingertip. *Get on with it.*

“Gedara system. Population just shy of two hundred thousand. High concentration of fissionables in the upper crust, so they’ve been trying to get deep-crust mining operations going for the last several years. Agriculture exists but it’s a decade away from self-sustaining.”

“And the incursion?” Admiral Milan said.

“Twenty-three minutes, eleven seconds,” Rossif answered. “Total loss of consciousness. Some accidental fatalities, some damage to infrastructure. Mostly people crashing vehicles or falling off of things. And logs show that just seconds before the incursion, two unscheduled heavy freighters passed through the ring and went dutchman.”

Dr. Ochida cleared his throat. “There was something strange this time.”

“Something stranger than everyone’s brain shutting off for twenty minutes?” Admiral Milan said.

“Yes, Admiral,” Ochida answered. “A review of instrumentation during the event shows a different kind of time loss as well.”

“Explain.”

“Short version,” Ochida said, “light went faster.”

Admiral Milan scratched his neck. “Did the word *explain* change meanings and no one told me?” Tanaka suppressed a smile.

“Simply put, the speed of light is a function of basic properties of the universe. Call it... the fastest causality can propagate in vacuum,” Ochida said. “For twenty-some minutes in the Gedara system, the nature of space-time shifted in a way that altered the speed of light. Made it faster. The light delay from the ships at the Gedara ring to the planet at the time was slightly less than forty minutes. Logs of the event show that during the incursion, it

decreased by nearly four thousand nanoseconds.”

“Four thousand nanoseconds,” Milan said.

“The nature of space-time *changed* in that system for twenty minutes,” Ochida intoned, then waited for a reaction he wasn’t getting. He looked crestfallen.

“Well,” Milan said. “I will certainly have to think about this. Thank you for the briefing, Lieutenant. Doctor. You’re both dismissed. You stay, Colonel.”

“Yes, sir,” Tanaka replied.

Once the room was empty, Milan leaned back. “Drink? I’ve got water, coffee, bourbon, and some herbal tea shit my husbands both drink, tastes like grass clippings.”

“Am I on active duty?”

“I don’t think you need to concern yourself with breaking protocol, if that’s what you mean.”

“Then bourbon sounds great, sir,” Tanaka replied. Admiral Milan spent a minute fussing at his desk, then came back with a cut crystal glass and two fingers of smoky brown liquid swirling in it.

“To your health,” Tanaka said, then took a sip.

“So,” Milan said, and sat with the unconscious grunt of an old man with a lot of bad joints. “What do you think that lightspeed shit means?”

“Not a clue, sir. I’m a shooter, not an egghead.”

“This is why I’ve always liked you,” he said, then sat back in his chair, steepling his fingers. The silence was different this time, and she wasn’t certain what it meant. “So just between the two of us—one old sailor to another—is there anything you want to tell me?”

She felt the adrenaline hit her bloodstream. She didn’t let it show. She was too practiced at deception for that. “I don’t know what you mean.”

He tilted his head and sighed. “I don’t either. I find this whole thing pretty fucking mysterious. And I’m not as good at swallowing my curiosity as I was when we were young.”

“Still genuinely unclear what we’re talking about. Was someone supposed to tell me why you wanted me here?”

“It wasn’t me that wanted you. Trejo made the request, and he had me do a little paperwork on your behalf.” He pulled out a physical folder of red paper with a silver string to close it, and handed it to her. It seemed so out

of place, it was like being handed a stone tablet. She drank the rest of her bourbon off in one shot before she took it. It was lighter than she expected, and the string came undone easily. Inside was a single sheet of three-layer security parchment, the document verification circuits crisp as lace. Her picture was on it and her biometric profile, her name and rank and identification record numbers. And a short passage granting her Omega status from the Laconian Intelligence Directorate at the personal request of the High Consul's Office.

If it had been a severed head, she wouldn't have been more surprised.

"Is this..." she began.

"Not a joke. Admiral Trejo has instructed that you be given the keys to the kingdom. Override authority on any mission. Access to any information, regardless of security classification. Immunity from censure or prosecution for the duration of your deployment. Pretty sweet. You really telling me you don't know what it's about?"

"I assume there's a mission?"

"Probably, but I'm not cleared to know what it is. You just keep your seat. I can show myself out."

When Admiral Milan closed the door behind him, the office system threw a comm message on the wall screen. After a moment, Admiral Trejo appeared. She'd known him for as long as she'd known anyone living. His eyes were still the same uncanny green, but now there were dark bags under them. His hair was thinning and his skin had an unhealthy waxy shine. He looked haunted.

"Colonel Tanaka," he said. "I'm reaching out to you with a critical mission for the empire. At present, I am taking a break from a hard burn from Sol system, and if this could wait until I arrived on Laconia, I'd brief you in person. It can't, so this will have to do."

She stared into her bourbon glass. It was empty, and the bottle sat just a meter away, but suddenly she didn't want it anymore. She felt her attention sharpening.

"I'm sure that you, like everyone else in the empire, are wondering what exactly the high consul has been doing in seclusion. How he has been spearheading the fight against the forces that are threatening us from within the gates. I know there's been some speculation that he was somehow injured or incapacitated. So, candidly, I need you to know that when I left

for Sol system, the high consul was a drooling, brain-damaged moron who couldn't feed himself or wipe his own ass. He has been that way since the attack that destroyed the *Typhoon* and Medina Station."

Tanaka took a deep breath and let it out through her teeth.

"Dr. Cortázar had altered the high consul's biology considerably by using modified protomolecule technologies. It left the high consul in possession of certain... abilities that were not fully documented or explored before Dr. Cortázar's death. And in fact, Duarte killed him. Waved his hand and splattered that crazy fucker across half a room. I've never seen anything like it. Right now, the only people who know this are you, me, Dr. Okoye of the Science Directorate, and Teresa Duarte, who ran away with the underground's assault forces after they cleaned our clock. So, pretty much the whole fucking enemy.

"Given that for background, you'll understand how confused I was when the high consul appeared to me eighty... eighty-five hours ago in my office in Sol system. He didn't register on the sensors. He didn't interact with any physical object or leave any evidence of his presence that could be verified by an outside observer. But he was here. And before you get too happy with the Anton-Trejo's-having-a-psychotic-break theory, there is some external evidence. Just not here in Sol.

"Shortly after I experienced what I experienced, Duarte disappeared from the State Building. Not popped-out-of-reality disappeared. He put on his pants and a fresh shirt, had a cup of tea and a polite conversation with his valet, then walked off the grounds. Every planetary sensor we have has been sweeping the landscape since then. No one has seen him.

"We've got over a thousand colony systems that are wondering if there's anything left of the government. We have extradimensional enemies experimenting to find ways to snuff us out wholesale. And I am convinced that the answer to both of those issues is Winston Duarte, or whatever the fuck he's turned into. I've known you for a long time, and I trust you. Your mission is to find him and bring him back. You've heard of *carte blanche*, but I promise you have never seen a check this blank. I don't care what you spend—not in money, equipment, or lives—as long as you bring Winston Duarte back from wherever he's gone. If he doesn't want to come, convince him nicely if you can, but this only ends with him in our custody.

"Good hunting, Colonel."

The message ended. Tanaka leaned back on the sofa, stretching her arms to her sides like a bird unfurling its wings. Her mind was already ticking away. The strangeness of it, the shocking revelations, the threat it posed. All of those were in her. She could feel them. But there was also the calm of a job that needed doing and the pleasure, deeper than she would have guessed, at the power she had just been given.

The door opened quietly, and Admiral Milan came back in.

“Everything all right?” he asked.

Tanaka laughed. “Not even close.”

Chapter Three: Naomi

They waited until the *Black Kite* was far enough from the ring gate that an intercept burn would have been difficult if not impossible. Then they waited a little more so that they wouldn't seem suspicious for starting their transit burn at the first possible moment. And then Naomi couldn't stand waiting anymore.

Three hours after that, the Laconian frigate hit them with a tightbeam demanding in official language and harsh tones of voice who they were and where they thought they were going.

"This is the *Vincent Soo*, independent freighter on contract with Atmosphäre Shared Liability Corporation out of Earth. We are carrying ore samples for quality control testing. Our public contracts and permissions are attached. Message repeats."

The voice was built from samples of ten different men, slip-mixed by the *Roci*'s system so that even if the Laconians realized the message was false, they wouldn't be able to track the voice patterns back to anyone. The *Vincent Soo* was a real ship with a similar drive signature and silhouette to their present modified version of the *Roci*, though it didn't work outside Sol system. The contracts the message included would come back as real unless someone started digging into them. It was as plausible a mask as Naomi could fashion.

"They aren't responding," Alex said.

They were both on the ops deck. The lighting was low, though she noticed that Alex had started keeping even the low settings a little higher than he had when they'd both had younger eyes.

"Could be good, could be bad," Naomi said.

"Sure wish I could tell which it was."

"If they start chasing us with their guns blazing, then it was bad."

Alex nodded. "Yeah. That makes sense. I just wish they'd say 'Hey, we

decided not to chase you down and kill you.’ Just out of courtesy.”

“At this range, we’ll have plenty of time to watch violent death barrel down on us. You won’t miss anything.”

“Well, thank God for that.”

With every minute the *Black Kite* didn’t answer and didn’t turn its drives in pursuit, Naomi felt the fear of capture or destruction fade, and the fear of transit grow. It was hard to believe that there had been a time when her life hadn’t been moving from one trauma to the next like walking on stepping-stones in an ornamental garden. There had been whole decades when passing through the ring gates hadn’t been more than a passing unease. Yes, if there was too much traffic, the ship could go dutchman—quietly vanish from existence for who-knew-where or no place. But it had been the same scale of threat as anything. They could hit a micrometeor that broke their drive. The magnetic bottle could fail and spill a free fusion reaction into the body of the ship. She could have a stroke.

Once, there had been rules about how the gates worked. Human rules about what traffic was allowed through. Inhuman rules about how much matter and energy could pass through in a certain period of time without angering the dark, ship-eating gods.

All of that was gone now.

“How many ships you think they have looking for us?” Alex asked.

“You mean how many ships do they own, or how many are in the specific hunt group tasked with trying to find us?”

Alex was silent, then made a soft clicking sound with his tongue. “Probably wouldn’t like either answer, would I?”

“How long until we reach the gate?”

“If we don’t brake before the transit, about eighteen hours.”

Naomi unstrapped from her crash couch and stood up. The deck rose up under her, thrust gravity at just over half a g. “I’m going to get some rest. Call me if someone decides to kill us.”

“Will do,” Alex said as she headed for the lift. And then, “How’s Jim?”

Naomi looked back. Alex’s face was tinted blue by the light of his screen. The thin white stubble of hair clinging to the side and back of his head reminded her of pictures of snow on rich soil, and the gentleness in his eyes told her the question hadn’t really been a question.

“Yeah, I know,” she said. “But what can I do?”

She made her way down to the crew decks, listening to the reassuring hum of the ship around her. After so many years in close company with the *Roci*, she could judge the health of the ship by its sounds. Even if she hadn't known already that they were running the drive just a little out of balance, she'd have been able to pick up on it from the way the decks muttered and creaked.

When Jim had been taken prisoner by Laconia, Naomi had mourned him. Mourned the version of herself that had him at her side. When, against all odds, he'd come back, she hadn't really been ready. It was something she hadn't let herself hope for, and so she hadn't thought deeply about how it would be.

The crash couch was rigged up for the two of them to share. For extended hard burns, one or the other of them might take one of the spare cabins or—more often—a couch on the ops deck. The doubled couch wasn't built for optimum function so much as quality of life. The pleasure of waking up at someone's side. The intimacy of watching them sleep, feeling them breathe. Knowing on a cellular level that she wasn't alone.

Jim was sleeping when she came into the room. He still looked thinner than she remembered him being before his time in prison. Before her time in self-exile. It might only have been the graying of his hair, but the skin of his eyelids seemed darker than it had been before, as though he'd been bruised in a way that wouldn't heal. Even in sleep, there was a rigidity to his body, like he was braced against an attack.

She told herself that he was recovering, and that was probably true. She could feel the passing days and weeks changing her too. Letting her expand a little bit more into a place she hadn't had access to when they had all been apart. It was different than it had been. Bobbie was gone. Clarissa was gone. Amos was transformed in ways that made her skin crawl if she let herself think about it too much. And Teresa and her dog were there, half permanent passengers and half threat. Even so, this was closer to the life she'd had than she had any right to expect. A version of her family, back together. Sometimes that was a comfort. Sometimes it was just a way to be nostalgic for what hadn't returned.

If they could stop, recover, decompress, who knows what else they might have been able to salvage, but they couldn't.

She lay down beside him, her head pillowed on one folded arm. Jim

shifted, yawned, cracked open one eye. His smile was the same—boyish, bright, delighted to see her. *This time is a gift*, she thought. And she smiled back.

“Hey, sexy lady,” Jim said. “What did I miss?”

Years, she thought. *We missed years*. Instead of the truth, she smiled.

“Nothing critical,” she said.

“I really want to slow us down,” Alex said.

Naomi, in the galley, was putting the remains of her meal into the recycler. They had cut thrust, and the whirl of the vacuum sucking the stray bits of food into the system was almost as loud as Alex’s voice over the comms. On the wall screen, the Kronos ring gate hung against a wide field of stars, the weird dark, twisting mass at its perimeter visible only because of the *Roci*’s enhancements. With each passing second, the magnification dropped. The ring was a thousand clicks across, their transit was counting down from twelve minutes, and it still would have been invisible to the naked eye.

“You can tap the brakes if you want to,” Naomi said. “But if there’s unfriendly company in the ring space, it’ll just make us easier to hit.”

“I want to charge up the rail gun,” Alex said. “But you won’t let me, so I’m sublimating.”

“You could recheck the torpedoes and PDCs.”

“Amos and Teresa are doing that already. I don’t want to seem like I don’t trust them.”

“You could arm the hull charges and be ready to blow the disguise plates off.”

Alex was silent for a long, slow breath. Across the little room, Jim gave her an approving thumbs-up.

“Yeah, I’ll do that,” Alex said. “Really want my rail gun up, though.”

“When we’re on the other side, you can charge it to your heart’s content,” Naomi said.

“Promises, promises.” A click said that Alex had dropped the connection. The magnification on the ring gate continued its slow fall. Naomi called up a little inset window pointing back. The noise from their drive cone made the image blurry, grainy, and approximate, but even so, she could see that the *Black Kite* wasn’t moving toward them.

“I’m not seeing a repeater,” Jim said. “They blew ours up, but it doesn’t look like they dropped one.”

“I noticed that. They aren’t worried about coordinating with anyone on the other side. So there’s at least a chance we aren’t burning straight into a trap.”

“Yay!”

Ten minutes remained.

“Ready?” Naomi asked. In answer, Jim pulled himself to a wall handhold and pushed off toward the central lift. Naomi opened a connection to Amos. “We’re taking stations on the ops deck. Not that we’re expecting any trouble, but if there is some...”

“I hear you, Boss. I’ve already got the pup in her kennel. In case we bang around a little.”

Bang around a little meaning evade incoming fire. “And Teresa?”

There was one of his odd pauses before he answered. “We’re strapping down in engineering. You have a need, just say the word.”

Naomi dropped the connection and followed Jim. The lift was at the bottom of the shaft, locked down until someone called it, and they swam through the empty air of its shaft until they reached ops. They went to their usual stations, pulled the straps across their bodies, shifted the screens to the controls they would each take if the transit landed them in danger. The combination of fear and familiarity turned it into a ritual, like brushing her teeth before sleep. The ring persisted, but the lensing of the telescopy put fewer stars around it now.

“Ready in ops,” Naomi said.

“Flight deck,” Alex said.

“Yeah,” Amos said. “We’re good. Do your thing.”

The counter reached zero. Jim took a sharp breath. The gate blinked to the grainy trailing image—the same structure, but behind them now and receding. The stars all went out at once.

“And we are through,” Alex said. “No threats on the board so far as I

can see, but shit howdy, are there too many people in here. I'm flipping us around and putting the brakes on until we know where we're headed."

The thrust gravity warning went on even though he'd just said it, and after a moment of vertiginous rotation, up and down returned. The gel of the couch pressed into Naomi's back. She had already brought up the tactical map.

The ring space—what she still thought of as the slow zone even though there hadn't been the hard limit on velocity here since Jim and a protomolecular echo of Detective Miller had turned it off decades ago—was a little smaller than the sun in Sol system. A million Earths could have fit in it, but the only things it contained now were 1,371 ring gates, the single enigmatic station at its center, and fifty-two ships including the *Roci*, all of them on transits of their own. Alex was right. It was too many. It was dangerous.

"How many do you think we've lost?" Jim asked. When she looked over, he had the same screen open before him.

"Just underground ships?"

"No, I mean the big we. Everyone. Laconian. Underground. Civilians just trying to get supplies where they're needed. How many do you think we've lost?"

"No way to know," she said. "No one's keeping track anymore. There's a war on."

She set the *Roci* to identify the ships by transponder, drive signature, thermal profile, and silhouette, to note any discrepancies and flag any ships that were known to be associated with the underground or the Laconian Empire. It took the ship system three seconds to produce a compiled list with cross notations and a navigable interface. Naomi started the human work of paging through. The ships most closely allied with Laconia were a freighter called *Eight Tenets of Bushido* that operated out of Bara Gaon and a long-range explorer called the *Flying Buffalo* that was based in Sol but owned by a corporate network that had embraced Duarte's rule the moment Earth and Mars had surrendered. Neither were warships, and both struck Naomi as being allies of convenience more than true believers in the Laconian cause. They weren't part of the official Laconian hierarchy, anyway.

The only ship on her known underground contacts was an independent

rock hopper out of Sol that was flying as the *Caustic Bitch* but was listed in the registry as *PinkWink*. There was probably a story there, but Naomi wasn't sure she wanted to know what it was.

There was also a bottle on the float.

"One of yours?" Jim asked.

"Hope so," Naomi said. "We'll see."

Once, humanity's comm network had been a fairly robust thing. In-system radio signals hit repeaters at the ring gates that were either strong enough to shout over the interference in the gates or actually physically penetrated them with transceivers on both sides. Medina Station, at the heart of the ring space, had maintained them and monitored the comm traffic. For decades, a message from Earth could reach Bara Gaon and receive an answer back within a day even if the signal queuing was swamped. But with the death of Medina and the rise of the underground, that was gone.

Now the thirteen hundred worlds communicated in a shifting patchwork of relays, ships carrying messages, and the modified torpedoes she called bottles. This one in particular was an advanced design, set to wait and gather incoming messages from the underground that were meant for her and keep them until it was triggered. It was an imperfect system, and she was certain she'd lost more than a few along the way, but it was easy to verify, difficult to fake, and difficult if not impossible to trace.

She pulled up the Epstein drive controls and dropped in a slightly altered feed pattern. To anyone besides the bottle, it would be unremarkable—well within the range of normal drive fluctuations. To the sensor array on the surface of the bottle, it would match a pattern.

It did.

The bottle shouted a dense blip of tightly packed data, putting it out broadcast for any ship in the slow zone to hear. A tightbeam would have pointed a finger if anyone had caught backscatter from it. This could be meant for any of the dozens of ships that could hear it. And every now and then, the underground set false bottles to sneak into the slow zone or a gate to spit out faked data and confuse the patterns.

The *Roci's* system sucked in the radio burst and set quietly to work decrypting it, while at the edge of the ring space the bottle lit its own drive and zipped out through one of the gates. Naomi's underground knew to

watch for its detonation as the sign to place another one when they could. If the Laconians saw it—even if they knew what it meant—there still wasn't anything for them to do about it.

It was all run like an OPA cell writ large, and Naomi was the one who'd designed it. The sins of her past, finding a use.

"Well, that could have gone a lot worse," Jim said. "I guess the question now is where we go next."

"That will depend on what's in the data," Naomi said. "I don't like spending more time in the ring space than we have to."

"I would also hate to be eaten by forces from beyond space and time before it was my turn." The lightness and humor she'd always known were still there, but there was an emptiness behind it. Not nihilism, she thought. Exhaustion.

"If we need to," she began, "there's always—"

Teresa's voice cut in on the ship-wide comms. "I need help. In the machine shop. I need help now."

Jim was unstrapped before the girl had finished speaking. All the weariness was gone from him. He didn't wait for the lift to engage, dropping down the handholds in the shaft like climbing down a ladder. Naomi was barely behind him. Some part of her was almost relieved to see him moving with certainty again. Like catching a glimpse of the Jim from before. Even if a lot of him was in hiding, he was still in there.

"What's going on?" Alex asked from the flight deck.

"Something's happening to Amos," Teresa said. She had the tense calm of an emergency responder.

"We're on our way," Naomi said. Jim didn't respond at all. When they reached the engineering deck, Naomi heard something. A voice, Amos' voice, but not with words in it. It was a low wet sound, half growl, half gargle. Something about it reminded her of drowning. She and Jim strode down to the machine shop together.

Teresa was sitting on the deck, her legs crossed and cradling Amos' wide, bald head in her lap as he jerked and shuddered. A pale foam dripped from his mouth, and the pure black eyes were wide and empty. A sickening smell—as much metallic as organic—filled the air.

"He's having a seizure," Jim said.

Teresa's voice trembled when she spoke. "Why? Why is this

happening?”

OceanofPDF.com

Chapter Four: Elvi

Get her out,” Elvi said. “I’m pulling the plug.”

“No,” Cara replied. The girl’s voice was still shaking, but the words were clear. “I can do this.”

Cara’s brain function showed in seven different datasets on twice that many screens. The data from the BFE—the technicians’ pet name for the Jupiter-sized block of green crystal that was the only feature of Adro system—showed beside it. Advanced pattern-matching protocols mapped the two together in six dimensions. The instability had passed in both datasets, the seizure—if that’s what it was—falling back from turbulence to a more stable flow.

All around the lab, the researchers and techs turned wide and uncertain eyes toward Elvi. She could feel the desire to keep pushing forward from her whole staff. She felt it herself. It reminded her of being the RA in her graduate dorm house and having to shut down the hall parties.

“I am the lead researcher. She is the test subject. When I say we’re pulling the plug, we’re pulling the plug.” As her team sprang to life, closing down the experiment, she turned to Cara, who was floating over the bed of imaging sensors. “Sorry. It’s not that I don’t trust you. It’s that I don’t trust any of this.”

The girl with the pure black eyes nodded, but her attention was on something else. Cara’s visual and audial cortices were lit up like Paris at New Year’s, and a deep, slow pulse was passing through the girl’s postcentral gyrus that matched the energy readings coming from the BFE’s southern hemisphere. Whatever Cara was feeling just then, it was taking up more of her attention than Elvi was. She had the sense that she could scream in Cara’s ear right now and still be a tiny minority of the information flooding the girl’s brain.

Or for that matter the girl’s body, which was part of the issue. Elvi had

studied somatic cognition theory, but the degree to which the BFE seemed to want to present its information to Cara's whole nervous system—muscles and viscera included—was complicating things. She spooled back through the data as her team ran the shutdown procedures and brought Cara back to merely human reality.

The *Falcon*, Elvi's private and state-sponsored science ship, was the most advanced single-function laboratory in thirteen hundred worlds. Which sounded really impressive until she remembered that most of those thirteen hundred worlds were the equivalent of 1880s European dirt farmers trying to grow enough food to not slaughter half their cattle at the start of every winter. The *Falcon* was the only ship that had survived the attack that killed the *Typhoon* and Medina Station, and the scars showed everywhere. The decking was subtly mismatched where threads of darkness that had been somehow more real than reality had ripped a third of the ship's mass away. The power and environmental systems were all patchworks of the original and rebuilt. Her own leg had a line across it where the new skin and muscle had grown in the softball-sized scoop that had vanished in the attack. Working on the *Falcon* was like living inside a trauma flashback. It helped Elvi when she could focus on the data, and on the BFE, and on Cara and Xan.

Dr. Harshaan Lee, Elvi's second lead, met her eye and nodded. He was an energetic young scientist, and she liked him. More than that, she trusted him. He knew what she wanted to do, and with a gesture, he'd offered to make sure Cara's re-emergence from the experiment went according to protocol. She nodded back, accepting the offer.

"All right, people," Lee said, clapping his hands together. "By the numbers and by the book."

Elvi pulled herself through the air to the lift shaft, and aft toward the engine and the isolation chamber and Cara's younger brother Xan.

Fayez floated against one wall, his left leg tucked behind a wall grip and his hand terminal glowing with text. Beside him, the thing they called the catalyst—the body of a woman infused with a contained but live sample of protomolecule—was strapped in its gurney. The catalyst's sightless eyes found her, and Fayez followed its empty gaze.

"How'd he do?" Elvi asked, nodding toward the containment chamber and therefore Xan. Most of the time, the catalyst was stored there, but for

the periods when they used it to activate the old, alien technologies, she put Xan in its place. The only time the young boy and the protomolecule interacted at all was during the changeover.

Fayez pulled up a screen with the security camera. Inside the isolation chamber, Xan floated. His eyes were closed and his mouth was just slightly open, like he was sleeping or drowned.

“Listened to some music, read a few issues of *Naka and Corvalis*, and went to sleep,” Fayez said. “For all the world like the preadolescent boy he appears to be.”

Elvi pulled herself to a stop at her husband’s side. The data on his hand terminal was the feed from the lab laid side by side with the monitors trained on Xan. She could tell at a glance that there wasn’t a correlation between them. Whatever Cara was going through, Xan wasn’t being subjected to it along with her. Or at least not obviously. She’d still feed everything through pattern matching.

She wasn’t conscious of sighing, but Fayez touched her arm as if she had.

“You heard about Gedara system?”

She nodded. “Lightspeed change. Dark gods banging around in the attic. Feels like that’s happening more often.”

“We’ll need more data points for a good frequency analysis,” he said. “But yeah. It does. I hate the feeling that something vast and angry is scratching at the corners of reality and looking for a way to kill me.”

“It’s only scary because it’s true.”

He ran a hand through his hair. He’d gone silver, and when they were on the float, he tended to look like something out of a children’s cartoon. Elvi’s hair was well on its way to white, but she kept it short. Mostly because she hated the compression fluid in the high-g crash couches, and it took forever to get the smell of it out of longer hair.

“You shut down early?”

“There was some instability when she synced up with the BFE.”

Now it was Fayez’s turn to sigh. “I wish they didn’t call it that. It’s a *diamond*, not an emerald.”

“I know. Sorry.”

“And anyway, BFD’s funnier,” he said, but there wasn’t any heat to it. Their marriage was a vast tissue of in-jokes, light comic bits, shared

curiosity, and common trauma. They'd built it like a code between them over the course of decades. She knew the inflections that meant he had something that was interesting him, and how it sounded different from when he was angry about something. When he was trying to protect her and when he was struggling with something he was seeing but couldn't understand.

"What's on your mind?" she asked.

"You didn't notice the sync?"

"What sync?"

Fayez pulled up the dataset again. On one side, the brain and body of a teenage girl fixed at the age when she'd died and been "repaired" by alien technology. On the other, the particle scatter and magnetic resonances of a vast crystal that—if they were lucky—held the history of a galaxy-spanning species whose tracks they were following toward extinction. She could trace the similarities with her fingers. Fayez lifted his eyebrows, waiting for her to notice something. She shook her head. He pointed to a tiny indicator on the side of the readout: IN-FRAME LIGHT DELAY CORRECTION OFFSET: -.985S.

She frowned.

"We're point nine-eight-five light seconds from the diamond," Fayez said. "Matching orbit around the star, neither moving toward nor away from it. The last times we tried this, Cara and the diamond were talking back and forth. Call and response. Now they're singing in harmony. No light delay."

Elvi felt the implications running through her mind like water spilling down a creek. They'd always known that the protomolecule was able to do strange things with locality, but they'd thought it was related to quantum entanglement of particles. Cara and the BFE hadn't exchanged any particles that she knew of, so this pseudo-instantaneous information transfer was something new. One of the fundamental hypotheses of protomolecule technology had just taken a profound hit.

It also meant that their reaching out to the artifact had gotten it to reach back. Her experiment was working.

She'd expected success to feel less like fear.

When Elvi had started working for the Laconian Empire, it had been under duress. Winston Duarte had taken over all humanity with the speed and thoroughness of a plague. When he'd invited her to a senior position in

his Science Directorate, the answer was yes. It would have been a dream job, except for the consequences of refusing it.

Then Duarte's plan to confront the forces that killed off the civilizations that built the ring gates went wrong. Duarte was crippled by it. And Elvi's immediate boss, Paolo Cortázar, was reduced to a thin, heme-stinking mist. Elvi, who'd wanted the job but not the employer, found herself receiving a field promotion to the head of the Laconian Science Directorate with the understanding that her primary task was to figure out how to stop the attacks that were knocking out consciousness, sometimes in single systems, sometimes all through the empire. Unless her primary task was to find a way to fix Duarte's scrambled mind. Or maybe to prevent any more ships from vanishing in the transit between the normal universe and the weird nexus of the ring space.

She had the nearly infinite resources of the empire behind her, the survival of humanity on her shoulders, and a research protocol so streamlined it would have failed out of an ethics review board from just the table of contents.

There were two levels that she had to figure out. First was the civilization that had built the protomolecule and the gates, then the forces that destroyed them. On her best days, she'd thought of herself like a medieval monk struggling to understand the saints to better see the face of God. More often, she felt like a termite trying to explain dogs to her fellow Isoptera so that they could all speculate about fusion jazz.

She understood the protomolecule engineers and what had killed them better than anyone else in all of humanity. Except, if this worked, for Cara. And Xan.

"It was like being in a dream," Cara said, "only bigger. I don't remember really tasting things in dreams, you know? This was tasting things and hearing things, and the shape of my body seemed like it was changing. It was... everything."

“I didn’t feel anything,” Xan said. He sounded disappointed.

Originally, Elvi had done the debriefings with the two siblings separately, talking first to Cara and then to Xan. The idea being that by keeping them from hearing each other’s accounts she could keep them from influencing those reports, but it stressed both of them to be apart.

Now, she brought them into her private lab together, the two of them on the float while she braced herself at her desk and wrote up her notes. The décor was rich psychiatrist’s office: blond grass-colored padding on the walls, spider plants in capillary-fed niches, the low pulse of a dedicated air recycler. Everything about it was designed to say that the woman who used it was a very important person. She hated it more than a little, but she didn’t spend the energy to examine why.

“Was it different from the last time?” Elvi asked.

“There was a... stutter? Like a moment when everything fell apart, and when it came back together, everything was brighter and more immediate? That’s not the right word. There may not be a right word.”

“How did it compare to your experience of ‘the library’?” Elvi asked.

Cara went eerily still for a moment, the way she and Xan did sometimes. Elvi waited for a breath, and then Cara came back. “The library isn’t sensory at all. It’s just knowing things. But this? It isn’t the library, but it’s where the information all comes from. I’m sure about that.”

Xan made a soft noise. Cara put a hand on his arm and pulled him close to her. A primate’s instinct to comfort by cuddling unchanged by its translation across light-years of vacuum into a bubble of ceramic, steel, and carbon lace.

“Were you able to interact with it at all?”

“I think so,” Cara said. “I mean, I didn’t understand what I was doing, but I think I can figure it out. I feel fine. I’m ready to go back in.”

Elvi typed SUBJECT SHOWS STRONG DESIRE TO RETURN TO INTERFACE CONSISTENT WITH DROP IN DOPAMINE AND SEROTONIN LEVELS POST-EXPERIMENT. ADDICTIVE?

“That’s good,” she said out loud. “There are a couple recalibrations we need to make, but we should be ready for another run in a couple shifts. And I’m going to want to run a scan or two while we’re doing that. Check your baseline.”

“Okay,” Cara said, almost hiding her impatience. “Whatever you want.”

Xan fidgeted against his sister’s arm, setting both of them turning a little. “I’m hungry.”

“Go ahead,” Elvi said. “I need to write this up, but you two should eat and rest. I’ll be along in a little bit.”

Cara nodded once, gathered Xan close to her. “Thank you, Doctor.” She pushed off Elvi’s desk with one long, graceful leg. The children—or test subjects, or human-alien hybrids, or however Elvi thought of them in the moment—closed the door behind them. Elvi pressed her palms against her eyes until colors bloomed, and she let out a sigh. Her body was rattling with exhaustion and excitement and anxiety. It felt like drinking too much coffee, and she hadn’t had any at all.

She wrote down the rest of her observations of Cara and Xan and attached the raw data to the report. Then it was just her summary still to go. She shifted the interface to Dictation and let herself float away from her desk. Her leg wanted her to stretch, but it also wanted to cramp. Ever since she’d regrown the hole in her thigh, it did this sometimes.

“We are seeing definite progress,” she said, and the words laid themselves out on her screen. “The triadic relationship between protomolecule catalyst, conscious subject, and the BFE—” Elvi scowled and made a clicking sound with her tongue that backed out the last two words. “—the presumed alien data core seems to be finishing what we’re calling its handshake protocol. I am concerned that the primary subject and the interface weren’t designed for each other, and the interaction between them might be—” She clicked twice again. “—has the potential to be destructive to one or both of them.”

Her office door opened, and Fayez floated in. She raised a hand, asking for silence, as he stopped himself on a handhold. She waited for the door to close before she went on.

“The next phase will be trying to confirm information we already have. Specifically, I’m going to ask the subject a set of simple questions about details from the research into artifacts and archaeology from several systems that she wouldn’t plausibly have had access to. If she can confirm information we already have, that will let us move forward with some confidence that what we get from her further on will be trustworthy. But since she was present in Cortázar’s private lab, and we don’t know what his

information hygiene was with the subjects, I'm having to be very careful in choosing test questions.

"Neither subject seems to have been affected by the events in Gedara system. The staff here, myself included, haven't had any blackouts or losses of consciousness since the all-systems attack months ago. Without knowing what constraints the enemy is working under, I can interpret the limited scope of the Gedara attack as an indication that it is still in an experimental phase, looking for interactions that will be effective in disabling us. Or that the new attacks required more effort, and the enemy doesn't want to expand them. Or that we just don't have enough information yet to know what we're seeing and I'm just talking out my ass."

She clicked her tongue to delete the sarcastic editorial at the end, and then finished the report. She started spooling through the text to look for errors and typos. Fayeze shifted over to her side, watching the screen over her shoulder.

"You didn't say, 'And if we don't get a handle on it soon, the bad guys will figure out how to snuff out all our minds like so many billions of candles, and the cockroaches will have to evolve enough to take over before we get an answer.'"

"Ants, I think, before the cockroaches," Elvi said. "Predatory superorganisms. Cockroaches are just mobile food pods to them."

"You've given this a lot of thought."

She routed copies of the report to Dr. Ochida at the Science Directorate back on Laconia and privately to Admiral Anton Trejo, who was at the moment the closest thing Laconia had to a controlling intelligence for their own predatory superorganism. Somewhere on the *Falcon*, a tightbeam stuttered on and off, spilling light to the repeaters they'd dropped behind them on the assumption that they were still up and functioning. At the speed of light, it would take the information almost an hour to reach the ring gate, then across the cobbled-together, war-ravaged, unreliable communications network that laced the ring space, and then she didn't know how long to reach Trejo.

She packaged another copy of the report, flagged for easy interception by the underground and addressed to Naomi Nagata. She sent it too.

"That's going to get us in trouble someday," Fayeze said.

"We're already in trouble."

“Yeah, but it’s cosmic-forces-beyond-space-and-time-kill-us-all trouble. Feeding all our data to the underground is ship-security-shoots-us-for-treason trouble.”

Elvi laughed, but it was a tight, angry laugh. “What we’re doing here is bigger than politics.”

“I know,” he said. “I just keep hoping the politicians see it too.”

As if in response, her system chimed. A high-priority message from Laconia. Elvi’s eyes only.

“That’s fucking eerie,” Fayez said. “You want privacy?”

“No,” she said. “But I’d better take it anyway.”

The door closed behind him, and she started the playback. Kelly, Winston Duarte’s personal valet, leaned in toward the camera. His lips were thin and gray. Whatever it was, it looked like bad news.

“Dr. Okoye. I have been authorized by Admiral Trejo to brief you on a security matter that may touch on your work. There’s been a change in High Consul Duarte’s status...”

Chapter Five: Tanaka

The Laconian Mechanized Infantry Suit: Special Reconnaissance, or more affectionately the Stalker, was a marvel of design. Built for extended recon, it was lighter and faster than the standard suit, and instead of bristling with weaponry, it was covered with sensors and tracking systems. It wasn't meant for front-line fighting. Its job was to slip in, spot the enemy and mark the targets, then slip away before the heavily armed shock troops arrived to take care of business. The small-caliber rapid-fire Gatling gun on the suit's right arm meant a Stalker could still handle a little business of its own, should the need arise.

In her many decades of service, first in the Martian Marine Corps as a member of the elite Force Recon Battalion at Hecate Base, and later as a combat officer in the newly created Laconian Marines, Tanaka had worn just about every model of power armor made. The Stalker suit was her favorite. Long and lean, fast as a greyhound and tough as nails, she'd always fancied that the suit looked like a robotic version of herself.

The one she wore now was currently a gentle mottled green, the color-shifting surface changing to match the rolling forest and Laconian brush that the suit's three-sixty optics were picking up. It didn't make her invisible, but it meant the suit's camouflage was always appropriate for the environment. Two large battery packs rode on the back, giving her a ninety-hour range. The gun was loaded with a belt of mixed armor-piercing and high explosive. She loped through the forest at an easily sustainable twenty kilometers an hour, scattering the small animals before her. There was no reason to move cautiously. Unless she actually found the high consul out there, nothing in the wilds was a threat to her.

She'd started her work by reviewing some of the files and background previously closed to her.

Actual information about the high consul's personal life and data was

thin, even with Omega status to unlock files for her. His medical records were sketchy and vague. Much of his privacy had been preserved over the years by never recording data in the first place. Everyone else on Laconia, on the other hand, was well documented. She'd taken the high consul's laundry and locked it in a room with her suit's sensor package while she prepped for the trip. When she put the suit on, it had identified the chemical markers of every human who'd come in contact with the fabric. All but one of them were identifiable. Process of elimination made the remaining signal the high consul. Negative space for hunting animals.

Now she had a scent.

From the security records, she could track Duarte to the edge of the State Building's grounds, and then a little beyond it. The track after that was thin. Wind had scattered the scents, rain had washed them away.

Laconia wasn't a huge planet, but it was still an entire planet. Duarte had left days before on foot. Best-case scenario he was still walking, and she'd be able to find him in a long afternoon. But the colony worlds had a habit of sprouting ancient transportation networks—methods the aliens who'd engineered the place had used to move shit around. If he'd tapped into one of them, he could be anywhere on Laconia or miles under it. If she could find where he'd accessed it, she'd have the next step. That was all it took: one step after another until the mission was done.

She was moving fast enough to surprise a family of bone-elk digging for food in the soil with their impressive racks of horns. They startled at her sudden appearance, then all bolted in different directions trying to get away. Her suit tracked them all, marking their threat level as low. If she overrode that and changed the threat to high, the gun on her arm would turn the entire herd into paste in seconds.

She chose not to.

At first, she followed the vague signs. A 15 percent match, hardly better than an educated guess, led down a particular animal trail lined by silver-leaved bushes. A 20 percent match went directly up a sheer rock wall, and she discarded it as a false positive. As she crisscrossed the landscape, her mind relaxed into the experience of the search, and time became less concrete. She'd heard about a similar kind of flow with artists when they fell deeply into their work. It was a lovely way to be—alone in her head with the pure focus of the task.

She made steady speed through the narrow band of forest and into the rocky foothills of a mountain. When she reached it, she had a pretty good hunch where she was going. Topographical maps led her through a twisty box canyon and up to the entrance of a cave. It was well hidden from casual view. No wonder no one had found it without a concerted effort. Teresa must have thought she'd found the best hiding spot in the world.

A pair of large rodent-like creatures—black fur and eyes, callused mouths, and ears like seashells—were in the entrance, fighting or mating or some combination of the two. They stopped and hissed at her as she approached, baring brownish hook-needle teeth. She kicked them out of the way. They hit the cave wall with a wet thud, and stopped moving. She considered the little bodies for a moment and ducked into the darkness below the stone.

The tunnels near the entrance were where the enemy spy had lived for years. His stink was still everywhere. The suit also found traces of Teresa and a dozen other Laconians. The extraction team that had killed Timothy or Amos Burton or whoever he'd been, and then the search team that came looking for his corpse and his equipment. The report said he'd been sitting on a backpack nuke the whole time. The prevailing theory was that he was waiting to see if he could extract James Holden before using it. She had a certain respect for that. There was a purity about someone who could casually hold death in his hands, just waiting for the right moment.

The suit thought it had Duarte's scent, but if the high consul had come through here, his trail was either too faint or too muddled up with everyone else's for the suit to track it with certainty. She moved through the cave, trying to recapture the pure state she'd felt in the forest, but something about killing the little not-rats and finding the evidence of the spy's nest had gotten her thinking. The pure and beautiful moment was gone, even if the hunt was still on.

The stone here was pale, flaking, and weak. She could have dug a passage through it with the powered gloves of her suit. It made her more than a little worried about cave-ins, especially after she got past the entry area where the camp had been and the tunnel system turned into a maze. Her suit's inertial tracking meant it could create a 3-D map of everywhere she went in real time, but the mountain was large. If the tunnels carved their way through the whole thing, she could be there for days. If she was right

and Duarte had come here, it was going to be hard getting him out.

The efficient thing would have been to call for a swarm of micro drones and flood the tunnels with them. But Trejo had impressed on her the need for strict operational security, and including a tech team to run the drones felt like an unnecessary risk. Still, if she couldn't put her hands on the man, that could be her plan B.

She wasn't ready to give up, though. Not yet.

The farther into the caves she got, the less natural they seemed. Near the entrance, they had felt like accidents of geology, but here and there strange textures and protrusions began dotting the walls and grew up from the floors in the larger caverns. Black and silver spirals that seemed to carry their own light. Tanaka had spent enough time on Laconian warships built by the strange orbital shipyards to know protomolecule builder tech when she saw it.

This place had definitely been one of their installations, but its purpose was lost to time. The report from the investigation team had marked the location as needing further study, but with the attack on Laconia, everyone seemed to have just forgotten about it. No one's first priority. Unless maybe Duarte's.

She passed through a complex junction—an east-west tunnel above intersecting with a curving north-to-southeastern one below, and the suit alerted. She checked the display. Seventy-five percent match in the upper passage.

"Got you," she said.

Only maybe she didn't. She followed the suit's prompting through the twists and turns of a section of the tunnels, the chemical signal staying between 75 and 60 percent match, and came out into a large room filled with elaborate crystalline growths. They rose from the floor like delicate five-meter-high towers of glass lattice, glowing in soft pastel colors when her suit's lights hit them. In another context, they'd have been breathtakingly lovely. A kind of post-revivification abstract sculpture. She wondered if they were made by alien intelligences or the blind, idiot forces of nature. That she couldn't tell was either beautiful or damning, but either way, beside the point.

The suit was sure the high consul had been in the room. Her first 100 percent hit. Whether he was still in there or not, Duarte had definitely stood

where she was or very close to it. Had seen the crystals with his weirdly altered eyes. Her heart rate increased a little as the realization struck that she might actually be able to find him. The relief at a real prospect of success showed her how carefully she'd been ignoring the possibility of failure.

The trail led her around the base of one of the towers. A pair of doglike constructs were worrying at a shard of crystal lying on the ground next to it. Tanaka could see the gap at the top of the tower where it must have broken off and fallen. In the files, Laconian intelligence called these things repair drones and indicated that they were nonthreatening. Occasionally they'd wander into the fringes of the city and steal broken things, only to later return them repaired, but altered. Researching what they chose to fix and how they went about intuiting original function was one of the projects that the Science Directorate was going to get around to one of these days.

The suit indicated that the high consul's scent was on one of the drones. Tanaka scowled to herself. If Duarte had left his scent on the thing by touching it—if that was the trail she was following—she was screwed. They could have interacted anywhere before the dog came here, and she'd have no idea where Duarte and this thing had met up.

She was about to go searching for another trace of the scent when one of the dogs said *ki-ka-ko*, then picked up the broken crystal shard in its weird puppetlike mouth and wandered off. She followed it.

After a confusing series of twists and turns, they emerged into another chamber, ten times the size of anything she'd seen before in the tunnels. It was like stepping into a cathedral. A fluting sound like wind over the top of empty bottles muttered through the space with no clear origin. Strange, almost organic-looking mechanisms grew up from the floor and towered over her, ten or fifteen stories high. For a moment, she felt something like awe.

In among them were half a dozen pits filled with viscous brown fluid, like sewer water mixed with petroleum oil. The dog walked over and dropped its broken bit of crystal into one of the pools, then waited motionless. The suit warned her that there were eleven other mobiles in the cavern. Each of them another one of the weird dog things. None seemed hostile. As she watched, they brought things into the room and dropped them in the pools. One time, a dog took something resembling a half meter

of water pipe out of the pool and then left with it.

“This your machine shop, puppy?” she asked. “What are you doing here?”

Tanaka raised her arm and fired half a dozen shots into one of the motionless dogs, blowing it apart. She waited. After a few moments, three of the other dogs came over and began gently picking up the pieces of their dead comrade and dumping them into the pools.

“Ah-ha,” Tanaka said to them. “Fixing your friend up, aren’t you? All right. I’ll wait.”

They just looked back at her with their big eyes as though they were embarrassed at her outburst.

One said *ki-ka-ko* but didn’t move.

There were a lot of strange chemicals in the air in the chamber, and the suit took a while sorting through them all, but after a few moments it popped up an alert. Duarte’s scent. It was a significant trace. She had a hard time believing that it was just contact with a repair drone. If he’d passed through that room, had he been hurt or killed and the dogs brought him there? Had he figured out the same thing she just did, and used the sewage pools to fix something? Her hands itched a little bit, and she grinned. She felt the impatience of the chase, like she was a dog straining at its leash at the smell of rabbits. The joy of the hunt.

Slowly, methodically, she moved around the perimeter looking for the strongest match. Tracing Duarte’s movement inside the room was probably pointless, but knowing where he’d come from and what direction he’d left would be enough. The best hit was a tunnel leading off the large cavern and gently sloping up.

She followed it, the chemical scent growing stronger as she moved. Half an hour later she emerged into a large room with an open window to the outside.

The chamber was shaped like a half circle, with a flat wall nearly sixty meters across. The middle twenty meters of the wall were missing, creating a large opening to the outside. Sunlight streamed in. Sky glowed oxygen-blue between the draping strands of vine and branch.

He’d been here. More than that, he’d spent time here. Duarte’s scent marker was everywhere.

“High consul?” she said, the suit amplifying her. “This is Colonel

Tanaka. If you're here, I just want to talk with you, sir."

No one answered.

On either side of the outside opening were spindly cradles growing up from the floor, with fifteen-meter-long egg-shaped objects held in them. The eggs had the same mother-of-pearl gleam she'd seen in the interior of a *Gravitar*-class battleship. Like something made at the alien construction platform. And the high consul's most recent scent track moved up to the empty cradle in the center. She walked slowly around the cradle, but no track led away.

"All right, little buddy," she said to the egg that had been there and was gone, "what the fuck are you?"

"A ship," Dr. Ochida said.

Tanaka leaned back in her chair. She'd taken over an office in the State Building as her base of operations with a staff of ten and high-priority access to everyone of any importance to the empire. The décor was generic politician, but she'd put a print of Ammon Fitzwallace's *Artemis the Hunter* on the wall where she could see it, all vibrant green with shocks of bright and bloody red.

"You're sure?"

"Well, no," Ochida said. "We have a team going to the site now, as you requested. We'll know more once that's complete, but we have seen similar structures elsewhere. Persephone system. Bara Gaon. Swarga Loka. Seven Kings. It's not the most common, but it's certainly not unprecedented. A fair proportion of the artifact tree seems focused on material transport, and especially in the Seven Kings data, we see—"

"Probably a ship."

"That's oversimplifying. We believe they were material transport pods," Ochida said. "But—"

"Did it fly?"

"The location and design seem to indicate yes," Dr. Ochida agreed with

a nod.

“Then how do we track it?”

Ochida leaned forward. His chair creaked under him, and he blinked like an owl. “Track it?”

Tanaka clenched her fist where the scientist couldn’t see it and kept her voice even. “If I wanted to find where the ship went. Is there a drive signature I can search for? Some kind of energy profile?”

Ochida shook his head like she was a little girl who’d asked him for a unicorn. “The native propulsion systems aren’t something we’ve cracked yet. Not for want of trying. But we’ve known since Eros moved that it involves decoupling local inertia from frame inertia. That’s not something that has a drive. It seems more like a controlled gravity where a nonlocal area falls *through* normal space—”

“Okay,” Tanaka said, not punching the grinning scientist in the face only through great effort of will. “No drive plume. Then what can I use to find it?”

“Eros was also invisible to radar, you’ll recall.”

“You’re telling me a lot of things I can’t do. Start telling me what’s on the ‘can’ list.”

Ochida shrugged. “Eros was at least always visually available. If the ship passed through any light telescoping, you might find it that way. Of course, after the attack the planetary defenses are compromised, so...” He pressed his lips together in a universal gesture of impotence.

“All right,” Tanaka said. “Thank you.”

“You’re quite welcome.”

“No,” she said. “I mean you’re dismissed.”

Ochida blinked in surprise, but then he left. So that was good.

Tanaka ached. She’d barely begun, and her search area had just expanded from Laconia at or near a transport network to literally anyplace in 1,300 systems and no obvious path to narrow it down. The raw frustration of it was a knot between her shoulder blades. She pulled up a notepad and started thinking her options through. Signal intelligence was obvious. Images of the remaining egg-ships had to be put out to anything with visual telescopes. Stations. Ships. Anything near a ring gate.

The *Voice of the Whirlwind*—the only surviving *Magnetar*—was acting as ersatz planetary defense. It would be the priority. If it had seen the egg-

ship, that would at least give her an idea what direction it was going. It was possible, after all, that Duarte had been going someplace in-system. She didn't know for sure he'd been headed for a gate.

And then... what? Hunting a ship that couldn't be tracked on radar, that didn't leave a drive plume. That ran dark. If she knew what he'd been going after, maybe it would give her a smaller list of possible destinations. She'd need to talk to the valet and Admiral Trejo to see if Duarte had given any hint where he might be heading.

Or... maybe hunting wasn't the right model. Maybe trapping was. Maybe it wasn't a *place* Duarte was heading for. If the high consul was looking for something, that thing could be used as bait.

The records of ongoing operations were highly restricted. Trejo was probably the only one who could access everything, but he'd given her the keys. There were five active groups trying to recover Teresa Duarte. She read over their operating reports, but half of her mind was probing the strategy. Before his resurrection, the only sign Duarte had given that he was still conscious was his slaughter of Paolo Cortázar. That, according to Dr. Okoye, who had been there at the time, had been out of concern for his daughter. Was it such a stretch to think that the girl would be the first person he reached out to now? Wasn't she the best available bait?

It sure as hell seemed like better odds than tracking the missing ship.

The most promising lead was an intelligence counter-op. A distant cousin of Duarte's dead wife ran a boarding school on New Egypt, and there had been some chatter between her and known underground contacts. If Tanaka had the girl, it was the sort of place she'd have found to park her. And the school's new term was starting soon. Hiding a teenage girl in a place with a lot of other teenage girls made sense.

Tanaka pulled up the command structure. The operation was being run through a hunting frigate called the *Sparrowhawk*. Captain Noel Mugabo was in charge.

Or had been, anyway. Until now.

She opened a connection to her aide and didn't wait for him to speak. "Contact the *Sparrowhawk* and let them know I'll be taking over direct operational command of their New Egypt mission. And find me a fast transport. Something with the breathable-fluid crash couches.

"Put me on New Egypt now."

Chapter Six: Naomi

Amos—or the thing that had been Amos—smiled and waited for the autodoc to finish its run. Naomi, braced at a handhold, watched the values and scans as they spooled out. Red and amber and occasionally green, they were the medical equivalent of a shrug. The machine thought he was a basket full of different kinds of strange. Some was the strange he'd been ever since returning from Laconia. Some was new strange that deviated from previous measures. Whether any of it was significant was anybody's guess. There was no comparison data for an animal like him, no others of his kind apart from the pair that Elvi Okoye had. There was no context.

Naomi felt that way a lot these days.

"I'm feeling fine," he said.

"That's good. You should stay here for a while anyway. In case it happens again."

The pure black eyes shifted. It was hard to tell if he was focusing on her or something else in the room. Without iris or pupil, he could appear all-seeing and blind at the same moment.

"I don't think I'll be getting the wiggles again anytime soon," he said.

"You've been pretty shaken up. Not just this. All of it. Better that we get an idea what's going on with you now so you don't have another seizure while you're doing something dangerous."

"I get that. But it's not going to happen again."

"You can't know that unless we know why it happened."

"Yeah."

They were quiet for a moment. Only the hum of the air recyclers and the muttering of the autodoc. "Do you?"

"Do I what, Boss?"

"Do you know why the seizure happened?"

Amos lifted a wide, grayish hand in a gesture that said *maybe, maybe*

not. The little widening of his smile was exactly the one he'd have used before, but half a second later than he would have used it. "I got a feeling. There's stuff running in the background with the new head. There was a hiccup. Don't think it'll happen again."

She tried to smile back, but it felt forced. "That's not as reassuring as you think."

"You don't think I'm him, do you?"

She noted the pronoun. *Him*. Not *You don't think I'm me*. "I don't even know what that question means."

"It's all right. I get it. I went away like I used to be. I come back with these eyes and this blood. And my brain doing things it didn't use to do. If you weren't at least wondering, that would be weird."

"Are you?"

"Am I?"

"Are you still human?"

His smile could have meant anything. "Not sure I ever was, really. But I know I'm still me."

"That'll do then," she said, and made herself lean over and kiss his wide smooth scalp the way she might have if she hadn't had doubts. If it was true, and he was Amos, then it was the right thing. If it wasn't, and he wasn't, better that whoever he was believe she accepted him. "Still, wait an hour before you get back to work?"

He sighed. "If you say so."

She squeezed his shoulder, and it was solid. Had it felt like that before? Amos had always been strong. He'd spent as much time in the ship gym as Bobbie, and Bobbie had damn near lived there. Naomi couldn't tell if this was a change or just her mind looking for discrepancies. Building them whether they were there or not.

"I'll check on you," she said, because it wasn't a lie, no matter what she meant by it.

The ring space wasn't somewhere to relax. There had been a time when it had been the hub of humanity's great spread to the stars. It had seemed safe then, or relatively so. Anything that found its way to the edge of the sphere defined by the ring gates vanished and was lost, but nothing reached back.

Until it did. And then it had been annihilating. Now most ships moved

through it fast and hot, setting the angle of their transit before they came in and getting out the farther gate as quickly as they could. It was exactly the wrong thing to keep from going dutchman, but it minimized the time spent in the uncanny space.

Other ships passed in and out of the rings, the traffic of more than a thousand systems, all of them relying on trade to one degree or another. All of the ships on their own errands with no particular interest in or awareness of Naomi and her burdens. The *Roci* stayed there, on the float. Every hour courted the danger that reality itself would start boiling again and everything in the ring space would be killed. But before they could go anywhere, they needed a place to go and a plan that was more fleshed out than *Don't die*.

She worked on the ops deck, floating just over her crash couch with her legs folded in the lotus position. The straps shifted around her like kelp in a vast water recycling tank, and the web of the underground spread out on the screen before her. It had been easier when she'd been focused on attacking Laconia. Breaking things was always easier than building them up.

In the aftermath of Laconia's defeat in its home system—on its home planet—the empire had moved to consolidate the power it still had. Trejo was locking down shipyards and supply lines as best he could with the forces that remained to him. Naomi was trying to leverage the influence and organization she'd gathered for the battle into some kind of sustainable self-governing network. The newsfeeds from Sol, Bara Gaon, Auberon, and Svarga Minor chattered about increased Laconian presence. Though why anyone was worried about a backwater like Svarga wasn't entirely clear. The message queue was as long as her arm, it felt like.

"Their objection is the same one we're seeing over and over again," Jillian Houston, the captain of the underground's stolen flagship, said from Naomi's screen. She looked like a child. She was older than Naomi had been when she'd signed on to the *Canterbury* a lifetime ago. "Báifàn system is on the edge of being self-sustaining, but which side of the edge is debatable. They don't like anyone saying when they can and can't trade, and they're absolutely not going to accept constraints that other systems aren't abiding by. And I have to say, I'm sympathetic. We're here to protect people's freedom. I'm not sure what liberty is if you're not permitted to decide what chances you're willing to take."

Naomi turned her head, trying to ease the knot at the base of her skull. She'd watched the report three times now, each time hoping she'd find a graceful and diplomatic response that had eluded her before. It hadn't happened.

Instead, she felt herself growing taut and angry. The tension in her neck, the tightness across her chest pulling her shoulders forward into a hunch, the ache at the corners of her scowl. They were the physical manifestations of an impatience that reached far beyond Jillian's message or her own still-uncomposed response.

She kept coming back to the uncharitable thought that if the underground were just made up of Belters, the problem would have been tractable. Or if not that, at least she'd have been sure a solution existed. Belters were viciously independent, but they also understood what it meant to rely on the community around them. Skipping a seal replacement didn't only risk the life of the slack bastards who'd cheaped out on their work. Failure meant the death of everyone on the crew.

The colony worlds were acting like their safety could exist separate from the well-being of all the other systems and ships. It couldn't be so hard to see how accepting a little restriction and regulation benefited everyone. But inner-worlds culture didn't measure it that way. For them, being better meant being better than the person next to you, not both of you sharing the same increase.

She knew it wasn't fair or even really accurate. Her frustration was leaking out as tribalism and spite. Which was why she hadn't responded yet, even though as the de facto leader of the underground, she had to. What she really wanted to do was put a camera on Jim and have him give one of his heartfelt little sermons about how they were all one people, and that by pulling together, they'd get to the other side of their struggles. It was his genius that he could still believe that, even after everything they'd seen and been through.

But she'd just gotten him back. If she let herself get into the habit of seeing him as a useful tool for her work, it would betray the chance they'd been given. She needed to have the connection between them as something separate, something sacred, that the rest of the universe didn't have claim on.

So maybe there was a thread of selfishness in Belters too.

She started the recording.

“Jillian. Thank you for the report. Please let our friends in Báifàn system know that I hear and understand their concerns, and I absolutely understand their need for safety and equity in how trade is carried out through the rings. The goal has to be minimizing the need for ring transit by building up to sustainability for all the colonies as quickly as possible, and their goal for that is absolutely the same as ours. I’ll include the presentation for why the protocols are the best, safest way forward for all of us, and you can pass that along too. Hopefully, they’ve already seen it.”

But maybe this time they’ll actually pay attention.

Or maybe the builders’ ancient enemy would figure out how to end all human life and none of this would matter. Fatalism had its dark attractions, after all. Hopelessness and despair could almost look restful.

She played back her message, decided that it sounded too pat and rehearsed, and redid it another four times before she gave up and sent it out. The message queue still waiting looked like forever.

She massaged her hands, digging into the aching muscles at the base of her thumbs, while the next message played on her screen. Governor Tuan had thin, terrier-sharp cheeks, frog-wet eyes, gray-black hair, and a tight, officious smile. She wondered whether she would still have thought he was ugly if he’d had a different personality. She’d probably have been more forgiving.

“On behalf of the governing council of Firdaws, I would like to thank you for submitting your proposal. I am very interested in returning to a schedule of reliable and mutually profitable trade.”

“But,” Naomi said to herself as Tuan scowled theatrically on the screen.

“There are, however, some very real concerns about the document as it stands that will require some thoughtful conversation. In that spirit, I would like to propose a summit meeting. While Firdaws is not yet entirely self-sustaining, we do have certain amenities that we will be happy to offer. Our state-of-the-art luxury villas can be set aside for you and your associates for as long as the negotiations take.”

She slid it into a secondary queue. There was only so much explaining to people how cooperation would keep them all from dying she could manage in a single sitting.

The next entry stopped her. It was from Sol. It was from Kit.

The only child of Alex's second marriage was a grown man now, but she'd seen him as a newborn and known his mother, Giselle, as well as any of the *Roci* crew had really gotten to know her. Now here he was, looking into a camera. He looked more like his mother—Giselle's high, sharp cheekbones and regal forehead and brows. When he moved, she could see Alex in him.

"Hey," he said. "So I know it's been a while. And things... I know it's not like we could be in touch more. But I wanted to let you know something."

Naomi's gut tightened, and she braced for a hit. That Kit had come to her had to mean it was something about Alex, or something that would hurt Alex badly enough that Kit wanted to be sure there would be people there to comfort him, even if he decided to keep it to himself.

"Well," Kit said, "there aren't a lot of planetary engineering gigs in Sol system, and the ones there are they have fifteen people applying for every spot. I know that we talked about me keeping a low profile—"

Naomi frowned, trying to remember when she'd said something like that.

"—but we got offered a contract with a geological survey on Nieuwestad. It's a good company. Jacobin-Black Combined Capital. They're doing a lot of industrial construction and microclimate engineering, and I think it could be a really good move for us. But it will make it harder for you to come visit, and I know with Rohi pregnant, you'd want to see your grandson."

Kit grinned like he'd just delivered the punch line to a joke, and Naomi stopped the playback. Relief was like a drug in her veins. She leaned back in her crash couch, the gimbals hissing under her, and called up toward the flight deck.

"Alex! I think I got some of your mail. I'll send it up."

But he was already coming down the lift ladder. "What's up?" he said.

"I got some of your mail. It's in the intelligence packet, but it's yours. From Kit."

His smile was quick and automatic. "Well, play it."

Naomi scrubbed the message back to the start and let it play. Knowing what was coming, she watched his face, and saw the shock and the joy and the tears in Alex's eyes when the news landed. Kit went on for a time,

telling Alex about the dates they were shipping out for Nieuwestad and the due date for the coming child. And some news of no real importance about Giselle and life on Mars. And then the message ended with Kit saying *I love you, Dad* and Alex lowering himself into the crash couch at Naomi's side.

"Well ain't that a kick in the nuts," Alex said through a wide grin. "I'm going to be a granddaddy."

"Yes, you are."

He considered it for a moment, then shook his head. "I was going to say I'm too young to be anyone's grandfather, but I'm not, am I?"

"No," Naomi said. "You aren't. If anything, you ran kind of late."

"Took a while getting it right. God. Kit's a good kid. I hope he's better at keeping a marriage together than I was."

"He isn't you. I'm not saying he won't fuck it all up, but even if he does, it'll be however *he* fucks it up. Not how you did." For a moment she thought of her own son, dead along with his father and the rest of the Free Navy. The memory almost didn't hurt. That wasn't true. It would always hurt, but now it was a low-level ache instead of a knife to the belly. Time had done its healing, or at least let the scars go numb.

The piloting subsystem chimed, and Alex hauled himself up out of the couch. "I guess Giselle's going to be a grandmother." He grinned. "And she's going to hate the shit out of it, isn't she?"

"The title may not fit her self-image," Naomi said.

"You make a good diplomat," Alex said, and headed back for the lift. When she was alone again, she separated Kit's message from the rest of the packet and copied it over to Alex's message queue. She thought about keeping a copy for herself, but it hadn't been meant for her, and she didn't want to presume.

A soft clicking alert, and a new message popped up on her queue. She'd built a system of flags to help her keep track of her cascading responsibilities. This flag was the deep gold color that she'd chosen to mean Home. Issues specific and peculiar to the *Rocinante* and her little family. What remained of her little family.

The message was the one Naomi had been waiting for. Its tracking headers showed the subtle signs and countersigns the underground used to confirm authenticity. The repeaters echoed back to New Egypt, as she'd hoped. Nothing looked amiss. Anything that touched on the daughter of

High Consul Winston Duarte, Naomi treated like it was made from snakes and plutonium.

Once she was certain of the message protocols and origins, she isolated her comm system, offered a silent prayer to the universe, and decrypted the message. It was a single line of text:

ADMISSION APPROVED FOR FALL SEMESTER.

OceanofPDF.com

Chapter Seven: Jim

Why am I only hearing about this now?" Teresa asked.

Jim couldn't tell if the tension was anger, fear, or something else, but it had settled around the girl's shoulders like a shawl. Her eyes were focused someplace just over Jim's right shoulder, fixed and glaring in a way that he knew from his time on Laconia was her way of listening intently.

It was strange to think that of all of them, Jim had spent the most time with Teresa. They'd lived in the State Building for years, her as the child of the high consul, and him as his prisoner. Or maybe both as his prisoner, just in different ways.

"That was me," he said. "I didn't want to float the possibility if it didn't come through."

Her gaze flicked to him with a question.

"I didn't want to disappoint you," he said.

"But it came through. It's here. A possibility."

"It's a boarding school in New Egypt system. Sohag Presbyterian Academy—"

"I'm not interested in a religious education," she said.

"It's not really specifically religious. I mean, there are religious classes and services, but they aren't mandatory."

Teresa took a moment, processing that like she'd taken a bite of food and was deciding whether to spit it out.

"A cousin," she said.

"Elizabeth Finley. She was your mother's cousin, and apparently doesn't think much of your father. It's kind of perfect. She knows who you are, and can take steps to keep you safe, and she's not interested in bowing before Laconia for personal reasons, so we don't have to worry about her deciding to hand you over for a bounty."

"And you've vetted her?"

“The underground did what it could. She seems to check out. There’s not a big presence in New Egypt, Laconian or underground. That’s another part of the appeal.”

Teresa’s gaze floated back over his shoulder as she thought.

Like all the cabins in the *Roci*, Teresa’s had been designed for Martian military back when that had still meant something. Jim was used to the spartan design for himself or the others. Putting an adolescent girl in the same setting made it seem more like a prison. At fifteen, Jim had been a sophomore at North Frenchtown High. The issues he’d struggled with were how to sleep an extra twenty minutes in the mornings, how to cover over his profound disinterest in Mr. Laurent’s chemistry lectures, and whether Deliverance Benavidez would go out with him. Back then, all of Montana had seemed too small. Teresa only had a few square meters.

“What about Muskrat?”

“Finley says it won’t be a problem. There are other students who have pets too. Mostly they’re service animals, but it won’t stand out enough to cause trouble.”

“I don’t know,” she said. “I like it here. Amos is teaching me things. And there are fewer variables here. I wouldn’t know the people there. I don’t think I’d trust them.”

“I hear you,” Jim said. “But this is a warship. And we’re at war. And while you did pull us out of the fire, I’m not comfortable using you as a shield.”

“I’m a good shield.”

“Yeah, but I’m done with that play.”

“Why?” she asked. “I know you don’t want to, but it worked. And it’ll keep working, at least sometimes. Why don’t you want something that works to keep you safe?” The sincerity in her voice surprised him.

“Shields take the hit,” Jim said. “Shields get shot. That’s what they’re there for. And someday, someone is going to think that they can disable the *Roci* by putting a round through our drive cone. Or that it’s worth the risk to drop a few rail-gun rounds through us. There’s a calculus here, and yes, you make them less likely to shoot us down. But I don’t want to be the guy you died for. I’m not okay with it.”

She tilted her head like she was hearing a new sound. “You care about this.”

“Yeah. Kind of do.”

If he'd expected an outpouring of emotion from her—gratitude or admiration or just respect for the morality of his position—he'd picked the wrong girl. She considered him like he was an unexpected kind of butterfly. It wasn't quite contempt, but it wasn't not-contempt either. He saw something occur to her and waited until she was ready to say it.

“If I went, and I didn't like it there, could I come back?”

“Probably not,” he said. And then, a moment later, “No.”

The sorrow in her expression was brief, but it was deep. He understood a little better the loss he was asking her to embrace.

“I need to think about this,” she said. “When do you need my answer?”

When Naomi had come to him with the news, she'd asked him to tell Teresa. Not ask permission, not negotiate with. The verb had been *tell*. And yet, here he was. Jim scratched his neck.

“It's weeks until the term starts. I'd like to get you there early enough to have you situated, but if we make it a relatively hard burn...”

“I understand,” she said. “I won't take too long.”

He pulled himself out of the room, skimming down the corridor. He heard the door close behind him. The ship was quiet. Naomi was waiting for him on the flight deck. He was going to have to tell her that a fifteen-year-old girl had maneuvered him into giving her the choice of going to boarding school or... staying on the ship, he guessed. Doing something that wasn't Naomi's plan. It was barely his responsibility, and he still felt like he'd screwed it up.

He passed Alex's cabin and heard the familiar voice drifting through the door. *But it will make it harder for you to come visit, and I know with Rohi pregnant, you'd want to see your grandson.* Alex had been smiling a lot since the message came through, but he knew there was something else there too. Jim wanted to be happy for him, and he thought he was faking it pretty well. He'd slapped Alex on the back and made grandpa jokes that made his old friend grin.

The truth was, Jim was astounded by Kit's optimism. And by *astounded*, he really meant *horrified*. When Alex talked about his grandson, working out whether he'd been born yet, how big he was likely to be, speculating on the names that Kit and his wife might choose, all Jim could see was one more body on the pile when the end came. Another baby who'd stop

breathing when the deep enemy solved its puzzle. Another death.

Maybe that was unfair. There had been any number of end-times before this: black plague, nuclear war, food web collapse, Eros moving. Every generation had its apocalypse. If they made humans stop falling in love and having babies, celebrating and dreaming and living out the time they had, they'd have stopped a long time before.

It was just that this time, it was different. This time, they weren't going to make it. The only other one who knew, who understood, was Amos. And so Amos was the only one he could talk to.

He made his way down toward the reactor and the drive. The smell of silicone lubricant sweetened the air, and Muskrat's soft bark drew him toward the engineering deck. The dog was floating in the air, her tail a circular whirl that left her head shifting in a circle a few centimeters across. Her lips were pulled back in a wide canine smile.

"Still no sausage," Jim said, and the dog barked softly.

"She doesn't actually care about that," Amos said. "She just likes having you around."

Jim steadied the dog with one hand and petted her with the other. "You know, I would have said dog on spaceship was a very bad plan, but I do kind of like having her here. I mean, more when we're under thrust."

Amos rose from a workstation, a small welding torch in one hand and dark goggles to protect his eyes pushed up onto his forehead. A hydraulic valve was clamped at the station with a line of scorch marks along the ceramic where the metal sealant was still cooling. "She does get embarrassed when I have to take her to the vacuum fire hydrant."

"The what?"

"It's the idiom for where dogs piss," Amos said. "I don't make this up. I just follow the network groups."

"Because there's a lot of floating puppies," Jim said to Muskrat. "You're not the only one."

"They cope with atrophy better than us too," Amos said as he stripped off the goggles and fit them into his tool case. "Something about having more legs on the ground, I think."

"Probably. I will miss her when she's gone," Jim said, then nodded at the valve. "Is there a problem with the water feed?"

"Nope. And there isn't going to be. Mineralization was messing with the

seal, and you wait until that's bad enough for a little erosion, you might as well print up a new one, y'know?"

"I at least have it on good authority. That's close enough for me."

Amos snapped the welding torch into its place and pulled a polishing cloth out of his pocket. "We need to get the fuck out of the slow zone. Hanging out here like this is making my scalp crawl."

"Yeah. As soon as Naomi gets through her data, decides for sure where we're going," Jim said. "I'm worried about the kid."

"Yeah. Me too."

"It's easy for me to forget how much she's lost, you know? Her entire experience was curated to the millimeter before she came with us. A few months here—just enough to get comfortable and find her feet—and now another total change. It's a lot. She's fifteen. Can you imagine facing all that at fifteen?"

Amos looked over at him like he'd said something funny. "You stressed over Tiny? She's going to be fine."

"Is she? I mean... What do we even know about this school we're taking her to?"

"We know it gets shot at less than we do."

"Besides that."

Amos put the cloth over his thumb, took a firm grip on the valve, and started rubbing away the scorch marks as he talked. "Tiny's working out who she is. Shit, *what* she is. It's what she was doing on Laconia. It's what she's doing here. When she goes to that school, it's not like the job changes. The question is, does she have more to learn from a boarding school at the ass end of nowhere or getting missiles thrown at her with a bunch of old-fart revolutionaries?"

"I don't think we're really revolutionaries."

"And," Amos went on, raising his voice to keep Jim from changing the subject, "it's not what's really eating you. We both know that."

Before Jim could reply, Alex's voice came over ship-wide. "Hey, everybody. I was hoping... I kind of need to call a little group meeting? In the galley. If you can. Um. Thanks."

Amos squinted at the valve, turning it one way and then the other before giving it a last, satisfied swipe with the cloth. He set it back in its clamp.

"Do you need to put that back in place?"

“Nah,” Amos said. “I got a spare holding the line for now.”

“Then I guess we should go see what’s up with Alex.”

“He wants something, but he needs to apologize for a few minutes before he asks.”

“Well, sure,” Jim said. “I mean, I wonder what he’s going to ask for.”

If there had been gravity, Alex would have been pacing when they came through the galley door. Teresa was already there, floating beside the wall without touching it. Her arms were crossed, her mouth was tight and small, and every now and then she moved her jaw and made some brief expression. If he had to guess, Jim would have said she was deep in conversation with herself and barely paying attention to them. Amos took a place at the table, rooting himself by his mag boots to keep his hands free to steady Muskrat. The dog seemed perfectly at ease, reassured by having so much of its pack together.

Naomi came last and pulled herself a bulb of tea while motioning to Alex that he could start.

“So, yeah,” Alex said. “You all heard about Kit and Rohi, right?”

“You may have mentioned it,” Jim said, teasing him, but gently. Alex grinned.

“So I did the math, and I’m pretty sure that the baby’s already born. Now, I know that we’ve a lot on our plates here. The work we’re doing is really important. And risky. I didn’t sign on to any of this thinking it was like a normal contract. This has never been a normal contract.”

Amos’ sigh was almost inaudible. Alex heard it anyway, and Jim could see the old pilot dropping minutes of talking around the subject.

“Communication is dangerous, for him and for us, but I would really like to... to send my boy a message, you know? Maybe get a picture of my grandson. I don’t know what we have or what the underground needs from us. If we can’t... I just had to ask. You know, if it was something we could, and I just didn’t...”

Jim turned to Naomi and lifted his chin, asking. She took a sip from the bulb.

“It would mean poking our nose through the Sol gate,” she said. “We could get a tightbeam through trusted repeaters from there.”

“Any gate’s just about as far as any other one right now,” Jim said. “I mean, we’d just have to keep pretending we were on the same fake contract

as before. Even if Laconia has forces in the system, there's no better system to get lost in the traffic. Sol's got a few centuries' worth of ships and infrastructure to blend in with. It's not like we'd be trying to go unnoticed in Arcadia or Farhome."

"It would be more risk," Alex said, but he was just trying to tell them that he wouldn't be angry if they said no. Jim, Naomi, and Amos had all shipped with him long enough to know that was true. He wouldn't be angry, but he would be sad. And if they were all going to die anyway, there was no reason to miss the chance.

"I think we should go," he said.

"I was hoping we could drop Teresa off at school and then head for Firdaws," Naomi said.

"The Sol gate's right here," Jim said. "A quick burn. If there aren't any guard ships right at the ring gate, we can flip as soon as we've passed through the gate."

Amos scratched his neck. "We got enough water out of Kronos. We're not hurting for reaction mass. We could probably make up the time by burning a little longer to and from New Egypt. We are still hurting on fuel pellets and recyclers, but a little detour like that won't matter for those."

"Fine," Naomi said. "Sol gate for long enough to contact Kit, then New Egypt. We resupply in Firdaws."

"That work for you, Tiny?" Amos asked.

Teresa snapped back to the room from wherever she'd been. There was a bright sheen of tears over her eyes. Not thick, but present. "Yes. Fine. Yes."

Alex's relief melted him. When he spoke, his voice was reedy and thick. "Thank you. Really. If we hadn't, I'd have lived with it, but... just thank you."

"Family's important," Naomi said, and Jim couldn't tell which of the thousand things she could have meant by it were in her mind.

It took less than an hour to get the *Roci* ready to go, even with Amos swapping and testing the repaired valve. Alex, on the flight deck above them, was singing to himself like a finch at dawn. There wasn't a melody to speak of, just the musical lilting of pleasure and anticipation. Amos, Teresa, and Muskrat were in engineering, and Jim was thinking about all the things the girl might be feeling. Abandonment. Anger. Rejection. He hoped it wasn't like that. Or that at least there were other things—anticipation,

curiosity, hope—to leaven them. He hoped without any reason to hope that it would matter and that Teresa would by some miracle live long enough to work through the complications of her own heart.

As they started the burn for Sol ring at half a g instead of the usual third, Naomi sighed. At first, he thought her mind was on the same things as his.

“Too many fucking ships going through the rings,” she said. “And here we are, not exactly leading by example.”

He looked at the tactical. She was right, of course. Just in the time they’d been at a relative stop so that she could read through the data, ten more ships had passed through gates, burning on one errand or another that someone decided was worth the risk. Or didn’t understand that there was a risk. Or didn’t care.

“You saw there was another event?” Naomi asked. “There was a message from Okoye. It happened in Gedara system.”

“How many does that make?”

“Twenty? Something like that.”

Alex, above them, burst into a little run of melody. Something bright and jazzy, and as full as springtime. It was like listening to a message from a different universe.

“She’ll figure it out,” Naomi said, answering Jim’s silence. “If anyone can, she will.”

As they dove down toward the fluttering interference surface that was the gateway to Sol, a fast transit ship burst through the Laconia gate behind them, flipped, and started a punishing maneuvering burn. Jim watched them, waiting for the tightbeam demanding their surrender. It didn’t come.

“Looks like we skipped out at just the right time,” Naomi said.

“Another near miss,” Jim said. “Don’t know how many more of those we’re going to get.”

They passed through the Sol gate before they could see where the fast transport was headed.

Interlude: The Dreamer

The dreamer dreams, and her dream carries her and hers flowing backward into a time before minds. Like grandmothers telling the stories their grandmothers told about their grandmothers before them, she falls gently and forever into black oceans the size of everything. The other two are and aren't and are again, with her and within her like humming to the memory of songs she never quite forgot. She broadens like a sunbird spreading its wings to catch the warming light, but there is no sun and no light—not yet—and the cold darkness is wide and comforting as a bed.

And she knows things.

Once and gone so far away no one was there to think it, the *it* was like this: Down was the hardness of heat, and up was the hardness of cold, and between those two implacabilities was the universe. The dreamer dreams the currents of flow and force, and her blood is the ocean's blood. Her salt is the ocean's salt. With a hand as wide as continents and softer than her skin, she caresses the burning heat below her and the soothing cool above. Long eons, and nothing is alive until something is. Maybe many things are, but the dream is a middle dream, and she dreams the middle because the path that crooks her swimmingly on begins there, but slowly slowly slow.

The dreamer drifts and the others drift with her, and more now: little bulbs of pastness around her and within, drifting on the same flow that she is and that she *is*. Two touch and become one; one thins itself into two and two and two and two. She watches the languid, lightless stuttering in the blessed cold as the grandmothers whisper that here is the birth of lust. Here, the puppy-wise gambol of making for the joy of making, with nothing to make of but from self more self.

The dreamer forgets, and is the slowness. She reaches over timelessness and invisibilities, thirsty for something richer than water. Thimble feasts rise from below and sate her for decades, and she dreams that she is

dreaming, safe inside the eternal flow. Her hand reaches up to her heel, fingertips stretching ahead to brush her toes. She is a child made of saltwater bubbles, and one of the others says so, *like cells?* but the words are another place and she is voluptuous now, outside all language.

There is no light—not yet—but there is heat far far below, stuttering and buzzing and raging. It boils up the strange taste of stones that draws her and drives her away and becomes her. Above, the cold where nothing flows, the endless curving wall around the universe. And the ripple, now the always-ripple of a flow inside the flow that only some things feel. A handhold in the waters, a something made from nothing that she shimmies wrigglingly along. She presses herself against it, and lusty, she improvises. The little bulbs of pastness complicate and reach, one for another. And for the first time in all of time, she is tired.

Watch watch watch, the grandmothers whisper. *Feel that one that falls, slipping down too far into the heat and riot; that mindless genius. This is important*, they say, and the dreamer draws herself down too and others how many with her sink. The bubble rises, full of thrum and fever and ill, and when it cools, it is butterscotch on the tongue and a billion insects choiring joyful in the summer night. It is a thousand new toys wrapped in gauze and ribbon. It is coffee and candy and the first awkward kiss, the almost-almost-almost shuddering against the skin. And she knows she will go again, that she who is a child of bubbles will send herself away again to be burned and then cherish her blisters. She longs to be made strange by the hotness and the hurt.

This is how it was when we were girls, the grandmothers say, and the dreamer dreams that she understands.

That's enough, someone says. *All right, people. By the numbers and by the book.*

Chapter Eight: Elvi

Fayez, floating at her private desk, scrolled through the notes. Whenever he was confused or skeptical, a little line appeared between his eyebrows. “So does this make any fucking sense to you? Because I’m baffled.”

The notes had the scans of Cara’s brain and body and the ones of the BFE, but the important part for Elvi was the interview and subject report with Cara. It had taken them hours to complete, Elvi asking questions and Cara answering verbally or writing out her reply, and while it was the least objective thing in the report, it was also the thing that excited her most.

“It does. I mean, I think it does,” Elvi said, and paused. “I have some ideas.”

He shut down the window and turned his attention to her. “Maybe you better tell me, then. Because I don’t know what I’m looking at here.”

She gathered her thoughts. Exobiology hadn’t been Elvi’s first field of concentration. Back in the dim and ancient times that were really just a few wild and change-filled decades before, she’d gone to Sejong World College because it had the best medical genetics program that she could afford. When she was being honest with herself, it wasn’t even that she loved medical genetics all that much. When she was fifteen, she’d seen Amalie ud-Daula play a medical geneticist in *Handful of Rain*, and she spent the next year trying to get her hair to look the same. She never really managed. The weird alchemy of adolescent imprinting transformed her unconsidered identification with an entertainment feed actor into an interest in how strands of DNA turned into pathologies.

The idea of a flaw as tiny as a missed base pair translating itself into a slightly different curve on a protein and then into a leaking heart valve or a nonfunctional eye was compelling and creepy in more or less equal degrees. She thought that it was her passion, and she’d followed it with the dedication of a woman who believed she was on the path the universe

wanted for her.

She'd taken a course on non-terrestrial fieldwork because her advisor had pointed out how many more postings there were for newly graduated medical geneticists on Mars and the stations on Jupiter's and Saturn's moons than there were on Earth. Elvi had taken the hint.

Lectures had been held in a small room with yellow, water-stained carpet and a wall screen with a burned-out pixel that made it look like there was a fly on it. Professor Li was three years into his retirement, and only came back to teach the class because he liked it. Maybe his enthusiasm had been infectious, or maybe it had all been the universe's way of putting her in the right place at the right time. Whatever the reason—or lack of reason—Professor Li had done a section about the first explorations for extraterrestrial life in the oceans of Europa, and Elvi's brain had lit up like someone had put euphorics in her breakfast cereal.

To the dismay of her mother and her academic advisor, she changed her focus to the then-purely-hypothetical field of exobiology. Her advisor's exact words had been *From a work perspective, you'd be better off learning to tune pianos.*

And that had been true right up until Eros moved. After, everybody in her program had jobs for life.

She was older now than Professor Li had been when he told her about Europa and those first tentative efforts to show that Earth's tree of life wasn't alone in the universe. She'd seen things she hadn't dreamed of, been places she hadn't known existed when she was a girl, and found herself—thanks to chance and James fucking Holden—at the razor's edge of the most important research projects in human history.

Strange then, how it all cycled back to Professor Li's lecture about Europa. Cold dead Europa, which had turned out to never have had any life in it but opened up the universe to her anyway.

Elvi steadied herself with a handhold. She'd been on the float enough that it came almost naturally now. She still missed being able to pace. "Okay. How much do you know about the slow life model?"

"I am now aware that there is something called a slow life model."

"Right. Basics. Okay. So, there's a range of metabolic rates. You can see that in animals. You have something fast with a high reproduction rate like rats or chickens on one hand, and tortoises with a really long lifespan and a

much slower metabolism on the other. The whole tree of life is on that spectrum. It predicts that you'd see things evolving in very low-energy environments that, y'know, needed very little energy. Low metabolisms, low reproduction. Long lifespan. Slow life."

"Space turtles."

"Ice turtles. Actually, very cold saltwater slugs. Or jellyfish. Probably something pretty near neutral buoyancy. That's not the point. You could in theory have something evolve in an environment with very little available energy, and with a very... let's call it 'leisurely' sense of time. It's what the Tereshkova missions were looking for."

"And that's awesome," Fayez said, blankly.

"Tereshkova One and Two were the first long-term crewed surveys of Europa? They were looking for extraterrestrial life."

"Which they didn't find."

"Some amino acid precursors, but no life."

"So the space turtles weren't from Europa."

A brief flash of annoyance rose in her and faded. They were both tired. They were both in the only ship in an unpopulated solar system with help weeks away at best. And she wasn't explaining herself that well. She swallowed, set her shoulders, and went on.

"They weren't. But maybe they were like what we were looking for. And here's the other thing. The other form of life the Tereshkova missions were looking for was deep vent organisms."

"Those I know. Worms and things that live near volcanic vents. They use the energy from the vent instead of sunlight."

"And they also get a bunch of biologically interesting minerals, but yes."

"Start talking vulcanism, and I know my way around," Fayez said.

"That's what Cara's describing. That biome. Look. She talks about the cold above and the heat below. Like the ice shell of a water moon with a hot core. And free water in between. The part where she says she felt it starting to make more of itself. That's... I don't know. Some kind of reproduction. Mitosis or budding."

"And the thing where she tasted stones," Fayez said. "Minerals and nutrients floating up from below. You're thinking they're both there. These slow life turtles—"

"Jellyfish."

“—and vent organisms too, but lower down.”

“Like what we were looking for on Europa.”

The line on his forehead erased itself. She wanted to keep going, but she knew her husband’s rhythms. He was working something through, and if she talked now, he wouldn’t hear her. The hum of the ship around them and the ticking of the air recycler were the only sounds until he laughed once, like a cough.

“Okay, I know what I was thinking of,” he said. “The part about the thing in the water.”

“The handhold?”

“Yeah, that. It happened after the... fuck... tasting stone? Seriously, I feel like we should have brought a poetry grad student along. This is bullshit as data.”

“You were thinking of something?”

“Right, sorry. If that was some kind of impressionistic, experiential description of iron uptake leading to magnetic navigation. Maybe that’s the handhold in the water?”

“And that thing at the end,” Elvi said. “When something went down into the heat and came back up scarred, but with this... revelatory whatever it was? If that’s the slow life intentionally reaching for a nutrient-rich environment for the first time. Seeking out food instead of just bumping into it. I think Cara is experiencing this organism’s evolutionary history. The diamond—”

“Thank you for not calling it an emerald.”

“—is showing her how they came to exist. Like if we were explaining life to something that had never seen anything like us by pushing down to organic chemistry and building the story up from there so that we’d have a common context.”

Fayez went quiet. The line on his forehead came back. Elvi pushed off the wall, turning to take the edge of her desk in her fingers and pull herself to a stop. He saw her expression and shook his head.

“No, it makes sense. Sort of. I see why that would be the best information-sharing strategy and all that. It’s just. Okay, say the protomolecule engineers have gotten us up to the part of their story where they were like hamsters avoiding the dinosaurs. I don’t mean to be an asshole, but... so what?”

Elvi didn't know exactly what she'd been expecting him to say, but it hadn't been that. "So we know something about what they are. This could be the origin of the species that established a vast galactic presence and overcame a bunch of things we always thought were laws of physics? That's a big deal."

"It is. I hear you. But it's so far back, sweetie. If Cara could ask the diamond maybe the top five ways to keep vast monsters from beyond time and space from killing everyone, that might be a better place to start."

"Only if she can understand the answer."

"And if they knew. Which evidence suggests they didn't. I mean that elaborate gamma-ray burst trap in Tecoma system was just them wiring a shotgun to a doorknob. Even if we know everything about the space jellyfish, is that going to be enough?"

They fell silent. Elvi knew the solid feeling at the center of her gut. It was always there these days. The only thing that changed was how aware of it she was. She anticipated what he would say next—*What are we doing here?*—and her own reply—*The best we can*. But he surprised her.

"It's going to be okay."

She laughed, not because she believed it but because it was obviously untrue. And because he wanted to comfort her, and she wanted to be comforted. He took her arm, drawing her across the open desk, and pulled her beside him. His arms enfolded her, and she let herself curl against him until they were floating together, his head at her shoulder, his thighs under hers, like twins in the same amniotic sac. It wasn't an image she thought other people would find heartwarming, but she did. And when she was alone with Fayez, other people weren't important. His breath smelled like smoky tea.

"I'm sorry," she murmured. "Baby, I'm so sorry."

"For what?"

"All of it."

"It's not your fault."

She pressed her cheek to his head, felt the scratch of his hair against her cheek. Tears were sheeting across her eyes, making the office swim like she was underwater. "I know. But I don't know how to fix it, and I'm supposed to."

She felt the subtle expansion and collapse of his sigh. "We are hailing an

awful lot of Marys, aren't we?"

"We're making progress. We already know so much more."

"You're right. I'm frustrated. I didn't mean to piss on the project," Fayez said. "If the answer's anywhere, it's here."

She nodded, and hoped that was true, and that the growing sense she felt that there was something important—critical—in her notes that she'd missed was right. And that whatever it was, she could find it in time.

Later, when Fayez had gone to get some sleep, she went through a packet of reports from Ochida. The high-energy physics workgroup had their most recent data ready for review. The latest complex modeling outputs mapped possible connections between the attack on the *Typhoon*, the uptick in virtual particles in Tecoma system, and the initial loss of consciousness after the *Tempest* had destroyed Pallas Station. A surveying company that usually did mining operations around Jupiter was trying to find the weird magic bullet that had been frame-locked to the *Tempest* when it was destroyed. Her own computational biology group was setting up a distributed study that would put subjects in NIRS imaging around the clock in every populated system in hopes of catching good data the next time the enemy flicked consciousness off. And all the reports were being dumped through massive virtual pattern-matching arrays on Earth, Mars, Laconia, and Bara Gaon in hopes that machine intelligence might catch something the humans had overlooked.

It was the broadest, best-funded research effort in the history of the human race. A million people searching through a haystack the size of 1,300 planets and hoping there was a needle in there someplace.

She sometimes wondered if this had been Duarte's plan all along. Push and push until solving the ring entity problem was forced into first position for all humanity. He'd always held that it was a problem they'd have to solve sooner or later, and humans did tend to do their best work when survival was on the line. But whether it had been the high consul's intention or not, humanity had one problem it was trying to solve now. And James fucking Holden had somehow managed to put her in charge of it.

She didn't know whether looking over the vast effort calmed her or keyed her up. Maybe both.

When she reached the end of the packet, she closed down her screen. There were a couple dozen things that she, as head of the Laconian Science

Directorate, needed to authorize or comment on, and she would. But after she'd had some food and maybe a nap. If she could sleep.

She pulled herself through the ship, floating down the corridors. Cara and Xan were in the galley with Harshaan Lee and Quinn de Bodard, and Elvi watched them as she decanted herself a bulb of lentil soup.

"Major," Harshaan Lee said, nodding to her as she floated over.

"Doctor," Elvi said, and took a mouthful of soup. The *Falcon* made good food. The lentils tasted almost fresh—like nutrition and mud and comfort—even though they were probably made from textured fungal proteins.

"We were just talking about *Koenji Wizard*," Quinn said. "It's an entertainment feed out of Samavasarana system."

"I don't know it," Elvi said, and Xan, spinning slowly about his z-axis, launched into a description of the story. It involved a hidden space station built by angels that were also human desires in physical form. And apparently there were a lot of songs, one of which Xan sang. Cara joined in for the chorus. Elvi listened and, to her surprise, felt herself beginning to relax. Xan's enthusiasm and the benign, childlike narcissism that drove him to the center of every conversation were actually a joy. For a few minutes, Elvi was out of her own head. It was easy to forget that he'd been a seven-year-old for over forty years now.

She almost regretted coming back to herself.

"Cara?" she said, nodding toward the other side of the common room. "Could I borrow you for a second?"

The girl who wasn't a girl froze the way that she and Xan did sometimes, suddenly going as still as stone. It only lasted a moment, but it was eerie every time. Then she nodded and pushed gently off in the direction Elvi had indicated. Elvi tossed her empty bulb in the recycler and floated over to meet her. Xan, still with Quinn and Harshaan, blinked anxious black eyes at them, and Elvi waved what she hoped was reassuringly.

"What's on your mind, Doc?" Cara said. Her casual informality left Elvi feeling warm toward the girl every time she heard it. For someone who'd been imprisoned and experimented on for decades by an induced sociopath, Cara had given her trust to Elvi quickly.

"Couple things. I wanted to see how you were feeling. The last dive

was... There were some interesting readings. It looked like you were in a different kind of sync with our big green friend. It was looking more like a nonlocal reaction than something with light delay.”

“Yes,” Cara said, so quickly it was almost interrupting. “I felt like that too.”

“And since we don’t know what this is, I need you to tell me how you feel. Are you all right?”

“I’m fine,” Cara said. “Going in there like this seems... I don’t know. It feels good. It feels *right*.”

Which Elvi knew already. She’d seen the scans and knew what the connection was doing to Cara’s endorphin levels. It was anthropomorphizing to say that the BFE wanted Cara to come back. There was no reason to think it had any will or intentions. But it wanted the girl to come back.

Somewhere deep in her mind, Elvi knew that what came next was a mistake. And that she’d chosen to make it.

“Given that,” she said, “I’d like to consider accelerating the session schedule. If we could take a day or two less between the dives—”

“That would be great,” Cara said. “I don’t think there’s any reason not to. I can handle it.”

Her grin was so genuine—so human—that Elvi couldn’t help grinning back. “All right then. I’ll talk with the team, and we’ll get a new protocol schedule out. Maybe we can try another run as soon as tomorrow?”

Cara gave a little shiver of excitement, and from across the common room, Xan frowned and looked anxious. More than anxious. Melancholy. Elvi took Cara’s hand, squeezing her fingers, and Cara squeezed back. A human gesture of connection, as old as the species.

“It’s going to be all right,” Elvi said, not realizing until she heard herself that she was echoing Fayez. That she hadn’t believed it when he said it.

“I know,” Cara replied.

Chapter Nine: Kit

His father looked out from the screen, eyes red from happy tears. Probably, Alex Kamal had wept over Kit the same way once, but Kit had been a baby then. He didn't remember it, and so seeing it now felt like the revelation of something new.

"I am so proud of what you and Rohi are doing. The life you've put together. It's—it's—it's hard to understand what it means to make a family. To bring a new person into the world. But now that you have, I hope you can see that's the love we had for you. Me and your mother both. It's overwhelming. This is everything I hoped you could find. And I know—I *know*—that you'll be a good father. A better father than I was."

"Oh, fuck, Dad," Kit breathed. "Are we doing this again?"

"The bad things that happened were never about you. About how much I loved you. How much I do love you. I am so full. What you've done, it just leaves me feeling so full. I'm so happy. I'm so happy for you."

The message ended. It was five full minutes long, and Kit wasn't sure he had the stamina right now to listen to it again. It was easy for his father to romanticize Kit's life. Distance and the political dangers of their contact meant Alex could only see a small part of a very large picture.

He checked the time. There wasn't much to say, and most of it wasn't something he'd want to put on Alex's shoulders anyway. If Aunt Bobbie had still been alive, maybe he'd have turned to her. She'd had a way of seeing to the heart of a thing. Compassion without sentimentality. His father was carrying too much baggage for that, and Kit still couldn't help protecting him.

He started the recording.

"Hey," he said into the camera. "I want you to know that I really appreciate you coming close enough to swap these messages close to real time. More often than not, I send you something and I just have to hope you

even got it... Shit.”

He stopped the recording, deleted it. He didn’t want this to devolve into another round of Alex whipping himself for not being more present in Kit’s adolescence. The issue carried more guilt for his father than any resentment from Kit. It was just that he had too much right now to add on the burden of one more person’s emotional well-being.

But he had to say something.

The door chime saved him for the moment. He dropped his comms and told the door to unlock. His mother breezed into the apartment the way she always did. She was a stately, strong-jawed woman who wielded the nobility of her features like a club. Kit loved her and he always would, but he liked her more when she was on a screen.

“Where’s my baby?” she said with a grin. She didn’t mean him.

“Rohi’s changing his diaper,” Kit said, gesturing toward the back room with his chin. “She’ll be out in a minute.”

“Rokia!” Giselle said. “Grandma’s come to help.”

Rohi hated it when people not from her birth family used her full name. From the day his mother had found that out, she’d never called her anything else. Kit understood that she meant it as a statement of love and acceptance. He also understood it was a power play. The apparent contradiction of being both things at once made sense to him in a way it didn’t to Rohi, but he’d been raised with it. The dysfunctions and idiosyncrasies of childhood became the self-evident norms of adulthood.

He listened to their voices—Giselle’s and Rohi’s and the gabble and fuss that was Bakari. He couldn’t make out the words, but he knew the tones. Mother’s imperiousness compensating for her insecurity. Rohi’s polite kindness that masked her annoyance. And the baby’s vocalizations, still too new to mean anything to Kit but his own joy and exhaustion.

A minute later, the three of them came out together: his mother, his wife, and his son. Giselle already had Bakari on her hip. Rohi’s smile was strained but patient.

“Grandma’s here,” his mother said. “I am in control. You two lovelies go off and enjoy your date night while I play with my perfect baby boy.”

“We’ll be back after dinner,” Kit said.

“Don’t hurry,” Giselle said with an airy wave. Rohi’s eye roll was so small it was almost subliminal. Kit bowed to his mother, kissed his

confused son on the top of his head where the bones hadn't yet fused, and then he and Rohi walked out to the public corridor and closed the door behind them. The last thing he heard was Bakari starting to wail as he realized they were leaving.

"Date night?" Rohi asked as they walked down toward the local hub.

"It was easier than 'Rohi and I need to have an uninterrupted conversation,'" Kit said. "It would have been half an hour of her telling me why divorce is bad. This way, there was no lecture."

He had hoped she would laugh, but her nod was sharp, short, and businesslike. She didn't take his arm, and her gaze stayed locked on the walkway before them. The common corridor was bright, and the plants on the median shifted their broad leaves in the breeze of the recyclers. They'd taken positions at Aterpol on Mars with the understanding that it was both a center of research, second in the Sol system only to Earth, and a more congenial place for pregnancy than any of the deeper stations except maybe Ganymede. Giselle had been delighted, and Rohi had too, at first.

They came to the noodle bar that had been their habitual off-shift hangout. A young man with an untreated acne problem and a dombra sat on a little dais, plucking a gentle melody and being ignored by the people eating at the tables. Kit sat, Rohi sat across from him, and they ignored the music too.

"Do you want to order first?" Kit said, careful to keep his voice neutral.

"Yes," Rohi said. It didn't take more than a moment to key their preferences into the table and have the system confirm them. They sat in silence for the three minutes before old Jandol came out with their bowls—lemongrass and egg roll for him, com chiên cá for her. That she'd ordered one of her comfort foods meant something to him. Jandol nodded to them both, missing the tension or else ignoring it, and went back to the kitchen. Rohi leaned in over her bowl.

"Well," Kit said. "What's on your mind?"

"Hear me out, all right?"

He nodded her on.

"I think we should look at postponing the contract again."

"Rohi—"

"No, hear me out." She waited until she was sure he'd be quiet. "I know Mars is only a third of a g, but it's a consistent third. Always-on gravity is

really important in the first few months of development. His inner ear is still forming. His bone growth is starting. He'll be going through a lot of fundamental changes in the next year, and even if we're on one of the fast ships, we'll still be on the float for months. I don't want him to grow up with any of the low-gravity syndromes. I don't want to start his life by changing his body in ways that give him fewer options later on. Not if I don't have to."

"I hear what you're saying."

"I've looked at the schedule. There's three other parts of the team who could take our berth on the *Preiss*. We'd still be in the date range if we switched to going out on the *Nag Hammadi*."

"Assuming we got on it," Kit said.

"I'm not saying don't *ever* do it," Rohi said. "I'm not saying *cancel* the contract. That's not what I *meant*."

A fat, slow tear drifted down her cheek, and she wiped it away like it had betrayed her.

Kit took a deep breath, and let it out. When he spoke, he spoke carefully. "You're crying."

"Yeah. Well, I'm scared."

"What are you scared of?"

She looked at him, incredulous. Like the answer was obvious. It was, but he thought it was important for her to say it out loud anyway.

"I'm suggesting that you compromise your career," she said. That she'd said *your* career, not *our* careers, was everything. Kit thought he'd understood the dynamic between them, and now he knew he was right. The corners of her mouth tugged down, and he could see for a moment what she'd looked like as a child, long before he met her.

"Okay," he said. "My turn?"

She nodded.

"Here's the first thing," he said. "I'm not my father. And I'm not your mothers. I'm not going to make the decisions they made. You and Bakari are my first choice, every time. I'm not going to leave, even if it means cutting off a career path."

"I just—"

He took her hand. "Hear me out?"

She nodded. The next tear, she ignored.

“I know this isn’t the perfect time,” he said. “But there’s never going to be a perfect time. There will always be something. Bakari’s development or my mother’s health or a conference we won’t be able to come back for or something. There’s always something.”

“Until Laconia decides to start another war to prove a point. Or the aliens kill us all.”

“I can’t control any of that,” Kit said. “All I can do is keep acting like the universe is going to keep existing and planning for a future in it. Nieuwestad is one-point-two g. It’s going to be hard on him, and us too. Jacobin-Black Combined Capital is a good company doing the kind of work we want to do, but that doesn’t mean we have to do it. We can break the contract and find something else. Or we can go and do the best we can. If we go, there are a lot of good programs for helping kids and babies with gravity transitions. And I’ll get up to go to the gym with you every day if you want. If we stay here, there are other jobs. We can do anything. But we’re going to be doing it together.”

Rohi’s eyes were red now, and she wiped the tears away with her napkin. “This is stupid.”

Kit took her hand. “You get scared when we talk about balancing the family and work, and it’s okay that you do. I get it, and I love you, and a good cry is just part of the way we talk about this stuff. And you never judge me when it’s my turn to be the weepy one.”

“I just don’t want to mess things up,” she said. “What if we mess things up for him?”

Kit stroked her knuckles with his thumb the way he did when she couldn’t sleep. “We will, though. No one’s perfect. Everyone’s carrying something that their parents would have done differently if they’d known. Or if they’d been better people. Or if things had just been different. That’s all right. It’s normal. Part of why I am what I am is all the bad choices my mom and dad made, and if they’d done differently, they’d still have made some mistakes somewhere along the line, and those would be part of me instead. They weren’t perfect, and we aren’t perfect.”

“He is, though,” Rohi said. “Bakari is.”

“He is, isn’t he?”

They were quiet for a little while. Jandol came out and offered to take their leftovers away. When Kit shook his head, the old man shrugged and

puttered back to the kitchen.

Eventually, Rohi hauled in a breath, and when she sighed, she folded forward. When she spoke, her voice had lost its tightness. “All right. Thank you.”

“Don’t say ‘I’m sorry.’”

“I didn’t.”

“You were about to.”

She smiled, and he could see the storm had passed. “I was about to.”

He sucked up a mouthful of noodles and chewed. The lemongrass tasted real, and the noodles were soft and salty. If they’d gone a little cold, he didn’t care. Rohi sighed and relaxed into her chair.

After dinner, they walked home slowly. She took his hand, and he leaned against her. For a while, it was almost like they were courting again, only deeper. Richer. Fuller. This was the life that both of their parental groups had given up, and Kit didn’t understand any of them at all.

At the rooms, Giselle was sitting on the couch, spooling through entertainment newsfeeds on her handheld. As they came in, she lifted a finger to her lips and pointed toward the nursery.

“He fell asleep ten minutes ago,” she said. “Ate well. Shat out his bodyweight. Giggled, played, cried for fifteen seconds, and out.”

“Thank you, Mama,” Kit said, and Giselle stood up and wrapped him in her arms.

“It’s not for you,” she said, quietly enough that only he could hear. “I’m soaking in all the grandbaby I can while I have him. Storing up for winter.”

After she left, Rohi went to her office, walking softly to keep from waking the baby, and he sat at his own desk and pulled up his message queue.

He started the camera.

“Hey, Dad. I love you too. Thank you for coming close enough to send the message. I know how hard that can be. And I love you for it. Having a kid is the scariest thing I’ve ever done, and I love it. I love having a kid. I love being a dad.

“I know you and Mom didn’t have things go the way you’d have picked. But no matter what happened, I always knew you cared about me. I learned that from you. If that’s the only thing I manage to pass on, it’ll be worth it. It’s a great legacy. Seriously the best.”

He tried to think of something more, but exhaustion was seeping in at the corners of his brain, and he didn't really know what else there was to say. He reviewed it, sent it, scrubbed his system the way he always did when he'd gotten something from the underground's network, then showered and got ready for bed.

Rohi wasn't there. He found her standing over the crib, looking down at the new little life they'd made together. Bakari's soft, round belly rose and fell as he slept. Kit stood there with her and with him.

"He's a strong little guy, isn't he?" Rohi said.

"He is. And his parents love him."

"Okay, then. Let's go."

OceanofPDF.com

Chapter Ten: Fayez

Planetary geology wasn't the sort of degree people usually went into looking for a career as a kingmaker. There wasn't a lot of crossover between freshman analysis of sedimentary patterns and having people vie for your influence over issues of life and death. Add in political sway over a galaxy-spanning empire, and the overlap was pretty narrow.

But without intending to, Fayez had stumbled into it.

He was floating in Lee's private cabin with a bone-colored bulb of whiskey in one hand. It was a thick, peaty distillation that was too harsh for him when they were under thrust. A couple weeks on the float did something to deaden his taste buds, and so at times like this, it was perfect. Lee, Elvi's second-in-command, was queuing up a message from home. Or, at least, from Laconia. Which despite having lived there for years, Fayez still didn't think of as home.

"Here," Lee said, pushing back from his station.

"Okay, who am I looking at?" Fayez said.

"His name is Galwan ud-Din," Lee said. "He's a senior researcher in extrapolative physics."

"Right. So I'm not going to understand this at all, am I?"

"I told him to give you the educated layman's version."

The screen flipped to an image of a thin-faced man with a vast and well-trimmed beard and a collarless formal shirt. He nodded to the camera in not-quite-a-bow. "Thank you for your time, Dr. Sarkis. I want you to know how much I appreciate it."

Since it was a recording, Fayez sighed.

"I wanted to share with you some thoughts my workgroup has put together. I think you will find them very promising," the thin-faced man said, then visibly gathered himself. His expression settled into the thing Fayez expected on grade-school teachers who were trying to be

approachable. “Light, as I’m sure you know, is a membrane phenomenon on the surface of time.”

Fayez drained the bulb of the last drop of whiskey and put his hand out for another. Lee had it ready.

For half an hour, ud-Din made what in the end was a surprisingly comprehensible case that Elvi’s slow-life jellyfish had ended their evolutionary arc as a complex, vastly distributed brain-like structure that relied on the counterintuitive truth that time dilation put photons in a state of instantaneous emission from a distant star and absorption by an observing eye even if they seemed to outside observers like Fayez to travel for years in between. The rate-limiting step on a system like that would always be mass, and so technologies for moving mass—inertia manipulation, “shortcut” ring gates—would be prioritized, which evidence suggested they had been.

By the end of the presentation, Fayez felt almost as excited as ud-Din seemed to be, and he hadn’t even finished his second whiskey.

“You see, I hope,” ud-Din said, “why I am so hopeful for this path of research. Which is why I need to ask your help. The new orders from the Science Directorate putting us at the beck and call of Colonel Tanaka... I don’t dispute that the high consul has the absolute right to direct our efforts as needed, but you have his ear. If you could encourage him to refrain from interrupting our research unless it is critical to the empire. I... I only say it because I feel we are on the verge of a breakthrough, and I would hate for the high consul to make his decisions about our workgroup without a full understanding of our situation. Thank you. Thank you for your time.”

Ud-Din licked his lips anxiously and the message ended. *How charming to pretend there’s still a high consul running this bumblefuck*, Fayez thought, but didn’t say aloud. Some things were too dangerous, even for a kingmaker.

“I have half a dozen like this,” Lee said. “Workgroup and research leads who got the message to do whatever Tanaka asks. Several of them, she has already retasked.”

“They know we can’t do shit about it, right? Because we literally can’t do shit about that. You got the brief about what Tanaka’s doing?”

“I did,” Lee said, and then pointedly didn’t expand on it. “We have a great many absolute top priorities. We can’t do them all.”

“I get that,” Fayez said. “But Elvi’s not the one setting them. She’s been very open about letting expertise place the goalposts.”

“But she is the adoréd saint to Duarte’s Holy Ghost,” Lee said. “People want her to intercede for them.”

“And so they ask you to ask me to ask her,” Fayez said. “No, one more. So that she’ll ask him. Or, functionally, Trejo.”

“Yes.”

“The way we do things, it’s amazing humans ever figured out shoes. I’ll talk to her, but you know how she is right now.”

“I do. Thank you, Dr. Sarkis.”

“Keep plying me with drink, and you’ll wind up turning my head, Dr. Lee.”

Lee’s thin smile was as close to emotional intimacy as the man got. Fayez liked him.

The halls of the *Falcon* hummed and glowed. He navigated his way through them from handhold to Laconian-blue handhold. Some of the younger members of the crew launched themselves like Belters, zipping from intersection to intersection without touching a wall in between. He wasn’t that guy. Getting where he was going with all his cartilage intact had become a more interesting prospect in the last couple decades.

The thing about expertise was that it wasn’t actually transferable. Winston Duarte had cut his teeth in the MCRN’s logistics department, where he had apparently been an underappreciated genius. It was easy to see how his brilliance there had helped build his breakaway empire. He’d pulled it off, and by grabbing up samples of the protomolecule and the experts who could use it, he’d tamed enough of the alien technology to put all humanity under his heel. For a while, anyway.

Being good at something—even the best that humanity’s billions could offer—didn’t make him good at everything. It just made him too powerful to say no to. And so when he decided to make himself into an immortal god-king, not for his own benefit, but to selflessly provide the human race with the continuing stable leadership that it needed in order to storm heaven and kill God, he’d already talked himself and everyone around him into thinking he was as impressive as the story about him claimed.

Only a few people officially knew how badly that plan had gone. Elvi was one. Fayez was another.

He heard Elvi and Cara talking as soon as he came into the corridor for her lab. The door to Elvi's office was open, and Cara was floating in the open space between the workbench and the medical scanners. The young woman's—girl's—face was bright with excitement, and she gestured as she spoke, as if she needed to stuff more meaning into the words than mere syllables could hold. Elvi was strapped into her crash couch, taking notes as they spoke. Except for the part where they didn't look even vaguely genetically related, they reminded Fayeze of a grandmother and granddaughter bonding through solving some great puzzle. Even before he could make out what they were saying, the tones of their voices told the story. Giddy and enthusiastic was the good spin. Fevered and manic also fit.

"Then there was this sense of... of light?" Cara said. "Like we were eating eyes and it made me able to see."

"That actually fits," Elvi said.

"It does?" Fayeze said. "What does it fit into? Because I just learned a lot about light, and it was really weird."

Elvi's smile wasn't annoyed at all, and Cara's was only a little. "I think our sea slugs hit a milestone," Elvi said. "They already had a method of exchanging information through direct physical transfer, like bacteria trading plasmids. If we're getting this right, they formed a mutualistic relationship or successful parasitism with a little goo cap that could go down to the volcanic vents and come back up."

"Ooh. Dirty," Fayeze said, pulling himself fully into the room. With all three of them, it was a little tighter than comfort, but Cara grabbed the wall and made space for him. "How did the eyeballs come into it?"

"They harvested evolutionary innovations from the faster ecosystem. Something down by the vent figured out a rudimentary infrared eye so that it could navigate the vent. The slugs got it, put it on the signaling protein mechanism, and all of a sudden they didn't need to stick plasmids into each other to share information anymore. They could do infrared semaphore."

"No, it was light," Cara said.

"Maybe bioluminescence," Elvi agreed. "At that point, the very slow things started being able to talk very very fast. And they start looking a lot less like jellyfish and a lot more like free-floating neurons. Plus we already see the deep strategy of sending out semi-biological runners to inhospitable biomes and implanting instruction sets into whatever life they find there."

Which—I'm stretching here—starts sounding a lot like the protomolecule's mission on Phoebe..." Her voice trailed off. Her smile shifted to something more rueful. "But that's not what you came to talk about, is it?"

"There's a briefing you should totally listen to, but no," Fayez said. "I needed to talk about something else."

"Cara? Could we take a quick break?"

The black eyes were still for a fraction of a second, then flickered up to Fayez and away. "Sure. No problem."

Cara pushed herself to the doorway and out into the corridor, closing the office door behind her as she went. Fayez drifted to the medical scanners. Cara's readouts were still on the screens. He traced the curve of her stress metabolites. He wouldn't have known what they were, except Elvi had explained them.

"They're not as high as they look," she said, a little defensively. "We don't even really know what the upper boundary is for someone who's been modified like her."

"I didn't know you were doing another dive today," Fayez said.

"She felt up to it. That's not what you came for either, is it?"

He shut down the screens, rotated back to face Elvi, and braced on a foothold. "The Tanaka thing is a problem."

She had looked tired before he said it. She looked worse now. "What are we seeing?"

"She's reallocated and retasked four workgroups. Instead of doing deep background scanning, they're searching for an artifact that may or may not have left from Laconia and doing deep brain scans of Trejo looking for... I don't know what."

"Traces of manipulation," Elvi said. "Something that would show evidence that he'd had a direct neural link like the one James Holden and the remnants of Miller did on Ilus."

"So you know about this?"

Elvi made a vague, helpless gesture. "She outranks me."

"But you're the administrator of the Science Directorate."

"And that used to matter," Elvi said. "Not anymore. Right now, her orders might as well say, 'from the desk of God.'"

"These scientists want you to protect them from the bureaucracy."

"What they want is for me to talk Duarte into overriding Trejo and

getting her clearance pulled,” Elvi said. “There’s a problem with that plan.”

“That Duarte doesn’t exist?”

“That Tanaka will need to find him before I can ask him any favors, yes.”

Fayez was quiet for a moment. He didn’t want to go to the next place, but he had to. “Do you think that’s really what’s going on?”

Elvi’s sigh meant she’d had the same thoughts and suspicions. “You mean do I think Tanaka’s really searching for a version of Duarte that came out of his coma and disappeared?”

“Or is Trejo feeding us a story and seeing if it leaks out to the underground? This could all be a test. Duarte could be back at the State Building right now contemplating his oatmeal. We wouldn’t know until Dr. Lee gets a quiet order to put a bullet in the backs of our heads. We’re high in the food chain, but Trejo’s still an authoritarian despot, and there’s a lot of precedent for shit like that.”

“I can’t care about it,” Elvi said. “I can’t play the game. I don’t have the focus or the energy.”

“You can stop feeding our results to Jim and Nagata.”

Elvi nodded, but not in the way that meant she agreed.

Fayez pressed his fingertips into his closed eyelids. “Babe,” he said, but she stopped him.

“It’s happening more than we thought.”

“What? What’s happening?”

“The incidents. Like Gedara. We’ve only been seeing the near misses. We always catch the ones that turn off consciousness, but I had Ochida run through pattern matching for other anomalies like Gedara’s lightspeed thing? They’re happening all the time.”

“What do you mean, all the time?” Fayez said, but his gut had gone suddenly cold.

“Changes in virtual particle annihilations in Pátria, Felicité, and Kunlun systems. Lightspeed variations in Sumner and Farhome. Electron mass changed in Haza system for almost two minutes. *Electron mass*. Sanctuary system had gravity increase by a tenth of a percent throughout the system for six seconds.”

“Okay, every single thing you just said fucks me up.”

“This was one twenty-four-hour period. The things that are doing this

are rattling all the windows looking for the way to make us die, and I don't know how we guard our physical fucking constants against attack. It's just a matter of time before they figure out how to trigger vacuum decay or something. So I'm going to keep doing exactly everything I can, and yes, that means sharing data. Because if that's how we catch a break on this, it will be worth it. And if poor Dr. Lee needs to assassinate me because of it, at least it won't be my problem anymore."

"Okay. I get it."

"Trejo's fighting to hold on to an empire. I'm fighting to have something that's recognizable as the universe with living things in it."

"I get it," he said again, but now that she'd started, she couldn't stop. Not until the pressure was vented.

"If there's a chance—one chance in a billion—for me to figure this out, I'm taking it. If there's a price that I have to pay, that's fine. Not even going to think about that. Just opening my wallet, and whatever the universe needs to take from me, it's welcome to. That's what we're playing for. So yes, I really, really hope that Duarte snapped out of his fugue state and ran off to do whatever the fuck half-protomolecule former emperors do in their retirement, because that would mean Trejo wasn't playing court intrigue games with me while I'm at work. But who knows? I don't."

She went quiet, still shaking her head in a tight, angry motion. Fayez steadied himself on the handhold.

"How do I help?"

"Just keep doing what you're doing. Help me keep doing what I'm doing. Hope that we catch a break in time."

"All right," he said. "Can do."

"I'm sorry. I didn't mean to—"

"I do not accept your apology. You're right. I get it."

She took his hand. She felt cold. Her skin was dry. She'd grown thin enough that he could feel the individual tendons shifting over her bones. "I'm so sorry I pulled you into this."

"It's hellish, that's true. But the company's good."

"No one I'd rather face the end of everything with than you."

"It's because I have a cute ass, isn't it? That's my secret power."

She managed a smile. "You got me."

"I can crack a walnut with these cheeks," Fayez said. "I mean, you

wouldn't want to eat it afterward, but—”

“I love you,” she said. “Stop cheering me up. Send Cara back. I need to get some work done.”

He found Cara in her quarters with Xan. They were floating together in the space between their bunks, with Xan chattering excitedly about something from his entertainment feeds. Cara's face was the polite boredom of older siblings throughout history. It was weirdly reassuring to see something normal, given their context. When Fayeze cleared his throat, the pleasure on the girl's face was as clear as the disappointment on her brother's.

“Is Dr. Okoye ready?” Cara asked, and there was a hunger in the question that left Fayeze a little uncomfortable. He swallowed it.

“She is. Sorry I interrupted. Just had some stuff I needed to talk with her about.”

“It's okay,” Cara said. “But I should go.”

Fayeze pulled himself aside and let the girl haul herself out. As she floated down the corridor, he had one of those moments he had sometimes where his sense of balance tried to wake up. For just a moment, Cara wasn't floating away to the side, but falling headfirst down the hallway. He grabbed the handhold to steady himself, and after a few breaths, the feeling passed.

“Is something wrong?” Xan asked.

“No. I just... I'm never going to get used to living on the float. Spent my formative years down a gravity well, and some things are baked in.”

“I've heard that,” Xan said, then turned and touched the ceiling to press himself down toward the floor. It was hard to read his expression. The kid had been a little boy for several decades now, and between his child-stuck brain and the depth of his experience, he wasn't really one thing or the other. His sister was like that too. It was impossible to see them as children, and it was impossible not to. Xan's mag boots locked onto the deck, and he turned almost like he was walking in gravity.

“What about you?” Fayeze said. “All well in your world?”

“I'm worried about Cara,” he said without hesitating. “She keeps coming back different.”

“Yeah? Different how?”

“Changed,” Xan said. “The thing that's teaching her? It's making her

too.”

The chill that ran through Fayeze had nothing to do with temperature. He kept his tone light and jovial. “What’s it making her into, do you think?”

Xan shook his head. An *I don’t know* motion. “We’ll find out,” he said.

Chapter Eleven: Teresa

At fifteen years since the first permanent settlements, New Egypt was a younger colony system. It had two planets with large habitable areas. The school where she was going to live, like most of the other established settlements, was on the smaller of them, the fourth planet out from the sun. The planet—called Abbassia—had a little under three-quarters g and a thirty-hour day. For reasons that hadn't been investigated in depth yet, the magnetosphere was very strong, which was important given the very active and frequent solar flares. Even near the equator, the auroras were supposed to be magnificent.

The total population of the two planets together was less than the Laconian capital, and it was spread across half a dozen small cities and a score of mineral extraction sites. Only a third of Abbassia was covered by ocean, and most of the land surface was arid, though with extensive cloud forest analogs at upper elevations in both the northern and southern hemispheres.

Sohag Presbyterian Academy was nestled in a river valley in the south, a few hundred kilometers from Nouvelle École, with which it cooperated academically. Sohag Presbyterian's grounds were a little under a thousand hectares of terraformed soil and agricultural cultivates. The buildings had been designed by Alvaro Pió shortly before his death, and they were listed in the top thousand most significant architectural sites in the new worlds.

Teresa had looked at pictures of the campus filled with smiling young people her age and a little older. She tried to imagine herself among them. Tried to imagine who she would be if she were in those images. *This is going to be my home now. Unless something goes wrong.*

And it seemed like something might be going wrong.

The whole crew was gathered at a screen on the ops deck that showed the tactical display of the New Egypt system. Their focus—and so Teresa's

focus too—was the ship that had just passed through the ring gate 6 AU behind them and was burning hard for Abbassia.

“I don’t have it on any of the transit schedules from the underground,” Naomi said. “But that’s exactly the problem. There isn’t a single coordinated set of flight plans, and even if there were, people are smuggling all the time now.”

“Nothing on the drive signature?” Jim asked.

“Doesn’t match anything in the records,” Alex said. “But that doesn’t mean much either. Could be something that was built or had the drive swapped out at a shipyard in Bara Gaon or Auberon. There’s more and more decent yards in other systems too. It’s not like it was back when everything was just Sol system.”

“I know,” Jim said.

Alex increased the size of the image, but the ship was still too small to make out—a black dot against the brightness of its drive plume. A few dozen meters of ceramic and carbon-silicate lace as seen from almost nine hundred million kilometers. It was a miracle they could make out as much as they could. “Chances are decent that its coming through now is just coincidence.”

“Yeah,” Jim said in a voice that meant he disagreed. Amos crossed his thick arms over his chest and smiled. He wasn’t smiling about anything. Teresa still thought of him as Timothy sometimes. Timothy always smiled, even when he’d been hiding in a cave. Jim hauled in a wide sigh and let it out again. “But if it is a Laconian ship—”

“It still probably wouldn’t be tracking us,” Naomi said. “We’ve kept radio silence. We’re not even passing data with the local repeater network. They’d have to know we were coming here.”

“Probably it’s what it looks like,” Amos said. “Freighter hauling freight. Or a pirate. Pirates are good too.”

“It’s not the chances that bother me,” Jim said. “It’s the stakes. I don’t want them tracking us down to the surface.”

“I can make landfall when the site’s on the far side of the planet,” Alex said. “Zip in, drop Teresa and the pup off, and get back up above atmosphere before they’d see us taking off. Even if they’re watching, they won’t know where we went. Might not even know we landed at all.”

Teresa listened with a sensation growing in her belly. It was like a

tightness. Or a stone. It had a taste too. She unbuckled herself from the crash couch and pulled herself down the lift. She wasn't sure where she was going, but the crew of the *Rocinante* talking through the details of how they were going to drop her off made staying in place unbearable.

She passed by the galley to the crew quarters, including her own. She heard Muskrat bark an inquiry as she passed, but she didn't answer, just kept going down. The machine shop was as close to a safe and comfortable place as she had anymore. She had a list of tasks from Amos and she pulled it up. It was time to check the water supply's chemical sensors. She'd never done it before, but the instructions were linked to the entry. She read them, gathered up the tools, and made her way to the tank feeds. Her jaw ached. She made herself stop clenching her teeth.

Travel between systems was slow. The *Rocinante* didn't have any of the breathable-fluid crash couches that would let bodies sustain long, very high-g burns. The duties that Amos assigned her to keep her engaged filled the gap that Ilich and other tutors had left, and she clung to them now not because she particularly enjoyed them, but because they were familiar. And because it felt like laying claim to something.

She was about halfway done with a bubble of escaped water the size of her fist adhering to her arm when Amos pulled himself in beside her. He didn't say anything, just took a little hand vacuum and cleaned the spilled water off her wrist. He handed her tools when she needed them and stowed them for her when she didn't. It went faster with him there. In the end, she found that two sensors out of sixty were showing periodic faults. Low-voltage shorts. Harmless. And they could be down half the sensors and not really have to worry about water quality. She tagged both of them for replacement anyway. Amos' philosophy was to replace things before you needed to, not after. She found it a sensible rule.

"So," he said, "this was back on Earth when I was younger than you are now. There was this guy I knew. His parents both OD'd the same night. Upside, he was a registered birth, so someone gave a shit. Downside, he got put into the foster system. It fucked him up pretty good."

"Abusive foster caregivers are a common issue in aggressively individualist social orders. I had a unit about civil service reform two years ago. We studied it."

"True, but that wasn't the only thing got him. He was one of those

people that tried to put down roots, you know? Wherever he was, he'd find things and hold on to them. Put him in a new city for a week, and he'd already have a favorite park. That kind of shit. Only it was fostering, so every few months he'd lose it all again."

"Is this an uplifting story about how he found his real home inside himself?"

Amos went still for a moment the way he did, then looked chagrined. "Actually, he got addicted to a bunch of home-brewed narcotics and slow-melted his nervous system. So, nah, not really. I was trying to say that you're not the only one who has a hard time letting go. Moving on to the next thing. I don't know. Thought it might help to hear that."

"What about you?"

"I'm good wherever I am," he said. "But getting to that point was unpleasant. You don't want to be like me."

They were quiet for a moment. Her sleeve was still wet. It clung to her arm.

"I'm angry," she said.

"I know."

"I feel like he's throwing me away. Putting me aside because I'm inconvenient."

"I hear you."

"It's like who I am and what I want don't even matter to him. I know that's crazy. Or at least I know it's overblown, but it's like I have a splinter I can't dig out. It's just right there on my nerve ending, and every time I even brush up against it, it hurts."

"Yeah."

She sat still, feeling her blood pulse in her temple, her mind agitated. "I'm not really mad at the captain, am I? This is about my father."

"This school thing could be good for you, Tiny. A lot healthier than hanging around an old warship with nobody your own age."

"But I *like* it here. You like me being here, right?"

"No," Amos said. "I don't want you to stay."

It felt like a punch in the gut. "But—"

"Look, Tiny, I've watched a lot of people die. Some of them were my friends. I'm mostly okay with that now. But I ain't ready to watch you die. And if you stay here on this ship, you will. That's the kind of ship this is."

“That’s what Jim said too,” Teresa said.

“Yeah? Well, the two of us see a lot of things the same way.”

“You seem very different to me.”

“We are.”

“You’re going to be fighting for the fate of humanity. I’m going to be worrying about algebra assignments.”

“Well, maybe you’ll get lucky and we’ll win and the algebra will matter. Then twenty, thirty years down the road, something else will show up to slaughter everyone, and you can take care of that one.”

She didn’t want to be crying. She didn’t want to be sad. Amos leaned over and put a thick, ropy arm around her. He was strangely hot to the touch, like he was always running a fever. She leaned into him and wept anyway.

She said her goodbyes to Alex and Naomi on the ship just after they touched down. They’d landed far enough away from the school that they wouldn’t damage the grounds, so there was still a little walk from her old life to her new one. She tried not to think about that. It was easier if she could pretend that this wasn’t the last time she would be on the ship. That she didn’t have to start her life over again. She just put one foot in front of the other as if this particular walk didn’t signify anything in particular.

Jim and Amos went with her to make sure everything was all right, but she could tell their minds were more than half on the incoming ship. Like guards from the State Building, they wore light body armor and sidearms. She just had a duffel bag with a couple of folded flight suits and a few days’ supply of dog food. Muskrat trotted along with them, her brown, worried eyes shifting between Teresa and Amos.

The sky was wide and blue with cumulus clouds on the horizon. The valley opened before them, gentle curves of land that looked like erosion and wind and the growth of plants. The local plants were tall and thin, rising up into the air like three-meter-high blades of blue-tinged grass. The

breeze passing among them sounded like radio static. The school's grounds stood out from the world around it—straight lines and right angles. The air smelled like overheated metal.

There weren't any people.

"Term doesn't start for another two weeks," Jim said. "You're probably the first to arrive."

"Isn't it a boarding school?" Teresa asked.

"They still have breaks between terms. I mean, don't they?"

Amos shrugged. "Not a lot of private school types in my social circles. They know we're coming?"

"Finley knows to expect us, but Naomi was keeping the radio-silence thing pretty strict. You know, in case."

"Sure," Amos said.

The main path was crushed stone gravel, light gray with flashes of pink and blue and gold where the sunlight glittered off it. An earthmover stood idle at the side of the path. Its wide industrial treads had left tracks behind it half a meter across. The disturbed ground was dark and damp. The sun hadn't dried it yet. Amos smiled at nothing in particular, looking around like a tourist taking in the sights. Jim seemed tenser.

They walked up the path to a central courtyard three glass-windowed stories tall with a canopy stretched between the buildings. A stone fountain had lines of mineral deposits that showed where the water would have flowed if it had been flowing.

Teresa recognized it all from her reading about the school—the pale wood juxtaposed with the glass was apparently very interesting from an architectural perspective, but she just thought it looked awkward. The smiling kids and serious instructors that had filled the campus weren't there, though. Muskrat whined and pressed in against Teresa's leg.

"Yeah, dog," Amos said. "Putting my little hairs up too."

The wide double doors of the main building ten meters ahead of them swung open and a woman stepped out. Her arms were out at her sides, her hands open and empty. She was tall, long limbed, and thin, with high cheekbones and dark eyes. Her skin looked as taut and tough as if she'd been carved out of wood. Teresa couldn't guess the woman's age, but she wore a Laconian Marine uniform.

Jim muttered *fuck* to himself.

“I’m unarmed,” the woman said. Teresa recognized her tone. An officer’s voice. Brusque, and carrying an expectation of obedience. Her father’s palace had been filled with voices like it. “I’m no threat to you. You don’t need to escalate.”

“What are you doing here?” Teresa said, loud enough to carry through the courtyard. “Do you know who I am?”

Amos put a hand on her shoulder and gently pulled her half a step back. Jim’s eyes were wide, and his face was bloodless. If his expression hadn’t been so calm, she would have thought he was having a panic attack.

“Yes, I know who you are,” the woman said. “You’re Teresa Duarte. I am Colonel Aliana Tanaka of the Laconian Marine Corps. And Captain Holden, if I’m not mistaken. I have to say that’s a bit of a surprise. I’d have thought you’d have put her on a different ship. Eggs. Baskets. You know.”

Jim stood silent. Frozen. *Oh*, Teresa thought. *He’s about to have a panic attack.*

“I’m not here to hurt anyone,” Tanaka said. “I need the girl’s help.”

“I am here of my own free will,” Teresa said. “If my father—”

“At this point, I am considerably better briefed about your father’s condition than you are,” Tanaka said.

Amos reached down into his pocket, appearing to scratch idly at his leg while he looked up toward the canopy. Teresa heard a tiny, distant voice. Alex, saying *What’s up, big guy?*

“If we’re all friends and just talking,” Amos said, his voice loud enough to carry, “how come you got a fire team on the roof up there?”

Teresa looked up. She wasn’t certain, but there might have been shadows on the canopy. Her heart was tapping at her ribs like it wanted to get out. Muskrat whined, and she put a hand on the old dog’s back.

“He’s right,” Jim said, his voice steadier than Teresa expected. “That doesn’t seem friendly.”

The woman didn’t miss a beat. “You’re correct. If I wanted to resolve this through violence, it would already be resolved. But I think we’ve all been through enough firefights to understand that when the bullets start flying, it gets very hard to be certain where they all end up. And I don’t want anything to happen to the girl either.”

“Where’s the head of school?” Jim said. “The one who was meeting us?”

“She’s safe. Honestly, I was hoping I’d find Teresa already here.”

“We didn’t know we were inconveniencing you, or we’d have scheduled things differently,” Jim said. Despite the casualness of his words, his voice was like a wire under so much tension it was about to snap.

“In your position, I would have made getting her to safety a much higher priority. You can’t imagine what a relief it is to discover I didn’t waste my time coming out.”

“You sure about that?” Jim said.

“Wouldn’t play with this one, Cap,” Amos said softly. There was a dangerous buzz in his voice Teresa had only heard once before. *Close your eyes, Tiny. You don’t want to watch this.* The last thing he’d said to her before he’d been killed.

“This isn’t a fight either of us need to have,” Tanaka said, taking a few slow steps forward. Her arms were still out to her sides, fingers splayed to emphasize the emptiness of her hands. “I’m not looking to arrest you, Captain Holden. Or your crew. Or your ship. You’re free to go. My mandate at present is very narrow.”

Teresa glanced over at Jim, and he looked back. While their gazes were still locked, he shouted, “How do I know you won’t open fire as soon as we don’t have her?”

There was no reason for her to believe that Jim was bluffing. In the moment, Teresa was certain he would leave her with Tanaka, and relief complicated her fear. They didn’t want to see her die. She understood that better now. She didn’t want to see them die either.

“You have my word,” Tanaka said.

“I was looking for something a little more solid.”

“I don’t have a habit of breaking faith. That’s going to have to be enough.”

Jim looked away from Teresa, back to the woman. Amos had started humming softly and tunelessly. The shadows on the canopy were larger now, and more clearly shaped like Laconian power armor.

“Not sure that it is going to be enough,” Jim said, “but I’m willing to discuss other ways to make a handoff. You let us go back to our ship. Once we’re in the airlock, we’ll let the girl walk back by herself.”

Tanaka’s smile was hard. “Let me make a counteroffer. How about you do what I said, and no one dies?”

Jim tensed. He was on the edge of doing something stupid out of fear, and Tanaka was starting to escalate. Teresa had been trained in negotiation strategies, up to and including hostage situations. Jim was going to fuck this up. She had to take control. “I’m a little tired of being talked about like I was luggage. This isn’t a conversation between him and you. This is a conversation with me. I decide what ship I leave this place on. Not him.”

Muskrat, sensing the tension, started barking and hopping on her front legs. Tanaka smiled, and it was cold.

“All right,” Tanaka said. “Please come with me. Do it now, and in return I won’t kill your friends.”

“You don’t have to do this,” Jim said, quietly enough that it was just for her to hear it.

Whatever happened, she would know that even now, having landed on this planet to get rid of her, he was still willing to die to protect her. The knot in her stomach was replaced by something warm and comforting. It had to be enough.

“I’ll go,” Teresa said, but no one heard her. Her voice was suddenly drowned out as the static hiss of the tree-sized grasses took on a deafening rumble. For a second, she thought of earthquakes or stampedes of cattle. Tanaka’s neck worked. She was subvocalizing to someone.

“You have to the count of three,” Tanaka shouted. “One—”

Amos said *Fuck it*, stepped in front of Teresa, and drew his gun.

Chapter Twelve: Tanaka

The girl was staring at her, arms crossed defiantly, so certain of her place in the natural order. Comfortable with the absolute necessity of her existence. Tanaka had seen that attitude before in other people, many times. She'd also seen the surprise and hurt in their eyes as they died.

Tanaka had no such illusions.

Anyone could die at any time, and the universe didn't give a shit. So while the girl stood in front of her shielded by nothing but the accident of having a powerful daddy, Tanaka wore an armored suit of woven carbon-silicate lace that would stop anything short of a rocket launcher under her clothes.

"I'm a little tired of being talked about like I was luggage. This isn't a conversation between him and you. This is a conversation with me. I decide what ship I leave this place on. Not him."

Oh, little girl, Tanaka thought, *you have no idea.* It made her hands itch to have Duarte's daughter so close and not just grab her. A dozen quick steps and she'd have the girl, the escaped prisoner, and the terrorist who was apparently not dead despite having been shot in the head back on Laconia. But killing the kid had a lot of downside, and the risk wasn't zero. So instead, she smiled and spread her hands a little wider, trying to seem as nonthreatening as possible. James Holden might be rounding the corner from middle-aged into old, but he was still dangerous. And the lump of gristle next to him that went by Amos Burton had more than one question mark next to him in her book. Tanaka didn't underestimate either of them. The dog started barking and bouncing up and down on its front paws. It wasn't a trained attack animal, just an old pet. She knew from the file that the girl would be easier to control if they didn't kill it.

We're all friends here, she smiled at them, willing it to be true. A large-caliber pistol loaded with high explosive rounds pressed into the small of

her back in case it turned out they weren't.

"Venom One," a voice said in her ear. "Check check."

"Venom Two at southwest corner, I've got Holden," came a different voice.

"Venom Four northeast, I've got Bluto," said a third.

"Three covering south."

Tanaka smiled. Whatever happened from here in, her enemy was well and truly fucked.

"All right," Tanaka said to Teresa, playing for time. "Please come with me. Do it now, and in return I won't kill your friends."

The girl looked uncertain. She'd never believe a threat made to her. Not really. But threats to her friends she believed. Her file made it clear she had significant abandonment issues. If things like that didn't make you strong, they made you weak.

"You hearing this?" Venom One asked, his mic buzzing with background noise as he spoke.

A distant rumble was growing, the tall swordlike foliage whipping as something blasted toward them. The girl was talking, but whatever she was saying was drowned out by the noise.

"*Sparrowhawk*," Tanaka said, activating the bone mic in her jaw.

"Mugabo here."

"*Rocinante* is oscar mike," she said.

"On our way," Mugabo replied. He'd hidden her ship around the far side of the planet to avoid detection. She'd known that was a risk. She didn't regret it. Not yet, at least. "I'll be to you in twenty."

Tanaka's gaze flickered across what was about to be a battlefield. She probably couldn't stall for twenty.

"Forget me," she said to Mugabo. "Stay on the *Rocinante*. Do not let it leave this planet with the girl on board."

"Are you... authorizing force? Even if the girl is on board?"

Tanaka didn't answer. She needed to get her hands on the target before the *Rocinante* showed up. She couldn't risk losing the girl if the situation went violent. And when her team moved on the two adults and the *Sparrowhawk* showed up overhead, things were liable to go very violent indeed.

Out of time and out of options. Something like pleasure flowed through

her. It was time for someone to make a decision.

“You have to the count of three,” Tanaka shouted at the girl as she beckoned. *Come to me.* “One—”

Burton shoved the girl behind him and pulled his gun. The *Rocinante* blasted into view, barely skimming the tops of the foliage, the powerful landing thrusters in her belly flattening everything it passed over. Tanaka found herself impressed by the recklessness of the maneuver. Here she was, working so hard not to put the girl in any danger, and the *Rocinante* crew was willing to throw a spaceship at her to keep her away.

“Venom, take the girl,” she shouted over the deafening sound of the ship, pulling her gun from behind her back in a smooth, practiced motion. Burton saw her do it and drew down on her as he continued pushing the girl back toward the approaching ship. Tanaka dove behind a low stone planter box just as he fired, the bullet blowing a fountain of soil into the air.

“Shots fired,” one of her team said.

“Five millimeter caseless. Low threat,” someone else said, as flat and emotionless as if he were placing a lunch order.

“They’re firing at *me*,” Tanaka shouted back. “Get the girl!”

“Free fire?” Venom One, the team leader, asked.

“No, no shooting. Pull the other two apart with your hands if you need to, but do not risk firing toward the girl,” Tanaka yelled, then peeked up over the planter box. Holden, Burton, and the girl were about thirty meters away now, still backing up. The *Rocinante* had taken up position about two hundred and fifty meters farther away, still hovering on its landing jets. It would have to put down to let them board, but the pilot wasn’t taking any chances.

A metallic-blue figure dropped into the courtyard between Tanaka and Holden, then darted toward the fleeing group in a blur. Three more figures dropped from the canopy above, surrounding Holden and the girl. Burton pointed his gun at one and started firing.

“Taking fire,” Venom Two reported.

Her team moved toward the three, not returning fire but moving fast. Aggressively. The old-style Martian Navy sidearms Holden and Burton carried would never penetrate a modern suit of Laconian power armor. They could fire their guns dry, and her team would just walk up and snap their necks. Quick, neat, almost no danger to the girl unless Burton shot her.

But the old mechanic was careful and methodical as he fired. Every shot hit one of Tanaka's team, and he kept the girl behind him.

Venom Three was the closest, only a few meters from Holden, when the world exploded. A blinding flash, and a concussion like someone had hit her in the chest. Tanaka dove back behind her planter box, her mind trying to make the detonation into her team having disobeyed orders and opened fire. But the guns on the Laconian armor weren't that loud. Nothing was that loud.

A quick look over the planter box told her that all four members of her fire team were down. No, not down. Literally blown apart. She could see the remains of Venom Two, an undifferentiated pile of meat and technology spread across a few meters of ground. In the distance, the barrels of the *Rocinante's* point-defense cannons were fully extended, and swiveling as they looked for new targets.

PDC fire in atmosphere with their own people between the ship and its target. If she'd had time to think about it, she'd have been impressed by the audacity.

Tanaka jumped up to her feet and ran flat out toward one of the school buildings surrounding the courtyard, looking for cover. She imagined one of those PDC barrels snapping around with merciless machine speed to lock onto her. If it fired, she'd never hear the shots that ended her. Against a warship's PDC rounds, her fancy armored undersuit might as well be silk pajamas.

She made it to the wall of the school building. The *Rocinante*, hovering on its maneuvering thrusters, was completely blocked from her line of sight. She didn't think a pilot who flew for James Holden would shoot through a school to get her, but she displaced to another nearby building anyway. Once the shooting had started, people could panic and do things they would never have imagined themselves doing otherwise. Better not to risk it.

The roar of the ship's thrusters rose in pitch, then began to cycle down. The ship had landed. They'd blown her team apart, sent her running, and decided the coast was clear.

The coast is decidedly not clear, motherfuckers.

Tanaka sprinted out from behind the building and into the tall native grass. She ran parallel to the path Holden and crew were taking toward their ship, staying far enough away to hopefully hide the sound of her movement.

If anyone could still hear anything after the ear-shattering blast of the *Rocinante's* PDCs firing in atmosphere. Even if they caught something on thermals, they might think twice about accidentally shooting a bystander. Might. They were a pretty fucking reckless bunch. She was going to enjoy taking them down.

After thirty meters she slowed down and angled in toward the three fleeing shapes. She was still a dozen meters away from them when she caught a glimpse of Holden in his dark Martian armor heading toward the ship. He wasn't looking in her direction. Through the ringing in her ears, she was almost certain she could hear the dog barking, so the girl had to be nearby.

Tanaka angled away and put on more speed, staying low but getting ahead of them. The surface of the tall native grass was covered in tiny hooks that tugged at her clothes when she brushed against them. When she accidentally hit one with the back of her hand, it left a painful abrasion, like a rug burn. She ignored it. She had the scent of blood, and her prey was just a few meters away.

When Tanaka felt she'd gotten far enough ahead of them, she moved back to the edge of the grass and waited. The ship had gone quiet. The grass hummed its white noise around her. From farther down the path, the dog was barking. She heard Holden's voice. *Hurry. They'll have backup coming.* They were a dozen meters or so away and moving toward her. They were trotting, but she'd been faster. One step ahead.

Tanaka stepped out of the grass, leveling her pistol at Holden. The look of surprise on his face would have been comical in any other context. The girl shrieked with alarm and grabbed at her dog's collar as it barked furiously.

"I can't let you leave with that girl."

Holden had his gun in his hand, but it was down at his side. He shifted his weight like he was going to make a move, but Tanaka just shook her head at him and pointed her gun at his face.

"If I spray you all over that girl, she'll panic. If she runs, things get even less predictable than this. No one wants that."

Holden nodded and dropped the pistol, then his gaze shifted to Tanaka's left shoulder.

"Wait," she said, "where's—"

“Right here,” said a deep voice from behind her.

Shit. She was one step behind.

She was already swiveling to bring her gun to bear before the second word was out. Something heavy slammed into the side of her head and sent her spinning to the ground. Amos Burton stepped out of the grass, his hands balled up into fists.

“Hi,” he said, moving toward her.

The hit was solid, jaw to inner ear. Her world was swimming. Tanaka rolled away and found her gun on the ground. She was bringing it up when Burton’s boot connected with her forearm and sent the pistol flying off into the grass.

“What are you doing?” Holden asked.

I’m getting my ass kicked, Tanaka thought, dazed enough to wonder why he was speaking to her.

“I think we might want to talk to this one,” Burton said. “Let’s take her with us.”

Tanaka said, “No,” and tried to stand, then let herself collapse again. *Look how hurt I am.* It was only half bullshit.

“Hurry up,” Holden said, and started to lead the girl past her.

Burton reached down to grab Tanaka’s arm and yank her to her feet. He was very strong. That was good. It would make him overconfident. Tanaka let him pull her up, pushing hard with her legs as she rose, and snapping her other arm up to drive her palm into the underside of the big man’s chin. His head jerked back from the impact, but his grip on her left bicep didn’t loosen.

He raised his other arm and threw a massive fist at her face. With his hand gripping her, she couldn’t dodge, so she whipped her head to the right and slapped at the punch, shoving it to the left. It still grazed her cheek, and the impact was enough to make that side of her face go numb.

The motion brought him in closer, and Tanaka threw herself backward, letting the momentum of the punch and her own weight yank Burton off his feet and on top of her as she fell.

He let go of her arm, trying by reflex to catch himself, and they both hit the ground. He landed on her like a falling tree, driving the air from her lungs. She was ready for it, though, and threw up an elbow that caught Burton in the throat as he dropped. He made a sound like an injured duck

and rolled away, clutching at his neck. Tanaka bounced to her feet and looked for the girl. The swimming world whirled around her. She gritted her teeth and ignored it.

The girl was hiding behind Holden, clutching at her dog and staring at the melee, her mouth a round O of surprise. He was digging around at his feet, trying to pick up his dropped gun.

Tanaka could see hers, lying in the grass not too far away. Diving for it to take a rushed shot at Holden would be risky with the girl so close by. She raised a hand instead. "Holden, wait."

"Leave him out of it," Burton said behind her, "we're not done yet."

Tanaka spun on the ball of her foot and lashed out with a kick at the spot the sound was coming from. The big mechanic casually swatted it away. He looked none the worse for wear after a throat strike that would've killed most people. Something was wrong with his eyes. They were flat black. She remembered reading about someone with eyes like that. She didn't remember who.

"I've read your file," Tanaka said, backing toward Holden and the girl. She didn't have time for a boxing match with the strange-looking man with the eerie black eyes. Not when her best shots didn't seem to even faze him.

"Yeah?" he asked, moving toward her.

"It said we killed you," she said. "Any other time, I'd stay to figure that out." The girl was so close that, if she could just get her balance, she could take two steps, grab her, and be running before the others knew what had happened. Tanaka would place bets they wouldn't shoot at her if she had the kid in her arms.

"You've got time," Burton said.

Tanaka turned toward the girl and then stopped short. Holden was standing in front of her, his gun in his hand. The eyes that had seemed frightened a moment ago were now flat, emotionless, cold. *That's bad.*

"No," he said. "She doesn't."

Before Tanaka could even start to move, Holden's gun went off three times. She felt the three shots as hammer blows to her sternum. All three, center mass. Kill shots. She hadn't been certain until that moment that he had it in him.

Tanaka staggered two steps toward the edge of the path and then collapsed on her face. The three slugs from Holden's gun pressed into her

chest where the nanofiber undershirt had caught them, like daggers in the deep-tissue bruise they'd left in her flesh. She ignored the pain and lay very still, holding her breath.

"Shit, Cap," Burton was saying. "I think we shoulda kept her."

"We have to go. We have to get out of here. Now," Holden replied. He sounded angry. Based on her reading of his file, Tanaka would have bet he wasn't mad at the mechanic. He was angry he'd been forced to shoot someone. For all the shit he'd seen, the Laconian interrogator's psych evaluation said that Holden had never really grown comfortable with violence.

Don't come check my body, Tanaka willed at them.

"Let's get out of here before more of them show up," Holden said, and the three of them started walking away.

Moving as little as possible, Tanaka inched toward her gun. When she was able to put her right hand on it, she risked turning her head to see where they were. Holden and Burton were side by side, the girl between them. They were about forty meters away. Not a very long shot. Not for her. They were both wearing old Martian light body armor. The high explosive rounds in her pistol would go right through it. There was some risk of fragmentation hitting the girl, but it wasn't likely to be fatal. And fuck it. A little bruising might do the bitch some good.

Tanaka rolled onto her back and sat up. She aimed at Burton's back. He was the more dangerous of the two. Kill him first. She lined up her sights between the big man's shoulder blades. Took a long breath, let half of it out, and pulled the trigger.

The round slammed into his back and blew out his chest like someone had swapped his heart with a grenade. Tanaka shifted her aim to Holden, who was already spinning, gun in hand. The big man took a couple more steps and fell over. She lined up on Holden's chest, then jerked her head as something cut a groove across her scalp. The report of the gunshot arrived a split second later.

He figured out the body armor, Tanaka thought. *He's taking the headshot.*

She moved, scrambling for cover in the grass and trying to line up her next shot. Holden was standing still, pivoting slowly at the waist to put his sights on her. It was a race now, and she was sighted in on his head, ready

to pull the trigger and end it, when someone slammed a sledgehammer into her cheek. The other side of her mouth exploded out. The pain barely lasted long enough to notice, and everything was gone.

Interlude: The Dreamer

The dreamer dreams, and her dream carries her deeper into intimacy with vastness. All through the wideness and flow, she sparkles and the sparkles become thought where there was no thought before. The great slowness remains, soft and wide as the icy cold and all-encompassing sea, and the slowness (drifting, languid) shuffles and reshuffles itself. The sticky and the slippery, the bright and the dark, the moving and the moving for there is no true stillness in the spark-filled substrate, and the sparks become a mind. The dreamer dreams, and others dream with her, not just the ones at her side, not just the bubbles of salt, but the dance that they make. She dreams the dance, and the dance dreams her back. Hello hello hello.

Once, and gone so far away there were only the first thoughts to think it, the *it* was like this: the ball at the center of down, and the shell at the edge of up, and between them the slow dancers and the sudden dance. *Watch watch watch*, the grandmothers whisper, and their voices become a chorus, and the chorus says something else. The dance wants, and it pushes to the edges of everything, the skin of the universe. The dreamer dreams the dance and the dance dreams and its dreams become things and the things change the dreams. Desire and longing for desire bumble over eager forward and make new things to dance with. A brain growing the wires that form itself, thoughts flow from one substrate into another, and the great curiosity spins and makes and spins and learns. It presses down into the heat at the bottom of everything. It presses up into the cold, and it cracks the vault of heaven. The cold and hard of up yields to the dance, and the lights that they are meet lights that they are not.

A new thing has happened. Light from *elsewhere*. The bright-singing voice of God, inviting and inviting and inviting—

The kick from behind blows through, carrying blood and bone and breath with it. The dreamer takes a step, and then another, and then falls,

shrieking, and the grandmothers say *no not that, over here over here, look at what came next*. Death floods toward her emptier than darkness and the dreamer forgets, grabs for the brother who is always at her side except not here except not here and the other one is, pock-voiced and funereal, *it's all right it isn't you I've got you*.

She floats up faster than bubbles, the heat below and behind, the cold cracked open to the stars, and screaming, she launches up and out of the dream and into the body that is only hers, in a confusion of vomit and weep and a fading deeper than dreams could be.

What the fuck was that?

Chapter Thirteen: Jim

Amos was limp, his dark eyes closed. His mouth hung open and his lips were white. The hole in his back was about as big as a thumb. The one coming out his chest was wider than two fists together. The black meat of his flesh made the pale bone of his spine look like a worm someone had pulled apart.

“We have to go,” Teresa said from very far away. She pulled at his sleeve. “Jim! We have to *go*.”

He turned to look at her—her impatient scowl, her hair pulled back over her ears. Muskrat, at her side, was dancing on anxious paws and whining. Or maybe that was him. He tried to say *All right* but realized he was about to vomit just in time to turn away.

We have to go, he thought. *Come on. Pull it together.*

He went to Amos, putting his arms under the big man’s knees and across his wide shoulders. On Earth, he’d never have been able to lift him. With the three-quarter g of Abbassia, he was heavy but manageable. Man, girl, dog, and corpse, they started running toward the *Rocinante*. Jim tried to yell *Hurry*, but the thing that had clenched up in his chest when he saw Amos blown apart wouldn’t let him. He didn’t look back. His peripheral vision started to narrow, like they were running down a tunnel that was slowly squeezing closed. He had to get to the ship. A wash of cold and wet stuck his clothes to his belly and his thighs. Amos’ black blood spilling down him.

Ahead of them, the airlock opened. Alex was in it, a rifle in one hand, waving them forward. The dog reached the lock first, misjudging the gravity and skittering against the hull. Teresa grabbed Muskrat around the middle and climbed the ladder with her. The weight of Amos’ body slowed Jim down, but Alex reached out to help with the last couple steps. Jim knelt, lowering the corpse to the deck. The eyelids had opened a slit during the

run, and the eyes beneath focused on nothing. Jim closed them.

“Fuck,” Alex said. “What the fuck?”

“Take off now.”

“All right,” Alex said. “Let’s get stowed, and we’ll—”

Jim shook his head and opened a connection to Naomi. “We’re in. Get us up.”

“Are you in a couch?”

“No, so don’t bounce us around too much, but get us out of here.” She didn’t argue. The roar of the maneuvering thrusters rattled his teeth. He took Teresa by the shoulder, pulling her close to shout in her ear. “Get the dog to her couch and strap yourself in. I don’t know how bad this is going to get.”

She looked at him with an equanimity he couldn’t feel. She was hurt, frightened, traumatized. She was a kid. How could she stand to see what she’d seen? How could he?

“He isn’t secured,” she said.

“He won’t care. Go.”

The deck lurched under them, shifting slowly as the ship went from belly-down to the usual engine-down orientation. Muskrat whined, and Teresa took her by the collar, leading her away. Amos’ body shifted and rolled. There was horror in Alex’s eyes, and Jim felt a rush of anger. The distress in his old friend’s eyes was too much. If he tried to comfort Alex, it would be too much. He was shaking as it was, and he didn’t know if it was the vibration of the ship carving its way through the atmosphere, or his own body betraying him. Maybe both.

“We have to get to ops,” Jim shouted. Alex took a step toward the spent clay that had been Amos, then caught himself, and they made their rocking, unsteady way toward the central lift. The deck shook and plunged under them as they went from handhold to handhold. Thrust gravity and the pull of the planet made his knees and spine ache. His vision, dark. He found himself on the edge of confusion, unsure for a moment whether they were fleeing New Egypt or Laconia. When they reached the lift, he sat down to keep from passing out. His mind pieced itself together as they rose.

Alex squatted beside him. “You okay?”

“They were there waiting for us. They knew we were coming.”

“I’m sorry,” Alex said. “I should have been there.”

“She shot Amos in the back. Shot him in the back as we ran.”

Alex was quiet, because there wasn’t anything to say. Jim looked at his flight suit, smeared black from the gut to the knees. His hands were stained black too, but it still smelled like blood.

The lift pushed up, deck by deck. When they got to ops, Jim either had himself back together or he was fully dissociated. It was hard to know which.

The ride smoothed out as they reached the upper atmosphere. The winds were screaming past them, but with so little mass to the air that a ripping five-hundred-kilometer-per-hour current deflected them less than a breeze. The deck felt steadier under his feet. Naomi was in a couch, the flight controls on her screen. She glanced over as he lowered himself into the crash couch beside hers. He saw her register the blood and whose it was.

“Amos?” she asked.

He shook his head, not meaning that it wasn’t. Meaning not now. He knew she understood.

Alex went up to the flight deck, his rifle still bouncing against his shoulder. “I’m taking the stick,” he shouted down moments later.

“Copy that,” Naomi replied. “I’m fire control.” The screen before her shifted to status readouts on the ship’s guns—PDCs, torpedoes, the keel-mounted rail gun. Jim pulled up tactical. On this screen an augmented map of Abbassia below them filled one side, a schematic of the nearby space of New Egypt system the other. And a sliver of red marked something the *Roci*’s threat detection thought he should be alarmed about. A stone in his chest, he selected it and pulled up the ship identification.

“We’ve got company,” Alex shouted from above.

“I’ve got them,” Jim answered.

Naomi’s voice was sharp and matter-of-fact the way it always was in the teeth of crisis. “Is it a *Storm*?”

Jim looked at the analysis. Now that there was only one *Magnetar*-class ship left, stuck in Laconia guarding their homeworld, the *Storm*-class destroyers were the backbone of Laconian power. And even one would be more than a match for the *Roci*. But this was smaller, with a squat, broad design, and a drive cone that promised it was built for speed.

“No,” he said. “Smaller. Maybe an explorer. I don’t know.”

“Well, it’s coming our way,” Alex said. “And it looks pissed.”

“Can we keep the planet between us and them?”

“If I put us in a low, fast orbit, maybe for a little while. Long term? No.”

“Give me a little while, then.”

Naomi didn't speak, but she cycled through the PDC status checks. If it was a shooting war, they'd be as ready as a lone ship could be. Jim's first impulse was to turn their back to the sun and burn as hard as they could stand it toward the ring gate and out of the system.

It wouldn't work. The Laconian ship was made to be faster. And if they wanted Teresa, their best move was to punch a hole in the *Roci's* drive cone and force a shutdown, then board and take her at their leisure. Turning tail and running would just make the shot easier. The alternative was to make it hard.

He closed his eyes. There was only one next step that he could think of, and he hated it. His mind shifted and slipped, looking for a better idea.

“Uh, Jim?” Alex said. “Your while's about up. What's the play?”

Fuck, he thought. “Keep our nose pointed at them. Make it so they have to put a hole through every deck in the ship to hit the drive.”

Naomi and Alex were silent for a moment, then Alex said, “I'm on it.”

The distant sound of the thrusters was totally different from the earlier roar. The shift of the crash couch felt almost gentle.

Naomi nodded, and checked power status on the rail gun. “Funny. You were saying before that the human shield thing made you uncomfortable.”

“I've moved past uncomfortable to furious.”

She nodded her agreement, then the screen lit up as the tightbeam request was accepted. A man's face appeared on the screen: broad, with round cheeks, dark skin, and a full and well-groomed mustache. He was wearing the blue uniform of Laconia with a captain's rank. He nodded at the camera, as calm as if they were in line together at the commissary.

“Captain Holden. I am Captain Noel Mugabo of the *Sparrowhawk*. Please return to the planet surface. I mean you and your crew no harm.”

“You people just put a bullet through my mechanic,” Jim said, and Naomi stiffened.

“And you killed four Laconian Marines,” the captain said. “I am here to help us both deescalate. My orders are to keep you here. We need Teresa Duarte's assistance, and for that, she must come with us. We will not hurt her, nor will we detain you.”

“I don’t believe you.”

“Your doubt doesn’t change our situation.” Jim noticed the way the man said *our situation*. Building rapport. Making it harder to pull the trigger, but also not backing down a centimeter. He’d had conversations like this as a prisoner on Laconia. “Please return to the planet’s surface, and we will take care of all this without any more violence.”

His crash couch put up a low-grade medical alert. His blood pressure and heart rate were concerning. Not dangerous, but not not-dangerous. He turned off the alerts.

“No,” Jim said. “I think we both know that’s not going to happen.”

Alex called down from the flight deck. “They’re getting closer. Want me to break orbit?”

Jim muted his mic. “Not yet.”

“What alternative do you suggest?” Captain Mugabo asked. “I am open to discussing this.”

“I propose you land so we know you’re not a threat. Then we leave. With the girl.”

“May I have a moment to consult with my superior?”

Jim nodded, and Mugabo’s eyes shifted down as if he were sending a text-only message. Jim pulled up a tactical window. The two ships whipping around the planet in a low orbit, pointed dead-on at each other like gunmen in a cheap entertainment feed. He didn’t know what sorts of weapons the *Sparrowhawk* carried, but he knew for a fact they were all pointed at him right now.

Another window appeared. Fire control, with the rail gun charged and ready, the Laconian ship locked in with passive targeting so that it wouldn’t seem like an escalation. He glanced over to Naomi. She mouthed the words *If you need it*. He nodded.

“All right,” Mugabo said. “I accept your terms.”

“What?”

“We both value the life of the girl. If we have to continue this negotiation another time, so be it. You can go.”

Jim took two long breaths. “You’re not beginning a deorbit burn.”

“Did you expect me to?”

“I don’t think you’re telling me the truth,” Jim said. “I think if I fire the maneuvering thrusters, start to turn a little bit, you’ll send a round through

my drive cone. I think the only reason you haven't already done it is that you'd have to shoot through the whole ship to do it, and the risk to Teresa Duarte is too high."

"I assure you that is not the case," Mugabo said.

"Then you go first. If we're free to leave, begin your descent. When I see you touch down, I'll know you were telling the truth."

"Yes," Mugabo said. "Of course. I very much understand your position."

"You're playing for time."

"I understand why you would feel that way, Captain Holden. Please believe me that we mean you and your crew no harm, and that my offer is sincere."

The tactical screen bloomed at the same moment that Naomi's calm voice reached him. "Fast movers. They've launched torpedoes."

Radar tracked the pair of torpedoes as they arced out away from the *Sparrowhawk*. Mugabo had been buying time while his people locked in a firing solution that sent the torpedoes out and around the *Roci* to arc back in and hit her from behind. Take out the drive and leave the rest of the ship intact.

Jim tapped the fire control, and the *Rocinante* dropped away beneath him for a fraction of a second as a two-kilo tungsten slug spat out toward the enemy without the main drive on to compensate for the kick. Mugabo vanished, the tightbeam connection lost. The rolling, deep chatter of the PDCs vibrated through the ship. One of the torpedoes blinked off his board.

"I'm lining up another shot," Alex said. The rail gun showed ready. The other missile blinked off the board. The *Roci* squealed a warning at them as two more torpedoes locked on.

"They're getting ready to launch again," Jim said.

"I've got the reactor set to dump core if the *Roci* thinks we're out of luck," Naomi said.

"Alex?"

The rail gun locked onto the *Sparrowhawk* a second time and fired without Jim's having to clear it. "I think you got 'em," Alex said.

Jim switched to the external telescopes. The *Sparrowhawk* was where it had been, curving around the planet toward them, its orbit unchanged. But now a cloud of gas and water vapor sprayed out of the ship along one side. The lock-on tone died as the *Sparrowhawk*'s torpedoes failed to fire.

“They may be playing dead,” Naomi said.

“Alex, keep the rail gun trained on them.”

“Copy that.”

A tiny suggestion of up and down came, shifting the couches on their gimbals as Alex adjusted the ship’s orbit to keep the *Sparrowhawk* lined up in their sights. No new lock-on warnings sounded. No active radar bounced off their hull. Jim pulled up the comms again, tried the tightbeam connection without knowing exactly what he’d say if Mugabo answered. He didn’t. The Laconian ship drifted on in its low, fast orbit. Either the Laconian ship would repair itself, or in another few weeks it would fall back down into the planet’s gravity well and burn up like a meteor. Or it was only playing dead, waiting for Jim to declare victory, turn the ship, and catch a rail-gun round through its drive.

“Alex,” he said. “Pull us back on maneuvering thrusters. If they don’t turn to match... Turn us, and let’s break orbit. Get out of here.”

“Copy that,” Alex said, and the *Roci* shifted under Jim. They moved gently. Slowly. Waiting for the alarms that would mean the *Sparrowhawk* had only been playing dead.

The alarms didn’t come.

“So what now?” Alex said.

“Now we plot the fastest way back through the ring gate and out of here.”

“Any thoughts on where to?” Alex asked. “Firdaws is on the flight plan, but—”

“Freehold,” Naomi said, her voice calm and authoritative. “We needed resupply before, and we’re burning through a lot of reaction mass on the maneuvering thrusters. And I wouldn’t mind being under the protection of one of our own while we figure out how this went pear-shaped.”

“Yeah,” Alex said, his voice grim. “This kindness-of-strangers thing isn’t going so well for us.”

Jim heard Naomi’s restraints clattering free, and he felt her coming close. She stroked his hair, and he took her hand, kissing her fingers gently.

“That went very bad,” she said.

“Yeah.”

She waited a moment before she said, “What happened to Amos?”

Jim shook his head. *We lost him*, he tried to say. *I lost him*.

“Yeah,” Amos said. “I got pretty fucked up all right.”

He stepped in from the lift, his shredded flight suit as wet and black as if he’d poured ink on it. The exit wound on his chest was pale flesh around a flat circle of onyx. When he smiled, it seemed tentative.

Naomi’s expression went empty.

“Hey, Cap. We got Tiny back safe, didn’t we?”

It took a moment to understand this was really happening, but then Jim said, “Yeah. We did.”

“And the dog?”

“Her too.”

Amos stepped into the ops deck and lowered himself into an empty crash couch, grunting like he was sore. “Good. Tiny really likes that dog. There’s a hell of a mess in the airlock. I’ll get it cleaned up, but I gotta get some food first. I’m really hungry.”

Alex, drawn by the sound of Amos’ voice, came down from the flight deck. His face was pale. “Amos?”

“Hey,” the big man said, lifting a hand in greeting. “I think I must have took kind of a hit down there. I’m missing some of what happened.”

Jim wanted to feel joy, and he did. But there was something more with it. A sense of wrongness that came from trauma after trauma followed by something that violated his inborn sense of how the universe worked. What was possible.

“You died,” he said. “You took a round to the back, and it blew most of your chest out. I saw your spine. It was in pieces.”

Amos went still in that unnerving way he sometimes did, and then frowned, nodded. “Yeah, okay. I think I knew that part.”

Jim laughed, and it was disbelief. And maybe relief. And something else he couldn’t put a name to. “Is there anything that kills you anymore?”

“Pretty sure I’m starving to death,” Amos said.

“Well,” Alex said. “God damn.”

Naomi still hadn’t spoken. Amos touched the black circle of his wound, exploring it. It didn’t look like skin anymore. Whatever it was, it was what Amos’ resurrected corpse made when it replaced his injured flesh. Jim wondered what the inside of the wound looked like. For the first time it occurred to him that the changes the drones on Laconia had made to his old friend hadn’t stopped when they escaped the planet. Amos hadn’t become

something different. He was in an ongoing process of becoming. Something about the idea was chilling.

As if Amos had read Jim's thoughts, he frowned. "I don't know how this whole thing works. But we'd be better off not doing it too often."

Chapter Fourteen: Elvi

Elvi missed gravity. She wanted to be able to sit by Cara's medical bay and feel the weight of her exhaustion bearing her down. The long, slight stretch along the back of her neck when her head hung forward. The heaviness in her arms and legs. She understood intellectually that she was near collapse, but the familiar somatic cues weren't there on the float. The only one that seemed to remain was the trembling in her large muscles, and by itself that felt like fear.

Cara was strapped into the bay with wide, white bands that kept her from drifting. Her eyes were closed, her mouth relaxed and slightly open. Her lips were pale and bloodless as carved wax, with the tips of white teeth and a dark purple tongue behind them. Her breathing was deep, steady, and slow. Sedatives still worked on her and Xan despite the changes that the repair drones had made to their bodies. The drugs did metabolize faster, but that was fine. Their supplies were ample.

The autodoc was custom built with decades of Cortázar's observations of Cara's and Xan's baselines. The screens were crowded with real-time blood analysis and neural activity profiles as the system tried to match Cara now with Cara where she usually was, and look for ways to bring those two datasets together. A standard bed would have been baffled, but this one showed Cara slowly returning to her standard range of function as Elvi watched and drank tea from a bulb and trembled.

They'd been in the middle of another dive, sifting through the hallucinatory sensations and inhuman memories for pieces to the puzzle of how the gates had been built and if they could be made safe. Elvi was fairly sure they'd reached the part of the alien species' development where they'd become aware of a broader universe beyond the ice shell of their world. She'd expected Cara to get there, and that it would open the door to some of the practical answers they needed. But then Cara had started screaming that

she'd been shot, or if not her, that someone had. The monitors had spiked, and her brain activity lit up like someone had thrown a Molotov cocktail into her mind.

They had restrained the panic, Harshaan Lee barking the steps of the shutdown checklist over Cara's screams and vomiting. By the time they'd shut the dive down, Cara had lost consciousness. She hadn't regained it until now.

Cara's lips moved, and she swallowed. Her eyes shifted under closed lids, and then opened. Black on black, Cara's gaze found her, and the girl tried out a weak smile.

"Hey, Doc."

"Welcome back," Elvi said. "How are you feeling?"

Cara paused, but it wasn't one of the eerie, alien frozen moments. It only seemed like she was trying to find the right answer to a difficult question. "Wrung out. I've never been drunk, but maybe hung over? This feels like what a hangover's supposed to feel like."

"Extrapolating from the literature?" Elvi said, taking Cara's hand. It felt fever-hot.

"Something like that."

"Do you remember what happened? What went wrong?"

"It wasn't the grandmothers, I don't think," Cara said. "They felt the same as always. Deeper, maybe, but the same. It was... one of the others."

"All right. Tell me about that."

Cara frowned and shook her head the way she did when she was searching for some very precise word. "I'm not just myself when I'm in there. I mean, I am, but I'm not just Cara. There's more of me?"

"Like the aliens."

"No, like me watching the aliens. I feel aliens too, but that's like I'm watching a feed. Seeing something that's already recorded. These others are like being everyone in the room who's watching?"

"Like the connection you have with Xan."

"Yes, but more. There are more of them. Only I think something happened. Something bad. I don't know if they died. And then another one of me was trying to calm *me* down." Cara's eyes went wide, and her grip on Elvi's hand squeezed hard enough to hurt. "Xan? Is he all right?"

"Fine," Elvi said, not flinching. "He's worried about you, but that's all."

He was in the isolation chamber when it happened, and it didn't seem to affect him one way or the other."

Cara relaxed. "Okay. Okay. All right, that's good then." She took a breath, settled into herself. "I saw them see stars for the first time."

"We don't have to do a debriefing now. You can rest first."

"Let's talk a little. Please. While it's still fresh in my head."

Elvi felt a little wave of pleasure, then guilt at the pleasure. "Only a little. Then you rest."

Cara settled into herself, remembering the memories of others. There was a joy in her when she did. Or no, that was wrong. Not joy, but a relief. Like Elvi was pouring cool water over a burn.

"They were changing. The sea slugs or jellyfish or whatever? They were taking other bits of life, animals or plants or whatever was down at the hot core of that icy cold world. They sent them down into the vents so that they could change. Or it could change."

"That's been a consistent point. And, judging from how the protomolecule functioned, they kept that strategy for a long, long time," Elvi said.

But Cara wasn't listening. Her voice had a faraway, almost dreamy quality. "The important thing was the light."

"You were saying that. I'm thinking that was the creation of mind."

"A hive mind."

Elvi shrugged. "I've never understood that term, really. I mean, there was an electrochemical structure with a lot of semi-independent bodies. Describe it like that, and we're hive minds of neurons. But did it find a way to build an emergent cognitive analogical system? Yeah. I think so."

"And when they saw the stars, it was like hearing God talking in a language you could almost understand. But not quite. The BFE wanted to show me more. It didn't want me—us, whatever—to go. It was trying to hold on. And then the thing happened, and... If they weren't Xan, I don't know who they were, but they feel right when I'm in there."

Cara let go of Elvi's hand. She focused on something Elvi couldn't see, like she was hearing music that only played for her.

"Don't worry about it," Elvi said. "Not for now. We'll have plenty of time for the full debrief after you've rested. I'm going to let the team know you're all right, and Dr. Sanders wants to come by and make sure you're

solid. Once we hear what he has to say, we'll make some plans for moving forward."

"I don't want to wait. I want to go back in."

Elvi took a sip of her tea. "I want that too. But right now, rest."

Cara nodded and closed her eyes. Elvi waited until she was sure Cara had fallen asleep before she slipped out of the bracing on the foothold and pushed herself toward the door.

Cara spoke at once, her voice perfectly lucid and awake. Not slurred at all. "Can Xan come see me?"

"Of course, if you want."

"He does," Cara said, and lapsed back into silence. Elvi left the medical bay.

All around her the *Falcon* was subdued. The crew that ran the ship and the scientific staff that worked in it all knew what had happened, and their unease made for whispered conversations in the corridors and hallways, tight mouths and hunched shoulders. Elvi made her way to the ops deck, forcing herself to smile and nod and greet people. She hoped she was being a good leader and projecting optimism. She was afraid that she just seemed fake.

Harshaan Lee was in ops, reviewing the dataset from Cara's aborted dive. She moved beside him, looking over his shoulder. He shifted to the side, giving her a better view.

"She says there was someone else in there with her," Elvi said.

"Hallucinogenic presences are very common. It can be induced with a few magnetic impulses to the temporoparietal region of the right lobe."

"Of course, we weren't doing that," Elvi said.

"That doesn't mean something else wasn't."

"Or maybe her right temporoparietal region was firing off because someone was in there with her. Sometimes you see your grandmother because you're dreaming. Sometimes you see her because you're at Grandma's house."

"It is a conundrum," Lee said dryly. Then, "May I touch on a less pleasant subject?"

Elvi didn't say no. Lee took it as consent.

"I don't mean to step out of my place, but I think we're starting to have a morale issue with the crew. I was hoping you'd consider making an

address.”

“What kind of issue?”

He shook his head like he was apologizing for his own words, and he kept his voice low. “We are the only ship in a solar system. Half a dozen tightbeam boosters, couple of repeaters at the ring gate itself, and an alien artifact big enough that if we stood on it, the gravity would crush us. That’s all there is. There isn’t even a dust cloud we could mine for ice.”

“Are we short on supplies?”

“No. But when something... odd happens with the research protocol, there is a kind of multiplier. It reminds us just how tenuous our position is here. If the water recycler broke down in a way we couldn’t fix... It would be a long, hard burn getting someplace that could give us aid before we died of thirst, and we might not make it. If it was the air recycler, we’d die. There is no one who can reroute to our aid. We all understood that when we began the mission. But some days, we understand it more clearly than others, if you see what I mean.”

She reminded herself again that the vibration in her body wasn’t fear. She was just tired, with one critical thing more that she needed to do. “Of course, I’ll address the crew. Just let me think about what to say. And thank you for bringing this to me.”

“Of course, Doctor.”

She hadn’t started in physics. It was possible to spend a whole lifetime in the biological sciences and only have a nodding acquaintance with pure physics. It wasn’t possible to be the head of the Laconian Science Directorate without getting her feet wet, if *wet* meant abstract high-energy physical dynamics. One of the things she’d known without fully appreciating was that the second law of thermodynamics was the only one that cared about the direction of time. The heat death of the universe had mostly been a joke about how long her thesis was taking. The idea that heat was intimately related to time hadn’t seemed strange, and some aspects of

the high weirdness of the alien rings had escaped her.

The man on her wall screen was David Trujillo, and at four hours into his presentation, three and a half of which had been a careful and painstaking walk through a forest of explanations and justifications for which mathematical techniques his team had used in interpreting the data, he was getting to the phase she thought of as *dumbing it down for the biologist*.

“The key is the difference between the reactions provoked by the magnetic field generator in Sol system and the *lack* of provoked response in the ring space itself. We’ve been aware of the energetic amplification effect of ring gate technology. For example, energy sent into the ring station causes a release of high-energy particles through the gates, and the energy of this release is orders of magnitude greater than the initiating event. This asymmetry was exploited in the design of the field generator. The assumption was that this was a borrowing of energy from someplace else within complex local space-time. If, as these results suggest, that’s not accurate, and if the ring gate space is a bounded membrane within an alocal, acontiguous space-time—”

“Is he saying something?” Faye asked from the other side of the cabin. “Because he sounds like he’s just barking.”

Faye was exercising, strapped against the wall by resistance bands and pushing against them the way she should have been. When this was over, her bone density was going to be a problem. That was for another day.

“I’m sorry. I’ll listen on private.”

“No, no. This is me starting a conversation. Getting attention from my sweetheart. Mocking the guy she’s paying attention to by saying how he’s barking.”

“He’s barking about something.”

“Are you sure?”

She stopped the report playback and stretched.

“When the *Tempest* destroyed the defenses on the alien station in the ring space,” Elvi said, “the enemy didn’t respond. When it destroyed Pallas Station, everyone in Sol system lost consciousness, and one of the bullets showed up on the *Tempest*. Trujillo thinks it shows that the ring space isn’t part of our universe.”

Faye relaxed, the bands pulling him back against the wall. He pushed

out again, grunting. “I didn’t know there was an option.”

“The field generator uses antimatter as a primer, but there’s not enough power in a couple handfuls of antimatter to spaghettify a station. The design was developed based on the half-built ship or whatever it was that was in the construction platforms when they were turned on.”

“The one they called the *Proteus*?”

“Basically, it makes a tiny, transitory ring gate, which releases just a lot of energy for free. And apparently, it’s violating entropy. Which means time.”

“Entropy only runs one direction. Primary school physics requires three hours of barking?”

“He’s saying wherever it’s getting that energy from doesn’t play by our rules.”

“We knew that, though.”

“We suspected it.”

“Do we know it now?”

“We suspect it harder,” Elvi said. “We’re scientists. We only know things until someone shows us we’re wrong.”

Fayez chuckled, strained, relaxed. He was waiting for her to laugh with him, but she didn’t have it in her. Worry bloomed on his forehead and the angle of his lips. “Are you all right?”

“There were two more.”

He stopped, looked at her, and shrugged off the straps. “Two more what?”

“Events. Galbraith system saw a transitory change in lightspeed.”

“How long did it last?”

“Literally an unanswerable question, but about an hour. Bara Gaon lost consciousness for eighteen minutes. The people who went through it said there was no halo effect, no visual disturbances, just”—she snapped her fingers—“eighteen minutes later.”

“That’s new.”

“It’s all new. It’s all experiments, and none of them are mine. And those are just the ones we know about. If the poking and prodding wasn’t someplace we know to look for it, it could be happening much more often. It could be happening right here, right now.”

He pushed off through the cabin. She was ready to bristle at his touch,

too tense for the extra burden of physical contact. He only braced beside her and looked at Trujillo's face, paused on the playback.

"How's Cara?" Fayez asked.

"Fine. She seems fine. I'm a little concerned about these others she's talking about. I know she and Xan are connected somehow at the back, and there are other things back there. Amos Burton went through the same thing they did, and if she's connected with him through the same bridge that's... That man's head isn't a place I'd want to live. But..."

He didn't push. He let the silence do it for him. Elvi sighed.

"I'm getting a picture," she said. "I'm starting to understand what built the rings, and how their minds worked. Or mind. Even when I don't understand how their technology works, I'm starting to see the obstacles they were trying to overcome, and that's actually a pretty good starting point. But..."

"But you're wondering how that can be good enough, when the thing they were fighting against killed them and is coming for us."

"There's so much about that I don't understand. What the bullets are."

"Scars where their attempts to break us permanently fuck up part of reality?"

"Sure. Maybe. But how? What does it do? How do they work? Can we use them to get back to wherever these things are? And how come sometimes they black out one system at a time, and then other times, it's everywhere? Why do they blow off locality and then leave a scar or bullet or whatever it is that's in a place and tied to a local frame of reference?"

"And how do you stop them?"

Elvi wiped away a weary tear. "And how do I stop them. Everything's riding on this. Earth, Mars, Laconia, Bara Gaon, Auberon... They all die if I don't solve this."

"If someone doesn't solve this," Fayez said. "We're one ship, and we're on a very promising track. But we're not the only ones looking."

They were silent together, only the hum of the ship around them. She shifted, putting her head against his arm. He curled toward her, kissing her ear. "When was the last time you slept?"

"What's this sleep you speak of? Sounds nice."

He put his arm around her shoulders and drew her gently through the cabin to the sandwich board where she slept when a sack against the wall

wasn't enough. She didn't undress, just slipped between the slabs of gel and let them clamp gently down on her, holding her in place like a giant hand. It was the closest analog to climbing into bed under a pile of blankets, and as soon as he dimmed the lights to a sunset red-gold, she felt sleep rushing up for her like she was falling. Like she was capable of falling.

"You need anything?" he asked, and his voice was soft as a sand dune washed by a breeze. Despite everything, Elvi smiled.

"Stay with me until I fall asleep?"

"My mission in life," Fayez said.

She let her eyes close and her mind wander. She wondered what it would be like to have Fayez in her private mind the way Xan and Cara, and maybe Burton, were in each other's. It had to have some physical element, some center or locus of control that used the same alocal effects that let the gate builders stay connected, neuron analog to neuron analog, through whatever strange dimensions they'd traveled. Maybe if she compared brain morphology, she could find it. Real-time communication between systems would change everything. Assuming anyone was still alive to talk.

She was on the edge of dream, half convinced that the *Falcon* had a university campus in it and that she was preparing to give a lecture, when she roused and chuckled.

"Yes?" Fayez said, still there.

"Lee wants me to give the crew a pep talk. Help shore up morale. I told him I would."

"Any idea what you want to say?"

"No clue," she sighed.

Chapter Fifteen: Teresa

Time was a problem. Time was always a problem.

It started, she had learned, with the fact that simultaneity was an illusion, and “the same time” on different planets in different systems was mostly an accounting convenience that only functioned because most people were moving relatively slowly compared to lightspeed. But beyond that, the measurements of time were embedded in history. An hour had sixty minutes because mathematicians in ancient Babylon had worked in a sexagesimal system. A year was the time it took Earth to make a full transit around Sol, and that mattered even though Teresa had never been to Earth and almost certainly never would. Like the number of minutes in an hour, the width of a centimeter, the volume of a liter, the length of a year was the marker by which humanity told the story of itself.

And so, because an old planet in another system was in more or less the same position relative to its star now as it had been during the siege of Laconia, Teresa Duarte was going to wake up sixteen years old instead of fifteen. And because of how quickly that same planet spun on its axis, it was still early morning, and she was in her quarters on the *Roci*, drifting between wakefulness and dream.

One of the things she’d grown to like about living on the *Rocinante* was the way it made the cycles of daylight and darkness arbitrary. If the crew had decided that every day lasted thirty hours, then it did. If night and day cycled through six hours at a time, then that was true. That they didn’t was a choice, and the fact that it was a choice was strangely wonderful. It would have been easy to become unmoored, and it turned out she liked being unmoored. The ability to drift was delicious. Now, lying on a couch in thrust gravity a fraction of what she’d felt growing up, she was aware of the cool gray walls, the almost-dark lit only by her handheld’s standby light. At the same time, she was also on Laconia, in a secondary machine shop that

opened off her old bedroom and didn't really exist, building something that changed every time she roused a little and slid back down. Dreams of other spaces—secret rooms, hidden passages, forgotten access shafts—had become common for her in the last months. They were probably symbolic of something. She was just fitting a wire lead into a vacuum channel adapter when the dream changed, shifting under her like she'd switched to a different feed.

She was still in her real quarters, could see the real walls and light, but they were augmented by black spirals whose fine detail she was more aware of than the dim light could justify. They seemed to weave and reweave themselves as she watched them. Filaments of black thread that reached out, found each other, built together into a new shape that was also part of the old one. Tiny blue lights wove in and out of the constantly remade spirals too, glimmering like fireflies. As hypnagogic hallucinations went, it was probably the most beautiful her brain had ever come up with. She felt like she could watch the black spirals forever and never get bored.

Her father stood beside them, looking down at her. His eyes were a perfect blue that they hadn't been in reality. He was smiling. Teresa closed her eyes, willing herself to wake up. This wasn't a dream she wanted to have. When she opened them again, the spirals were gone, but her father was still there. He looked strange. His hair was longer than he'd worn it, and though he was in the tunic and trousers Kelly had dressed him in back on Laconia, he wasn't wearing shoes.

She sat up slowly, careful of the low gravity. The dream didn't fade.

"Teresa," he said, and his voice was like water to someone dying of thirst. Tears began to sheet her eyes.

"Father," she said, and even though she could feel the vibrations in her throat—even though she was almost certainly really speaking out loud—he didn't vanish. The sense of being awake grew in her. The sluggishness of dreams loosened its grip, but his image didn't fade. Not yet.

"Happy birthday," he said. "Everything is going to be all right."

She wiped the tears away with the back of her hand. "It's not, though," she whispered.

"It will. I only need a little more time, and we will all be together. I dreamed too small before. I can see better now. You'll see better too."

Teresa shook her head, and a sharp knock came at the door.

“You decent?” Alex’s muffled voice said.

“Yes,” she said, and the door opened a crack. For a moment, it seemed like her dream and her reality would come together face-to-face, but as the light spilled in, her father blinked back into nothingness. She wiped her eyes again, trying to hide that she’d been crying.

“Hey there,” Alex said. “We’ve got some grub. You hungry?”

“Sure,” Teresa said. “Give me a minute.”

Alex nodded and retreated, but Muskrat nosed the door open and hopped in, barely constrained by her own weight. Her brown eyes shifted around the room like she was looking for something, and she whined softly.

“It’s okay, old lady,” Teresa said. “Everything’s fine.”

It was almost true. Well, it was less untrue than it might have been, anyway. The *Rocinante* was almost at the New Egypt ring gate, and while the *Sparrowhawk*—far back down the local sun’s gravity well—apparently hadn’t died, it also was far enough that even a killing burn wouldn’t have been able to catch up with them. About to make a transit without a clear idea of the traffic through the ring space, and with the Laconian military chasing them but out of firing range, was as close to okay as Teresa could expect these days. But Timothy—Amos—had defied death again, Muskrat was still with her, and she wasn’t at a religious boarding school at the ass end of nowhere.

She was surprised how relieved the plan’s failure left her. The immediate aftermath had been fear and shock. The horror of seeing Amos’ shattered body, the violence of the firefight, the anxiety of wondering whether the *Sparrowhawk* would risk firing on them to get her back. But as soon as that had passed, she’d found herself smiling more. She was still here, and it wasn’t even her fault.

When she went out to the galley, the crew of the *Rocinante* were standing around a little table with a sad, yellow-white cake. It had two candles printed from medical resin in the shapes of a one and a six. The flames were almost spheres. It was pathetic.

“It’s pretty much the same yeast and fungus as everything else,” Naomi said. “But it’s got sugar and it looks nice.”

“It’s... You’re all very kind,” Teresa said. There was a knot in her throat that she didn’t understand. Maybe gratitude, maybe sorrow, maybe the chaotic wake of the powerful dream of her father. Amos and Jim started a

little song, and Naomi and Alex joined in, clapping along. It felt cheap and small and unimaginative, but it was also an effort they had put out for her that they didn't have to. When Alex told her to make a wish and blow out the candles, she just blew them out. She couldn't think of anything to wish for.

Amos plucked the resin candles out and dropped them into the recycler while Naomi cut the cake and Jim handed out bulbs of tea and coffee.

"Not a traditional breakfast," Naomi said, handing a corner piece to Teresa. "But we wanted to take a moment before the Freehold transit. Once we get in the shipyard, we'll be busy."

"Anything the ship needs, we better get now," Jim agreed.

Her last birthday had been in a ballroom of the State Building. The most important people in the vast spread of humanity had been there, and Teresa had been one of them. Her father had already been wrecked by the catastrophe that had destroyed the *Typhoon* and Medina Station, and she had felt the weight of the empire on her shoulders. She'd known what to wish for then. A way out. And now here she was, her wish granted. It wasn't at all what she'd imagined it would be.

She took a bite of the cake and it was... fine. Inoffensive. A little too dense, a little too dry, but fine. It wasn't made by the best bakers in a thousand worlds vying to impress their god-emperor. It wasn't preceded by a formal speech crafted to give the right political signals or followed by a presentation of ostentatious gifts that she didn't care about and wouldn't remember a week later. She couldn't imagine an experience less like the ones she'd had before. Even if they'd ignored her birthday, it would have been more familiar. There had been any number of times she'd felt ignored while standing in the spotlight.

Muskrat put a wet nose against her arm and barked a soft, conversational bark. Teresa broke off a corner of her cake and passed it over. The dog chewed loudly and with enthusiasm.

"What's up?" Jim said, and it took her a moment to realize he was talking to her.

"Nothing," she said. "Why?"

"You sighed."

"I did?"

Alex nodded. "You did."

“It’s nothing,” she said. “I was thinking about how different this is from last year. That’s all.”

“Not exactly the best Sweet Sixteen ever,” Alex said with a grimace. “This should have been the big one.”

“What are you talking about?” Jim said. “Last year was the big one. Quinceañera. Sweet Sixteen isn’t a thing.”

“Maybe not where you come from,” Alex said. “Mars, it was sixteen.”

Naomi scowled in affable confusion at Jim. “You mean quinsé? How do you know about that?”

Amos smiled an empty, friendly smile that meant he didn’t know or care what the others were talking about but he was willing to let them go on about it for a while. Sometimes he reminded her of a huge, patient dog in a crowd of puppies.

“Fifteenth birthday. Quinceañera,” Jim said. “It’s the big rite-of-passage birthday for a lot of Earth. Father Caesar was all about mine. We had a tent and a live band, and I had to wear a tailored suit and learn a dance. A bunch of people I barely knew put money in my educational account. It was fun in a mildly humiliating way.”

“Huh,” Naomi said. “I thought quinsé began in the Belt.”

“Did you have a dance?”

“There was dancing. And drinking.”

“Drinking at fifteen?” Alex said.

“Fifteen was the age when your parents lost their customs credit exemption and went back to paying full taxes and fees. So that was the age we usually took our first jobs. At least before the Transport Union. Pa changed the credit age to seventeen. But the party stayed the same.”

“So you left your parents when you were fifteen?” Teresa said.

“Before that,” Naomi said. “I didn’t know my father, and my mother had a long-term contract on a freighter that didn’t accept children. I was mostly with my tías. Some of them I was related to, but most I wasn’t.”

“I didn’t really know my mother,” Teresa said. “She died when I was young.”

“That’s hard,” Naomi said as if she was agreeing with something. Teresa waited for the next question. *How did she die?* She was sorry now that she’d brought it up. But no one pushed.

“I don’t know about any of that,” Alex said. “In Mariner Valley, it was

Sweet Sixteen. Unless it was thirteen. There was some of that too.”

“That why you were so pissed that we missed Kit’s?” Amos asked.

Alex looked down, a flash of pain covered over almost instantly by a good-humored ruefulness. “Me and Giselle were pretty much at our worst about then. Staying scarce was the right thing to do, but yeah. I was awfully sorry to miss it.”

Teresa took the last mouthful of her cake, to Muskrat’s visible disappointment. She’d spent most of a year with these four people. And after the epic failure that leaving her with her cousin on New Egypt had turned out to be, probably the next year too. Others had come and gone, but this central crew had remained the constant. Listening to them talk now was listening in on the idle chatter of a family. But it was a family she didn’t belong to. Part of that was that none of them was anything close to her age. When they talked about the time before the ring gates, it was like watching an old entertainment feed. The idea of all humanity trapped in a single system made her feel almost claustrophobic. It meant something different to them, and she could make out aspects of what that was. Her understanding would never mesh with theirs.

She watched Amos. He didn’t talk about birthdays or parents. Of the four, he was the one most like her—on the edge of the conversation. But he was comfortable there. He was comfortable anywhere.

She would never have what they did. Her experiences were only her own. No one else anywhere had lived the way she had, and people who had been closest to her were all back on Laconia or else dead. Other people could tie their stories together with analogies and patterns, how one person’s childhood birthday was like someone else’s, but her life had been too different. Nowhere in the universe would she find a table full of people whose fathers had groomed them to take control of humanity’s fate, who had been offered immortality and turned it down, whose private life had been synonymous with the function of a galaxy-spanning state.

The only hope she had was to find a place and start building, not a normal life but a comprehensible one. Then wait until it was all in the past and she could tell warm, shareable stories about it.

Even the idea was exhausting.

The alert was a polite chime. The ship letting them know that the moment had passed and the next thing was coming. They cleaned up the

detritus of the cake breakfast, and Alex gave her a brief, awkward side hug before he led Jim and Naomi toward the lift. She and Muskrat followed Amos down toward engineering.

“They mean well,” Teresa said.

“Yup.”

In engineering, Amos gave Muskrat a treat and took her to the canine couch while Teresa strapped herself in. The air smelled of silicone lubricant and the thin, harsh ozone that the ceramic printers gave off. It reminded her of the smell of rain, but without the minty tones, and it comforted her. How strange to have been in a place long enough that the smell of it felt like home. Or maybe she wouldn’t have felt that way except that she’d nearly lost it to a bunch of Presbyterians.

The transit out of New Egypt and into Freehold would go quickly. In theory, any two gates could be connected by a straight line, so that the angle at which a ship entered one could be set such that it didn’t need a braking burn. In practice, most ships came in slow, and often made their course corrections when they were fully in the ring space and could see their targets. Something about shooting blind through a gateway they couldn’t see, when missing it meant instant and utter annihilation, made the limbic systems of most pilots light up in a very bad way. This particular transit was in the sweet spot—not too far, but also not too steep an angle. If something did go wrong, the *Roci* would have time to shift its trajectory and exit some other ring.

At their present speed, the gap between gates would be brief, and the transits themselves wouldn’t be noticeable—one moment they would be in the eerie non-space of the ring gates, the next falling toward a distant star with the familiar universe around them. Amos strapped himself in across from her, scratching idly at his chest where the gunshot had opened him.

“Does it bother you?” she asked.

He looked over, his dark eyes wide and strangely innocent. Like a stuffed animal’s. She pointed at his chest as the countdown to transit began. Alex’s voice, professional with just the barest hint of anxiety.

“I don’t know,” Amos said. “Not really. I don’t like being dead, so...” He shrugged. “It is different, though.”

Alex reached zero, and Teresa imagined she felt a moment’s vertigo, but it was almost certainly psychosomatic. When Amos spoke again, his voice

was calm and amiable. One of the things she liked about him was that he never had the faint condescension of generic concern. “You’re thinking about your dad?”

“You didn’t choose what happened to you. How you changed. He did. And I don’t know which of you I’m more like, you know? I chose to leave. To be here. But there are so many things that I can’t—”

“We have a problem,” Naomi said over the ship-wide. “Stand by, and stay strapped.”

“Got you,” Amos said, but he was already pulling a mirror of the tactical controls onto the wall screen. Freehold system appeared, simplified by the shorthand of graphic design into something comprehensible. The sun. Freehold itself and the single other inner planet. The three gas giants. A dozen prospecting ships, mostly in the asteroid belt or the gas giant’s moons. Teresa looked for what had made Naomi’s voice so hard, and it took her a moment to find it.

The *Gathering Storm* was a Laconian destroyer, stolen by Roberta Draper. It was the flagship of the underground’s clandestine fleet, the tip of the spear during the siege of Laconia that had been Teresa’s own escape. To Admiral Trejo and the rest of the Laconian Navy, it was a humiliation and a thorn. A reminder of a string of losses. To the underground, it was a symbol of the empire’s vulnerability. It was the ship that might slip through any gate at any time, bringing the underground’s power to bear on any lesser ship, almost more powerful as a story than as a fighting vessel.

But the Laconian destroyer on the tactical display in low orbit around Freehold wasn’t the *Gathering Storm*.

Chapter Sixteen: Tanaka

The school medic looked like his voice had broken about half an hour before. If Tanaka hadn't known better, she'd have thought he was a student, not staff. He had dark skin, full lips, and hair cut close to the skull. In other circumstances, she'd have found him very pretty. As it was, she kind of hated him. For one thing, he was nervous with her. Every sentence he spoke rose at the end, so no matter how straightforward or obvious the statement, he bent it into a question. Also, some part of her limbic system had noticed that every time he was around, something happened that hurt or annoyed her. Changing dressings on her ruined cheek, needle sticks for the blood draws and support meds, scans in the school's antiquated autodoc. Something.

Worst of all, she probably owed her life to him.

Her men—Mugabo's strike team that she'd appropriated—were stripped of their equipment and buried already. Winston Duarte himself had ended the custom of bringing the dead back to Laconia for burial. *All soil is Laconian soil* had been the message then. Even with the profuse bleeding of head and face wounds, it would have been hard for her to hemorrhage to death on the dirt of Abbassia. But if someone had come and put a bullet in her, they'd have had a pretty good chance of blaming the murder on Holden and whatever the fuck his ship mechanic had become. She didn't remember being found or brought into the medical station. She didn't know if the medic had hesitated or if he'd been resolute to his Hippocratic oath. She did know without doubt that she had been vulnerable before him, that he had held her life in his young, unscarred hands. She hated him for that.

"I would very much recommend against any high-g maneuvers for at least three weeks?" he said as she packed her few remaining belongings into a sack. "Regrowth gel is very difficult on something that moves as much as a cheek?"

“I will have the very best care available,” she said, enunciating each word separately through the numbed ruins of her mouth. Holden’s bullet had cost her three upper teeth on the left side and most of her right cheek. There were microfractures from her palate up to her left orbital, and she was having headaches that left her swimming with pain. Those might have come from the fight with the black-eyed mechanic, though. Once enough things got fucked up in her skull, there wasn’t much point assigning an origin story to each of them.

“I think it would be wiser to wait? Another week to give the gel time to bond?”

Tanaka didn’t dignify that with a reply. Her armor was out in the courtyard, packed neatly for recovery along with what was salvageable from the dead fire team, and she walked out of the infirmary to join it, with the medic trailing behind her like a wisp of tissue stuck to her boot. The transport cart from the *Sparrowhawk* was a plume of dust, still half a klick from the campus. The faculty and staff of the academy watched her from their windows and doors with a mixture of fear and disapproval. She was the woman who’d swept down from the sky and locked them all away while their school turned into a free fire zone. An honorary degree would have been a little much to expect.

She smiled at the thought, then winced.

When the cart arrived, Mugabo was on it. His practiced formality was as crisp as a starched shirt. He braced and saluted her. It actually made her feel better. More herself. While his little crew loaded the arms and armor of their dead, Mugabo stood at her side, head tilted forward.

“You took your damn time,” she said.

“My apologies. The damage we sustained made atmospheric entry problematic, and your transport ship was... Unfortunately, we were forced to salvage certain equipment from it. I am very sorry for the delay.”

“Where do the repairs stand?”

Mugabo nodded, not meaning anything positive other than that he’d heard the question. “While the damage is significant, I am confident we can continue safely. My chief mechanic recommends a return to Laconia for resupply.”

“Are we short of something?”

“The composites that feed the hull are understandably diminished.”

“Meaning the self-repair functions aren’t working.”

“The hull’s integrity is within the error bars,” Mugabo said. She liked the way he deflected. He didn’t want to go to Laconia, his chief mechanic did. His ship wasn’t broken unless Tanaka was willing to permit it to be. There had always been that thread in the tapestry of Laconian culture: the willingness to assert whatever reality your commanding officer proposed. She wondered what Mugabo’s internal life was like. Did he have a reserve of freedom and perversity hidden inside, the way she did, or was he the same blankness all the way down?

She swung herself into the front seat beside the driver and looked out over the school. The battlefield. She’d lost here—lost her fire team, her target, her blood, and her flesh. Part of her reputation. And she’d lost it because she had been too slow to reach for violence. Teresa Duarte was precious—a resource of one. Irreplaceable. Holden had been willing to risk her where Tanaka had not. Lesson learned.

Part of her wanted to drop a missile on the school grounds from orbit and erase the site. She could do it. A few lives wiped out—including that fucking medic—and no one would prosecute her for it. The only consequence would be that people would know she’d done it. They’d guess at the embarrassment and shame that had driven the act.

So fuck it. Let them live.

Mugabo’s team finished the loading and clambered back into their places on the cart. Some peculiarity of the atmosphere refracted the sunlight into six bands like a child’s picture of a star. She remembered something she’d heard once: *I’d strike the sun if it insulted me*. She didn’t know where the line came from. It didn’t matter. She had a hunt to complete.

“We can go,” she said.

“Yes, sir,” Mugabo replied, and the cart lurched, turned, and sped away toward the landing point. The wind of their passage tasted like dirt. She took comfort in the knowledge that she could live a full, rich life and never once come back to this shithole of a planet. The thought helped, if only a little.

When they were back on the *Sparrowhawk* and burning for the ring gate, she submitted herself to the medical team. Walking into the infirmary of her own free will and not flinching as they made their examination pulled some of the sting of her first experience of the wounds. By the time they’d

checked the wound on her scalp, scraped the local regrowth gel out of her cheek, sewn a matrix in place, and put their own gel on, she felt better. It hurt badly, but showing them and herself that the pain was incidental was almost soothing. Mortification of the flesh had a long and glorious history among performance artists and religious zealots. She didn't think of herself as either, but maybe there was some overlap.

The new nerve endings itched, and her head throbbed if she stood up too quickly when they were under thrust. Otherwise, she was ready to get back to work, starting with her after-action report. She sat at the little desk in her office, and while the air recycler hummed and the vibrations of the drive fluted gently through the ship, she recounted the failed mission in careful, exacting detail. It was the moral equivalent of the gel scrape. Proof that she could take this pain too. She sent it to Trejo like an atheist confessing her sins. The ritual of cleansing with only a little vestigial sense of actually being clean. After that was done, the work.

In the time it had taken to put herself and the ship back together, the *Rocinante* had built up an impossible lead, burning past the one incoming merchant ship, the gas giants, and out toward the gate fast enough that there was no point laying on the speed to catch them. Whatever system they were going to, they'd be in by the time she reached the ring space. They couldn't outrun light, though. She sent the drive signature and silhouette of the ship's disguise out ahead, spreading the information to every system where the Laconian repeaters hadn't been spiked recently. Wherever Holden took the girl, Tanaka's forces would know to look for him. Maybe she'd get lucky.

Or maybe she wouldn't.

She spent long days going through reports on the other efforts she'd put into motion. The Science Directorate's analysis of the egg-thing from Laconia was consistent with the idea of an inertialess transport, and they were looking at strategies for tracing it. One theory was that the egg-ship's passage might leave a trail of free neutrons. She'd taken the Survey and Exploration Directorate off all its other work and tasked it with a report of all known alien structures in all systems. If Duarte had gone someplace, it was almost certain to be one of these. Activity in any of them would give her somewhere to start. But so far, no joy. Her orders to the Intelligence Directorate—checking on any close associates or former lovers of the high consul in case they'd suffered a visitation like Trejo's—resulted in a report

that was equal parts bureaucratic obfuscation and dead ends.

The whole thing left her angry. That was fine. Anger was comfortable. It was useful. She understood it.

She could remember to the moment the last time she'd felt self-pity. She'd been eleven years old and living in Innis Deep. Her parents had both died that year. Her mother had discovered something about her husband she couldn't live with, and one night she sabotaged the air system in their quarters and suffocated both of them as they slept. Tanaka had been sent to stay with her aunt Akari for the night. She wound up living there for the rest of her childhood. If her aunt knew what it was that had sent her mother into a murder-suicide rage, she never told.

Moving meant changing schools, and the transition combined with the unexplained loss of her parents had been difficult. One day after school, her aunt had found her sitting on her bed and crying. She demanded to know why. Tanaka admitted that a girl at her school had slapped her face and humiliated her.

Aunt Akari knelt down in front of her. She was an MCRN captain, and tall like all the Tanaka women. In her spotless uniform, Aliana thought her aunt looked like a warrior goddess. She'd waited for her to hug her close, then tell her she would take care of everything, the way her mother would have.

Instead, Aunt Akari had asked which cheek had been slapped. When Aliana pointed at it, her aunt had slapped her on the same cheek so hard it made her burst into tears again.

"Are you sad, or are you angry?" Aunt Akari had said, her voice gentle but insistent.

"I don't understand—" she had started to reply, when her aunt slapped her again.

"Are you sad, or are you angry?" she'd repeated.

"Why—" Akari slapped her before she could say more.

"Are you sad, or are you angry?"

She had wiped at the water in her eyes, afraid to say anything for fear of another slap. She looked at her beautiful but stern aunt's face, staring back at her without pity or compassion.

"Angry," Aliana finally said, and was surprised to discover it was true.

"Good," her aunt said, then stood up and held out her hand to pull

Aliana up off the bed. “Anger I can do something with. Sadness, fear, self-pity, self-doubt? They are inwardly focused. They keep you locked inside yourself. They’re useless. Anger is outwardly focused. Anger wants to take action. Anger is useful. Are you ready to use it?”

Aliana had nodded. It seemed safer than speaking.

“Then I’ll show you how.”

And she had.

Mugabo stood, arms behind him, with the same banal and pleasant almost-smile as always. “We have come near enough to the ring gate that it would be best if navigation knew where they should chart for.”

Tanaka leaned back in her seat. Her head hurt, but a little less than usual and she hadn’t taken the pain medication. Wouldn’t unless she needed it to function. The regrowth of her damaged bone ached, and the flesh of her cheek was slowly reknitting. The teeth would take a while. They needed something a little more solid to anchor to. That was fine.

Returning to Laconia was almost certainly the right thing, but it felt like admitting defeat. She had put it off until now, and she still chafed at the idea. She pressed at her broken orbit with the tips of her fingers, checking to see how hard she could push before the pain came.

“For the time being,” she began, “we should assume that the ship resupply will—”

Her comms chimed. A high-priority message had just arrived from the Laconia system. From Admiral Trejo. She let whatever she’d meant to say trail off and die, then looked up at Mugabo. He raised his eyebrows a millimeter like the waiter at an expensive restaurant waiting to see whether she approved of the wine.

“Let me get back to you on that, Captain,” she said.

“Of course,” he said with a sharp, professional nod. If he was annoyed at being put off yet again, he didn’t show it. She had the sense that she could prevaricate and delay forever and never get more than polite acceptance and

a repeat of the question an hour later. Mugabo was a man without passions as far as she could tell. He'd wear her down like water eroding a stone.

He closed the door behind him, and Tanaka put her system on a do-not-disturb setting that would keep anyone from intruding. Trejo's message wasn't large, but it had a datafile linked to it. A message within the message.

Trejo, looking out from her screen, seemed older than a few weeks could justify. It was all in the tone of his skin and the paleness of his lips, though. His eyes were still as sharp and bright as ever, and his voice belonged to a man thirty years younger than he was. She wondered if he was taking stimulants.

"Colonel," he said, looking into his camera. "I have reviewed your report, and... I think we can agree that could have gone better. We lost some good people on this, and you didn't secure your target. But I'm not sure we came away exactly empty-handed.

"For what it's worth, I would also have expected Nagata to put the girl someplace besides the gunship that the head of the underground was flying. But since she's chosen to keep so many of her eggs in a single basket, certain opportunities may be open to us that wouldn't have been otherwise."

Tanaka scratched her bandages. All she felt was a little pressure. The itch didn't subside at all. Trejo shifted in his chair and vanished. The image before her changed to a grainy visual telescopic view of a ship. It was hardly more than a dark shape against its own drive plume.

"I wanted to pass this along." Trejo's voice was calmer than she was. "It's from the *Derecho*. Botton's commanding it on a mission in Freehold system. Traffic analysis thinks they've still got the *Storm* hidden there, and he's trying to flush it out. A ship made an unscheduled transit into the system in the time period your alert specified. It's the right tonnage for the *Rocinante*, and the drive signature... Well, it doesn't match, but it's close enough that they could be running it dirty to throw us off. Thermally, it's the same story. Close enough to be faked. And the silhouette is very close. It reports—"

Tanaka stopped the playback. Her heart was going fast, and she was trying hard not to grin. It would hurt like hell if she did, and maybe even dislodge some of the regrowth matrix. But oh, she wanted to.

Mugabo accepted her comm request as soon as she'd made it.

“Colonel?”

“Resupply is going to have to wait,” she said. “We’re going to rendezvous with the *Derecho* in Freehold system. All deliberate speed.”

“Yes, Colonel,” Mugabo said. “I shall inform the navigator.”

She dropped the connection and let herself smile until it hurt just a little, savoring the moment. She tabbed Trejo’s message back and started it playing again.

“... silhouette is very close. It reports itself to be a survey ship on contract out of Auberon, and there’s a paper trail to support that. But Auberon system is so deeply infiltrated by the underground, I have to take that fact very, very lightly. I don’t know if this is a lead you’ll choose to follow, but it looks promising to me. And if it is Teresa Duarte’s ship, and if Teresa’s ship is James Holden and Naomi Nagata’s... Well, then I might have a strategy we can try.”

Tanaka leaned forward. There was something in Trejo’s voice that caught her. She didn’t know if it was regret or anticipation or something of both.

“Everything we’ve done with these people up to now has been less effective than I’d hoped. They’re smart, and worse than that, they’re fortunate. I know it sounds like superstition, but some people are just born lucky. I believe that. Regardless, I think there’s some value in changing our tactics. I’ve included a datafile for you to review.”

She opened the datafile in an inset screen. Another image of Trejo sitting at the same desk, speaking in the same cadence. The voices overlapped, each obscuring the other until she killed the inset and rolled back the main message.

“... datafile for you to review. This is your mission, and I’m not looking to steer from the rear on it, but I think this is the right way to go. If you agree, you should use it. We’re at the high-stakes table here. If we don’t finish what Duarte started... Well, I don’t want to go out thinking about all the things I didn’t have the balls to try.”

Chapter Seventeen: Naomi

The captain of the Laconian destroyer *Rising Derecho* had a pleasant face. Thin, high cheeks and a little pencil mustache that reminded Naomi of old entertainment feeds about the fight for Martian independence. His eyes were dark brown, his skin only a little lighter. He had the trick of making threats while being pained at the necessity of doing it. *This hurts me as much as it does you.* A lot of Laconians seemed to have that style. Naomi had to believe that said something about Winston Duarte and how he'd led.

"We have reached the hundred-hour mark. I will restate this again: We know that the *Gathering Storm* is in this system. It must be surrendered to us within the next hundred hours, or we will be forced to act against the civilian population. I beg that the leaders of the underground in this system consider how little they have to gain by their refusal to act, and how much they have to lose."

"They wouldn't really do it, would they?" Alex said. They were on the ops deck together, her and Alex and Jim. Amos and Teresa were in engineering, controlling the automated probes doing pointless make-work tasks on the surface of a small, volcanically active moon that circled one of Freehold's three gas giants.

"They would," Jim said. "More than they would. They will."

"It's civilians," Alex said.

"Yeah, but it's our civilians. So fuck 'em."

Botton looked soulfully into a camera in a warship orbiting a world whose population had grown to almost a hundred thousand over the years. "We are opening the channel to citizens of the city of Freehold in hopes that they will be able to reach your conscience."

The feed shifted to a young man, maybe sixteen years old, standing outside on the planetary surface with a small house in the frame behind him. When he spoke, his voice quavered. "My name is Charles Parker—"

Naomi killed the feed.

Freehold was one of the most important systems in the underground's network. It wasn't particularly well populated or wealthy. Draper Station, hidden on another moon of the same gas giant, was very small as military bases went. But it was the hiding place of the *Gathering Storm*, and that made it central to the underground's strength. Saba had known that would be true, back when Naomi had only been one of his chief lieutenants and not herself the center of the resistance to Laconia's empire. There were plans in place for how to keep Draper Station hidden when a Laconian presence was in-system. It was why the *Roci* had been ready at a moment's notice to pass itself off as the *Sidpai* operating out of Auberon. There was even a contract back in Auberon system to support the story, and a workplan backdated to seem it had been filed three months earlier that detailed the *Sidpai*'s mission to survey four sites in Freehold for possible mineral extraction. The second of the four was Draper Station, and they would make their approach to it when it was conveniently obscured from the *Derecho*'s direct line of sight.

The protocol now was to be what they pretended. Land where they said they'd be landing. Send out probes. Pull in data. Watch for signs that they'd been identified, and be ready to run like hell for the gate again if they were. Another transit to another system and hopefully no watchful Laconian eyes.

More traffic. More violence. No solutions. There were moments when it was easy to lose sight of all the progress the underground had made in hauling back the worst of Laconia's bad ideas and power. She only hoped that somewhere in the bowels of Laconia, Admiral Trejo felt at least as frustrated as she did.

When she went to make a request, Amos' comms were already open. "How's it going out there?"

She could almost hear the big man shrug. "If we were really getting paid for this, we wouldn't be covering the union in glory. But for a couple part-timers who don't usually run this kind of job? Pretty good."

"How long would it take to get all the equipment back into the barn?"

"Couple hours."

Jim looked over at her. "We're scheduled to be here for two more days."

"We did really, really good work, and got all the data we needed early," Naomi said. "Corporate back on Auberon will probably give us bonuses."

Haul it all back in, Amos. We need to leave.”

“You got it,” he said. She heard his voice over the comms as he turned to Teresa. *Playtime’s over. Time to pick up the toys.* He sounded almost like the man she’d known before he’d changed. Before they’d all changed, one way and another.

“I’ll get you some course options,” Alex said as he unstrapped and headed for the flight deck.

“Thank you,” Naomi said. She pulled up the comms and prepared the fake captain of the *Sidpai* to generate a report to the Laconians. She could almost imagine being a survey crew trying to keep its head down and finish its contract in the shadow of war crimes about to be committed. It was always like this. People trying to get their work done even while atrocities were blooming around them. Avoid eye contact and hope that the fire doesn’t spread to you and yours.

Jim sighed. “We’re going to have to do something about this. Not sure what it is, but... something.”

He seemed confused by her smile. “It’s why I’m moving the transfer up. We’ll figure it out.”

The acknowledgment from the *Derecho* came two hours later, and a human being hadn’t touched it. One ship system talking to another, as smooth and lacking in intention as meshing gears in a clockwork. The *Derecho* was looking for the *Storm*. The *Roci* wasn’t the *Storm*. And even if they were under suspicion, the Laconian strategy didn’t change. They had a gun to Charles Parker’s head and a hundred thousand heads like his, and a timer ticking down toward zero. If the *Sidpai* was a little sketchy, none of that changed.

The transit to Draper Station was a little brilliancy that showed how good Alex had become as a pilot. It followed a flowing path that exploited the gravity of the gas giant’s moons in their relative orbits, did nothing that looked out of place or implausible, and still landed the *Roci* with the body of the target moon obscuring the *Derecho*, and the gas giant keeping any ship coming in from the gate from seeing exactly where they landed.

With the strict comms blackout that protocol required, Naomi wasn’t certain what they’d find when they got there. When the first, almost inaudible navigation pings came, it felt like relief. Alex guided them into the hidden base gracefully. For the years he’d been Bobbie’s pilot, this had

been his home, and his intimacy with it showed in the ease of their passage. The *Storm* was in the secret dock along with two little in-system rock hoppers. The *Roci* edged into an open berth, the docking clamps locking on with a deep, gentle clank that rang through the ship. To the *Derecho*, it would look like the little survey ship had landed in a lava tube.

Jillian Houston was waiting for them when the airlock doors opened. She was smaller than Naomi thought of her being, pale hair pulled back but long. She wore a uniform-style jacket without insignia or signs of rank. The woman had served in no military besides the one they'd made up together.

The *Derecho* was a little under sixty-three hours from starting its bombardment of the planet, and it showed in her eyes.

"You've come at a difficult time, ma'am," Jillian said.

"I'm sorry there are so many of those," Naomi said.

"My father always says anything worth having is worth fighting for."

Naomi wasn't sure whether the bite in the words was really there or if she was just hearing what she expected. Bobbie had always given Jillian good if sometimes cautious evaluations, had promoted her up to be her second-in-command, and left the *Storm* to her care when she died, but Naomi wasn't Bobbie. The first time the *Roci* had come to Freehold, it had taken Jillian's father away as a prisoner. The alliance between Freehold and the underground had been one of the first steps in pushing back against Laconia, but Naomi couldn't help feeling that there was still a splinter from that first interaction.

"How is your father?" Naomi asked.

"He's planetside, ma'am." It was a prosaic way of saying *He's about to die*.

The others came out behind Naomi, Jim first, then Alex, Amos, and Teresa. Jillian's gaze lingered on Amos long enough that it almost became uncomfortable before she shifted to Alex.

"Good to see you again, Captain," Alex drawled.

"Welcome back, Mr. Kamal," she said, and Alex grinned.

"You keeping the ship in trim?"

"You won't find any dust on her," Jillian said, then shifted her attention back to Naomi. "I didn't know what you needed for the resupply, but your time here's short. I got everything ready that I could. We have some quarters set aside for you to rest. It might be a little loud on your ship."

“I can walk your techs through what we’re short on,” Amos said. “It’s going to be better if we load up and get out quick. Especially since we’re such a crack surveying team now.”

If his appearance unnerved Jillian, she didn’t show it. “Come with me. I’ll get you started.”

The gravity on the moon was hardly more than a suggestion. The rock of the corridors was coated with sealants and braced. None of the stone here had been compressed by a gravity well strong enough to make it hard. Naomi had the sense that she could have dug her way through it with her bare hands like it was packing foam. It was only the human structures that made it feel solid.

The dockworkers and supply techs were a mixed bunch. Naomi recognized old-school OPA by their tattoos and the quick, well-practiced actions that came from a life spent close to vacuum, but there were also younger men and women. People Jillian’s age who had come to the underground from the bottom of gravity wells and made their way here. There were more since the siege of Laconia. The empire’s loss had given a lot of people hope. She wasn’t certain she was one of them.

The *Rocinante* could plausibly stay on their false survey mission for three or four days. That was long enough to top up all their tanks and swap out their air scrubbers and recycling matrix, and do some of the smaller hull repairs. It was long enough that they would be on hand to watch the civilian population of Freehold die.

When the resupply and repairs were all agreed on and the process was underway, fifty-nine hours were left. Naomi went to the quarters Jillian had mentioned: narrow rooms with cots and blankets around a small private galley and head. The *Roci* was more spacious. Jim was curled up, napping. Naomi wanted nothing more than to curl up beside him. Instead, she sent a comm request to Jillian. The reply was directions to her on-base office.

She thought about waking Jim and bringing him along with her. He had a way of smoothing some conversations just by being in the room. But this was her burden to carry. He’d be there later if she needed him.

The office was small, with screens on two walls and the surface of the desk. The parts of the walls not taken up with images of the *Derecho* and Freehold, the security map of the station, the status of the *Storm* and the *Rocinante*, and the environmental status were painted a grayish orange. It

would have looked good with some blue beside it. Jillian, seated, waved her in, and Naomi pulled the door closed behind her.

"I didn't know Freehold was under attack," she said.

Jillian didn't look her in the eye. "The fucker blew out our repeater at the ring and dropped one of their own as soon as they came through. There wasn't a way to raise the red flag. I apologize."

"It wasn't criticism. I'm afraid we've made the situation worse."

"I don't know that's possible. But we do need to talk about our options now that you're here."

Jillian's right hand closed into a fist, then opened, and closed again. It wasn't the only sign of distress, but it was the most obvious one. Naomi breathed into the version of herself that was cold, analytic, and ruthless. She'd never wanted to be a war leader. The universe had insisted.

"You have plans?"

"A plan," Jillian said. "The *Storm* is ready to evacuate. It's already loaded with all the supplies she'll carry and the parts of the station we could take down and stow. We break cover and get the enemy to follow us. Get out through the ring, transit to a different system, and start building a fresh base."

"So abandon Draper entirely?"

"It's not useful for anything but the *Storm*," Jillian said. "And it's less useful for that than it could be."

Naomi frowned, motioning Jillian on.

"Freehold's strategic importance was that no one knew we were here. That's spent now. I don't know if their traffic analysis is better than ours or someone leaked something. Shit, it could just have been a good guess. But they're here. Keeping the base at this point is just holding on out of spite."

"And the *Derecho* might chase you," Naomi said. "Leave the civilians alone and come for you. That's the idea, isn't it?"

"It's the hope. We've got... We've got recording stations in all the major towns. If it does come down to a bloodbath, it won't be a quiet one. We'll hang what they do here around their necks in every system with a radio. They know that too. It might help dissuade them."

"What about direct confrontation? The *Derecho*'s a strong ship, but it's the same class as the *Storm*. We have another gunship now. And if you have any other vessels or planetary defenses to throw in the mix—"

“We can look at it,” Jillian said. “It’s not apples to apples, though. Their ship is fresh and well supplied. And the *Storm*... It’s not in fighting condition. Not the way it should be.”

“Why not?”

“We don’t have the Laconian supplies or the repair equipment or the expertise. And we’ve been running the hell out of her for years. She’s a good ship, but she’s showing some age.”

Naomi heard what Jillian was moving toward. Hinting at, maybe without even being aware she was doing it. The younger woman was talking herself into a story where losing the ship, losing the base, wouldn’t be that bad. She was looking for the way that the massacre could be avoided, even if it meant surrender.

It struck Naomi that desperation could be like a fractal: constantly changing but also the same at every level. The citizens of Freehold, afraid that their last days were upon them. Jillian grasping for any way to save her people. Naomi’s own grinding, frustrated fight to keep ships from going dutchman and build something to rival the authoritarian, vicious empire. Elvi Okoye, risking her life for any way to stop the things from beyond the ring gates and their waves of hostility and weirdness. No matter how far out your point of view, the fear and desperation were the same at every level.

The alert took them both by surprise. Jillian shifted the image from the *Derecho* to the distant ring gate and the comet-bright drive plume of a ship that had just made the transit.

“Were you expecting someone?” Jillian asked as she redirected the base’s passive sensors toward this new target. Naomi didn’t answer. Slowly, the image resolved until the silhouette was almost clear. The ship was Laconian and familiar. And while she would have to query the *Rocinante* for the drive signature, she was already certain that it would match the *Sparrowhawk*.

“It’s from New Egypt,” she said. “It’s hunting us.”

Jillian’s soft exhalation was as good as a curse. If they’d been short on good options before, now they were out. If they tried to run, it meant going past an incoming enemy, and even if they could slip past it, the *Sparrowhawk* would be able to reach the ring gates with them and report back where they’d gone. If they tried to fight, they’d be outmatched.

I’m so sorry was at the back of Naomi’s mouth when Jillian made a soft,

surprised grunt. “What is it?” she asked instead.

“The new ship? It’s transmitting.”

“To the *Derecho*?”

“Not tightbeam,” Jillian said. “It’s broadcast. Just radio spectrum transmission.”

Naomi frowned. Point-to-point tightbeam was more secure than any broadcast, no matter how effective the encryption. The *Sparrowhawk*’s laser might not be strong enough to reach the *Derecho* or it might have lost alignment in the damage the *Roci* had done it. Or...

“Are there other ships in the system?” Naomi asked. “Is it signaling more than just the *Derecho*?”

Jillian pulled the base’s comm controls to her own desk, her fingers dancing over the screen. A scowl drew lines across her forehead and down the sides of her mouth. “Yes, it is. And it’s cleartext. They’re not even hiding it.”

“Is there an address flag? Who are they talking to?”

“You,” Jillian said. “They’re talking to you.” She shifted the comms playback to the larger wall screen.

The de facto leader of the Laconian Empire looked out at them both with startling green eyes and a smile Naomi could only call rueful. When he spoke, he sounded like a reed instrument, played softly.

“This message is for Naomi Nagata. My name is Anton Trejo. I think you know who I am and the situation we’re both in. It’s past time that you and I talk. I would like to propose an alliance...”

Chapter Eighteen: Jim

The panic was deep and irrational. It felt so much like the station itself was vibrating that Jim had to physically test that it was really just him. He realized the message had been playing and he didn't know what it had said. He slid it back to the start, breathing deeply, and tried to keep his mind from bouncing off it again.

"This message is for Naomi Nagata. My name is Anton Trejo. I think you know who I am and the situation we're both in. It's past time that you and I talk. I would like to propose an alliance.

"We have our differences, and I'm not here to underplay or deny that. We also have access to certain information that makes clear the vulnerabilities that we're both trying to address in our ways. We share a problem, you and I. The ring space and the unknown entities within it pose an existential threat for humanity. We must control access to the rings to limit this danger. We also both know that when it comes to getting people to deny their own immediate needs in favor of a greater good, asking nicely almost never works."

Trejo spread his hands in a gesture of powerlessness. *What option do they give us?* Jim's hands ached, and he forced his fists to unclench.

"I have here a copy of a document you wrote. Protocols for the safer use of the gates. I also have my own traffic analysis data that tell how well this project is going for you. I've had my best people analyze it and I have to say, it's a damned good piece of work. Solid. If it were put in place, it might go a long way toward managing the threat of these incidents. The only thing it's missing is a method of enforcement. Out of a shared concern for humanity as a whole and in recognition of our common history and moral bonds, I would like to put my forces at your disposal. On behalf of Laconia and High Consul Duarte, I am offering the underground not just armistice, but collaboration.

“We have to end these petty squabbles and fights. I think you know that. And I am willing to do so. Furthermore, I will commit to stationing two Laconian destroyers inside the ring space, even with the risk that we both know that exposes them to, with the sole mission of enforcing your transit protocol. We will not take aggressive action. We will not limit or control trade. I will guarantee the safety of any ship making use of the gates, and grant blanket amnesty for the underground.

“And I will begin by reassigning the forces presently in Freehold to that mission,” Trejo said. “That’s my offer. A unified front against the real enemies of humanity. And all I’d ask from you, as a gesture of your trust and goodwill, is the return of your present passenger. You know as well as I do that she’s in no danger from us. We only want to bring her home. And with this rapprochement between us, there’s no reason for her to be living in exile.”

The message ended, and for a moment, Jim wasn’t there. The cabin in Draper Station, the cot, the soft gravity, all of it was still present, but it became less immediate, less real than the holding cell in the depths of Laconia’s State Building. The fear was real, but more than that was the twin sense of despair and responsibility. The conviction that everything depended on him, and that he was powerless. Like watching something precious and delicate falling, and knowing that he couldn’t get to it in time. Everything was going to break, and even though there was nothing he could do, the grief pressed on him like he was the only one carrying it.

He’d done so much, tried so hard, and accomplished so little. And now they were coming to ask their questions and drown his answers out with pain until he’d say anything. Or they wouldn’t ask anything, they’d just beat him until he understood that he was at their mercy, and they were merciless.

A small, still part of him that watched the rest of his mind noticed how odd it was. When he’d been a prisoner on Laconia, he’d been able to hold himself together. To rise to the occasion, plan, scheme, and even suffer with a resolve that he couldn’t find now. After he’d escaped, he’d felt euphoric. Calm and whole and returned to the life he’d given up hoping for.

But the honeymoon faded, and the version of him it left behind was scarred and broken. He didn’t feel weak. He felt annihilated.

Years were gone. Years of prison and torture, which had been bad, and of pretending to be an honored guest while the threat of death invisibly

followed one step behind. The dancing bear years. They'd been the worst because they'd broken down his sense of himself. Of who he was. Of what was true. The Jim Holden who had tripped the alarms in Medina Station was gone. The Jim who'd schemed against Cortázar and for Elvi Okoye had been half a lie from the start. He was all that was left. The dregs of himself. The scrapings.

Jim. Jim, come back to me.

His awareness shifted. The little cabin came back into focus like someone was tuning a video screen. Naomi was there. He didn't remember her coming in. She was holding his hand.

"Hey," he said, trying to sound bright and cheerful. "Imagine meeting you here."

"You saw the message then?"

"Yup. Yes. Indeed I did."

"I was hoping you were still asleep. I should have come here first."

"No," he said, "I'm fine. Just processing a little old trauma. Thinking about what to have for dinner. The usual. What did I miss?"

"We don't have to talk about this now."

"It won't help," he said, and squeezed her fingers in his. "Not talking about it? It won't help. If you're here, I'll be fine. Getting it out will help me even. Promise." He didn't know that was true, but he didn't know that it wasn't.

He could see it when she decided to believe him.

"He's surrendering," Naomi said.

"Only if he gets to be your police force," Jim said. "That's not what surrendering means."

"I read the agreement he sent," she said. "He really has seen my traffic control protocol. It's almost word for word in some places. And it puts his ships at my command."

"All right."

"He wants to make the underground into a new Transport Union. We'd be responsible for setting policy. We'd be independent of the Laconian hierarchy. We'd have the authority to deny passage to Laconian ships."

"And you're thinking?"

"That it smells like bullshit. Sounds too good to be true," she said. "But... How else do peace treaties get made? That happens, doesn't it?"

History's full of wars that ended because people chose to end them. We hurt Laconia badly. We broke the construction platforms, and they're not coming back. Not anytime soon. Duarte was the architect of the whole thing, and he's off the board. The glitches where people turn off or the rules of physics change? They're the threat."

"They are," Jim agreed.

Naomi shook her head once. "Everything in me says the offer's a trap, but if it isn't, and I turn away? If this isn't the opening I was looking for, I'm not sure what our goal is with them."

The door to the little common room opened, and Alex's and Teresa's voices mixed, talking over each other. Muskrat barked once, a low conversational woof. Naomi leaned close, pressing her forehead to his like they were both wearing helmets and she wanted to say something only he could hear.

"I'll be okay," he said. "I'm better. I'm fine."

"Hey, back there," Amos said. "You talking about the thing?"

"We'll be right out," Jim said, loud enough to carry.

She put a hand on the top of his head, like she was gently hugging it, and then they walked out together. Alex and Teresa were leaning against the walls, Amos sitting on the floor idly scratching Muskrat's neck. The dog smiled her soft, canine smile, looking from Amos to Teresa and back.

"How's the resupply going?" Naomi asked.

"Good," Alex said. "We have a good pit crew here. Always have had."

"I keep forgetting how long this was home for you," Jim said. "I missed that part."

"These are good people," Alex said. It occurred to Jim how many families Alex had gathered on his path through life. His time in the navy, his first wife, the crew of the *Canterbury*. He might not be good at marriage, but he had a talent for making homes. Or finding them.

"Repairs are something different," Amos said. "They'll take longer, and some of them, if we start we'll be grounded until they're complete. That could take longer than the folks on Freehold have got. I thought we should hold off until we were sure."

Naomi nodded and pressed her thumb against her lower lip the way she did sometimes when she was thinking. She looked old, which was fair. They were both old. But more than that, she looked hard, and Jim wasn't

sure they were hard. Only that they'd had to act that way so many times in so many situations. They'd gotten good at it, her and him both.

"And that brings us back to the thing, doesn't it?" Jim said.

"It does," Amos said.

"What do you think?" Naomi asked, as if Amos were the same man he'd been before.

"I think he didn't say what happens if you turn him down. I'm guessing it's pretty much where we're at now."

"In that case, we've got a little over two days before the *Derecho* starts killing people," Jim said. "We've got a little more than that before we need to leave here, assuming that our cover isn't totally shredded."

"Oh, our cover's totally shredded," Amos said. "I thought that was a gimme."

"It is," Naomi said. "We don't have a lot of options, and what we have got are bad."

"What do you mean? You hand me over," Teresa said. "Are we talking about this? Obviously you hand me over."

"It's a little more complicated than that, Tiny," Amos said.

The girl furrowed her brow. "I'm not worth a hundred thousand people."

Jim raised his hand like a student in a classroom. "Are you saying that you want to go back?"

"No, I don't. Being there was killing me, but I'm one person and they're most of a planet. You're going to hand me over. You *have* to."

"I don't have to," Amos said with a deceptive mildness. Jim heard the expectation of violence behind it, even if Teresa didn't.

"Are we thinking that Trejo means what he says?" Alex said. "Just looking at the logistics? I don't love it. If we did let Teresa go back, that means showing ourselves. Docking with one of their ships, maybe. And I've seen their power suits in action. If they decided to board us, they could go through us like tissue paper."

Teresa's frown shifted. It was fascinating. Knowing Laconia as well as she did, having seen it from as far inside as anyone could be, her first instinct was still to trust them. If Trejo was making the offer, it must be real. He must be sincere. A part of Jim wondered if that might not be a truer guide than his distrust or Naomi's. The fresh eyes of the young seeing more clearly, or else the benefit of experience showing where the traps were set.

“Trejo was a Martian before he was Laconian,” Alex went on. “He betrayed his nation. I’m not sure that says a lot in favor of him keeping his word now.”

“My father was Martian too,” Teresa said, but there was no real heat in the words. More like she was thinking something through.

“The question is whether we can trust him to do what he’s promising,” Jim said. “The answer to that is inside Trejo’s skull, and we don’t have access to it. It’s just which side do we bet on?”

“That’s not the only question,” Amos said. “If we hand over Tiny, are we still the good guys? That’s a question too.”

“It is,” Jim agreed.

“If you can choose between one person and a hundred thousand, it’s not a hard call,” Teresa said. “I won’t even die.”

But Naomi’s gaze had turned inward. Something in Teresa’s words had done the trick. Jim saw her understand even before he knew what she’d understood. Naomi lifted her eyebrows and shook her head, just a millimeter back and forth.

“You know what this is?” she said. “This is him making me responsible for what he does. Teresa’s right. She’s got exactly the frame I’m supposed to use. One person for a multitude. But I’m not looking to kill a multitude. That’s him. If I do what he says, I’ll be saving all the people he would kill to punish me if I didn’t.”

Amos’ laugh was almost the same timbre and cadence as Muskrat’s little bark. When he spoke, he was mimicking the soft, threatening whine of an abusive lover. “Look what you made me do, baby. Why do you have to make me so mad?”

“That’s it,” Naomi said. “I couldn’t put my finger on it, but that’s why I can’t do this. He’s holding a gun to their heads and then pretending that I’m the only one who can decide whether he pulls the trigger. That’s not a trust exercise. It’s just another threat.”

“Don’t forget the surrender. The amnesty,” Jim said. “There’s a carrot along with the stick.”

“Carrots don’t matter when he still gets to hold the stick,” Naomi said. “I’m done with sticks. Sticks are disqualifying. If he’d led by pulling the *Derecho* back from Freehold, it would be a different thing. He didn’t. He chose this, and I don’t trust him.”

Jim smiled at her. “Also, he’s asking us to hand over to him a young girl who doesn’t want to go, so fuck him. We don’t do that.”

“Fuck him,” Amos agreed.

The room was silent. Naomi pursed her lips and shook her head almost imperceptibly, continuing the conversation in her head. He wondered what she was saying, and to whom. He had the sense that, whoever they were, they were probably happier not being present for it.

“We’ve got two good ships,” he said.

“We’ve got two ships anyway,” Amos said. “I love ’em both, but the *Roci*’s feeling her years and the *Storm*’s gone a long way between updates.”

“We’ve got two mostly okay ships,” Jim said. “Not bad anyway. We load up everyone on Draper Station, burn hard for the ring gate, and take the *Sparrowhawk* out if it tries to stop us. With the *Storm* in the open, no reason to bomb Freehold anymore. At least the planet would be safe.”

“Best bad plan we’ve got,” Naomi said.

Jim headed for the door. He almost felt like himself again. The panic and fear weren’t gone, but they’d grown smaller. Manageable. “First thing is make sure we’re all the way topped up on rail-gun slugs,” he said, and pulled the handle. The door didn’t move, and an alert popped up on the locking panel. The error was so out of place that he pulled on the door twice more before he understood what he was seeing. EMERGENCY LOCKDOWN. VACUUM HAZARD.

“Uh, that’s weird,” he said.

Naomi was already on her hand terminal. “Jillian. What’s going on?”

The voice that answered was hard and brittle. “I understand that you’re upset, ma’am.”

“What did you do?”

“While I respect the civilian branch of the underground which you represent, this is a military matter. The enemy has a hundred thousand of our people they’re prepared to spare in exchange for one girl who they aren’t even going to hurt. There’s no dishonor in a prisoner exchange.”

“Do you think Trejo’s really going to walk away once he’s got her?” Naomi said. Rage buzzed, but she didn’t raise her voice.

“According to our best sources on the man, he will honor his word,” Jillian said.

“You don’t get to make that call,” Naomi said. “That’s my job.”

“Respectfully? As the captain of the *Gathering Storm*, which is the flagship of our military branch, I have authority over military decisions. This is a military decision.”

“Jillian,” Alex said, loud enough for Naomi’s hand terminal to pick him up. “You don’t need to do this. Bobbie wouldn’t have done this.”

“Captain Draper understood that one individual can’t stand in the way of the greater good, Mr. Kamal. If she were here, she’d be doing the same thing I’m doing.”

Amos chuckled. “You can tell yourself that, Sunshine. Don’t make it true.”

“The *Sparrowhawk* is on its way with a representative of Laconia. The *Derecho* is burning this way as an escort force with an understanding that both ships will leave the system once the handoff is complete. Until it is, I’m restricting you all to your quarters,” Jillian said. “Once this is over, and your emotions are calm enough that you can see that this decision was correct, we can discuss whether you want to fracture the underground’s leadership or back my authority.”

“Jillian,” Naomi said, but the connection was dead.

The walls of the common room felt as small as a cell, and the fear rolled up Jim’s spine, as fresh and angry as if he’d never put a lid on it. The others were talking, their voices washing over each other. Alex saying *I can talk sense into her if we can just get her to pick up again*. Amos guessing out loud how long it would take to get down the hallway in hard vacuum, and whether the rest of them would survive even if he did. Naomi repeating Jillian’s name again, trying the connection. He was the only one who stayed quiet. Or, no, Teresa did too.

She looked at him like they were alone together. He nodded to her. She nodded back.

Chapter Nineteen: Kit

Their cabin on the *Preiss* was so small that if Rohi were standing in it, he couldn't cross the room without brushing against her. The thick cloth covering the metal bulkheads was an unappetizing olive color with location and maintenance data woven into the fabric in orange thread. The wall screen was hardly bigger than two handhelds put side by side and had a protective coating that never seemed clean no matter how much Kit wiped it down. Their crash couches were old gel and badly designed, built into cubbies in the wall that could pinch fingers and toes if they weren't careful. Bakari's couch was welded to the deck, the metal still bright where it had been put in. It was a much better design.

It was their only private space for the next few months while the *Preiss* burned out to the ring gate, made the transit to Nieuwestad system, and then burned to Fortuna Sittard—the capital city on the main habitable planet.

They shared a common galley, microgymnasium, and showers with six other cabins. Someone had put up the city flag of their new home: green and red with a black-and-white patterned circle in the center that looked suspiciously like a football. The door directly across from them belonged to a pair of brothers from Breach Candy who had left their mother's old salvage company for a contract on Nieuwestad, giving up the family trade of breaking down old terraforming equipment to build controlled environments in the unfamiliar biology of a new world. Kit worried that Bakari's crying kept the brothers awake, but if it did, they didn't complain.

One of the farther cabins had a woman with her preteen daughter, who Rohi had taken on as a kind of in-transit project to know better. Kit had the impression that the woman was leaving a bad marriage and that the daughter was seeing a therapist who was making the same transit, but four decks down.

Kit felt a little uncomfortable knowing even that much but recognized

that his aversion to hearing about other people's family history was mostly projection. He'd spent so much of his life avoiding talking about who his father was that hearing about someone else's felt a little dangerous.

Kit centered himself in the camera, then shifted so that Bakari, napping in the pressure wrap strapped across his chest, also appeared. He started the recording.

"Hey, Dad. Don't know where you are or when you'll get this, but I wanted to check in. The little bear is right here too."

Kit shifted to put Bakari's face more clearly in the frame—the scrim of tightly curled, fine black hair on his scalp; the full, soft lips pursing and relaxing as he dreamed; the eyelids as dark as if he were wearing eye shadow. Kit gave his father, where and whenever he was, a long look at his grandson, then shifted back.

"We've been on the float for five days so far. He's taking to it better than I am. The ship infirmary has a resistance gel chamber he can use, but we're not the only family on board that needs it, so we have to schedule times. Rohi thinks it's important, though. And she's probably right. Anyway, he doesn't like it, but he sleeps like a beast afterward. So that's good. I'm doing fine. Rohi's doing fine. If we can still stand each other when we get to Nieuwestad, I think it means we're destined to stay married forever. Living this close to someone isn't what I'm used to."

He paused for a moment, wondering whether he should go back and start the recording again. Joking with his father about divorce and shipboard life might seem pointed, and he didn't want to seem critical. But Bakari shifted a little. The nap wouldn't last forever, and it was harder to make a message when the baby was awake.

He felt the tug again—protecting his father on one hand and his son on the other. Kit always fell into the middle place between his mother and his father, his mother and Rohi, the contract association and his family. His mother said he got his peacemaker instincts from his father. Maybe that was true, but it hadn't been his experience of Alex Kamal.

He realized how long he'd been quiet and smiled an apology to the camera.

"Anyway," he said, "the doctor says the boy's fine. We're not going to do the adaptation cocktail. They say as young as he is, it would do more harm than good. As long as he gets his exercise time in and we make sure

he gets enough rest when we get planetside, he'll adapt faster than we will.

"Everything's looking good here. Going according to plan. We'll be making the ring transit pretty soon now. That's really the only scary part of this whole trip. But Bakari is going to take his first steps on Nieuwestad. He won't even remember Mars. I hope you'll get a chance to come see him. I don't know that it'll mean much to him, but it would mean a lot to me. You'd like Rohi, and you'd love the little bear here. I hope wherever you are, you're okay and things aren't any weirder than they have to be.

"Take care of yourself, Grandpa."

He ended the recording, then played it back. The gap where he'd lost himself in thought wasn't as noticeable as he'd feared, so he saved the message, encrypted it, and queued it for delivery to the address that Alex had given him for the underground. He didn't know where it would go from there. He didn't play with political issues except when the nature of his family demanded it.

It was a risk, but only a little one. Alex understood that if Laconian security forces came calling, Kit would cooperate with them to save himself and his family. They hadn't yet, apart from a meeting his mother had a year before. Kit seemed beneath their notice, and hopefully getting out to the colonies would put him even further off Laconia's radar. That was the other reason he'd wanted to take this contract. The reason he didn't discuss with Rohi.

Bakari yawned, his eyes still closed, and shifted against Kit's chest. He'd be awake soon, which if tradition held would mean milk and a diaper change. Kit sent a quick message to Rohi: NOT AWAKE, BUT WAKING.

They had formula mixed and ready to go, but Rohi still believed in breastfeeding, and while Kit was able to do a lot to take care of his son, that was a full-on mother-baby thing he was happy to tag out for. Also, he could go to their little gym and get his daily sweating done.

Bakari wrinkled his nose the way he had since they'd seen him in a sonogram, and opened his bright, dark eyes. His focus swam a little, then found Kit's eyes looking back at him. Bakari made a little *bap* sound, not even babbling so much as muttering to himself. If he didn't seem to take any particular joy in seeing his father, it was probably because Kit was almost always there. It made him feel obscurely proud to be so taken for

granted.

He was debating to himself whether to message Rohi again or get a round of formula ready when the cabin door slid open. As soon as he saw her face, he knew something was wrong.

“Babe?” he said.

“I’m here.” She gestured to Bakari, and Kit unfolded the boy from his pressure wrap. Bakari slowly windmilled his arms and legs, no distress in his movement at all. As if flying weightless through the air was as natural as anything else. Rohi scooped a hand around him and pulled him close. The baby, knowing what came next, was already plucking at the flight suit over her breast. Like a sleepwalker, Rohi pulled her suit open and guided him to her nipple.

“Babe,” Kit said again. “What happened?”

Rohi took a deep breath, like a diver looking down toward distant water. “There was another blink. San Esteban system.”

Kit felt his gut tighten, but only a little. He’d been through a half dozen rounds of the aliens from inside the rings turning off his mind for him. Everyone in Sol had.

“How bad was it?” he asked.

“They’re dead,” Rohi said. “Everyone in the system. They’re all just dead.”

Chapter Twenty: Elvi

San Esteban system was one of the first wave of colonial settlements, surveyed and studied by her old employer Royal Charter Energy. It had one habitable planet, and a moon around a gas giant with a breathable atmosphere. It had the first parallax station that had mapped out the relative locations of the ring systems through the galaxy. Eighteen million people spread across ten cities, a semi-autonomous aquafarming platform the size of Greenland, and a research station in the stagnation zone of the heliosheath, 110 AU out. It had reached the technical specifications for self-sufficiency three years ago, but it still imported supplies from Sol, Auberon, and Bara Gaon.

Which was why the *Amaterasu*, a freighter out of Sol system with a cargo of high-purity industrial reagents and refining equipment, risked the transit and passed through the San Esteban gate.

Elvi shifted through the images the ship's traumatized physician had sent back. She'd seen them all a dozen times before, listened to the recordings he'd made, and read the field autopsies.

The dead man on her screen was in a bag somewhere right now, heading to Laconia and the Science Directorate for a more thorough examination. Elvi tilted her head and considered the wetness along the back of the corpse's jumpsuit, the tightness where death bloat had pressed the fabric smooth, the way eyes had sunken as they'd given up their moisture to the air. According to his ID and the genetic sample, he'd been an engineering intern at a supply station, and one of the first corpses they'd recovered. He had once been a man named Alejandro Lowry. He was just SanEstebanCadaver-001 now.

The voices that played as she reviewed the dead weren't from San Esteban. She'd listened to the captain and physician of the *Amaterasu* enough to know there wasn't much they could tell her. She'd gone farther to

find insight. She was listening to James Holden and a woman with a long, slow accent that Elvi thought of as Mariner Valley but was a kind of Laconian now.

Tell me about the systems going dark, the interrogator said.

It was just one at first, Jim replied. *And the... group consciousness? Consensus? I don't know the right word for it. The chorus. They weren't even particularly worried. Not at first.*

Elvi switched to an exterior. An older woman—gray, swirling hair—lying in sunlight. An animal Elvi didn't recognize lay beside the human corpse. It looked something like a small, insectile pig. Compound eyes on either side of a long skull-like structure. A prey species, then, and it appeared to have died at the same time as the woman. She pulled up an article on the species and what was known of the anatomy and physiology of San Esteban's tree of life.

Then there were more. Just a few. I mean, like three or four. Even then, it wasn't more than a curiosity, Jim said.

What was left in the system? Were there bodies? Did the aliens just disappear? the interrogator asked.

It wasn't like that, Jim said. *The systems just went dark. Like losing a comm channel.*

Then how were they certain the systems were dead?

They were all connected. If someone cuts off your hand, is it dead? So yeah, the systems were dead.

Because, Elvi thought, the builders or the Romans or the space jellyfish—the beings of light—hadn't known what it was to be alone since they'd learned to glow in that ancient, freezing ocean. They were individuals and they were a unity. A superorganism, connected as intimately as she was with her own limbs and organs. She found a paper speculating about the internal signal transfer in the bug-pig animal and let her eyes flow over it, catching the gist without diving down on details.

But they decided based on just that to destroy whole systems? the interrogator asked.

It was like cutting mold off a block of cheese. Or a clump of cancer cells on your skin. There was a bad spot, and so they burned it off. They didn't need it. They thought it would stop.

What would stop, exactly?

The darkness. The death.

“Hey,” Fayez said, and Elvi stopped the recording just as the interrogator started her next question.

“Hey,” she said, making it a sigh.

He floated in the door of her office. He looked tired. He looked fragile. Everyone did now. Everyone was.

“The relief drone from Laconia just popped through the gate,” he said. “Another couple weeks for it to match orbit, and we’ll be eating pretty much the same thing we’re eating now, but with different atoms in it.”

“Good. Hope we’re here when it is.”

She’d meant it to be funny. A morbid joke. The words tasted like chalk. The distress in her husband’s eyes was brief, and after it, he chose to smile.

“What’re you listening to?”

Elvi looked at the speakers mounted in the cloth of her office walls as if it would help her remember. “Um. James Holden. Some of his debriefing from when he was on Laconia. I’m trying to get the recordings from after the gates opened too. I know there’s an archive of them at Alighar Muslim University, but I haven’t gotten an answer from them yet.”

“Something in particular you’re looking for?”

“Memories change over a few decades,” she said. “I just want to see if what he says here matches what he said then.”

“See if you can figure out why we aren’t all dead already?”

“I have a couple theories on that.”

He pushed himself across the room, grabbed a handhold, and settled at her side. Pale stubble dusted his cheek like light snowfall. She took his hand in her left, and pulled up the water purification data from San Esteban with her right. The efficiency graph wasn’t subtle.

“What am I looking at here?” he asked.

“An uptick in salt precipitates that matches when everyone died,” Elvi said. “It looks like the mechanism the dark gods figured out is to make ionic bonds just a tiny bit stickier. It lasted just long enough to shut down neurons. The local fauna are also using ionic channels for signal propagation even though it’s more like vacuum channels than nerves. It would still mess them up pretty good. You can tell it’s not taking out the microbiota, though.”

“How can I tell that?”

“Bloat,” she said. “The trapped gasses are microbe farts.”

“I find that story horrifying, but since it ended in a fart joke, I’m not sure how to react.”

“Not a joke, *but* as soon as the event was done? Water recycling started up again. And the *Amaterasu* transited in just a few hours after the event. All the decay in these images happened while they were getting to a landing pad.”

“Which says?”

“I don’t think the enemy knows it worked. Listen.” She found the tagged audio and played it.

It wasn’t like that. The systems just went dark. Like losing a comm channel.

Then how were they certain the systems were dead?

They were all connected.

She stopped it. “The builders didn’t go look. They didn’t have to. They were already connected. When they lost a system, they knew there was no one there anymore. They used the gates to shove matter around when they needed to, but that was like us moving food through our guts. It was barely even conscious for them anymore. It wasn’t something they scheduled or had trade routes for. So if there was nothing in a system to support, there’s no traffic to support it.”

“Traffic?”

“Like the *Amaratsu*,” she said. “The enemy did a thing, and then the traffic stopped. What if that’s how the enemy knew the thing worked. But with us? The traffic didn’t stop. I think we may be as hard for them to see and make sense of as they are for us. So part of what we can do is dirty up their data. All our random, uncoordinated transits are what they’re feeling. It’s like hearing rats in your walls and putting out different poisons until the noise stops. The noise stopping is how you know what worked. And since we’re still making transits in and out of that gate? As far as they know, their poison didn’t work.”

“That’s a hell of a theory.”

“Yep. Or.”

“Or?”

She popped to another audio mark. *It was just one at first.*

“Or this is inside the error bars for how they work, and they’ll be

murdering us all shortly.” She couldn’t keep the despair out of her voice. Even if she had, he would have heard it. They’d known each other too long for secrets. “We have to push harder for answers.”

“Harder than we have been?”

Elvi took her hand back and pressed her fingers into her eyes, rubbing from the center out to the sides. There was grit in her eyelashes. Tears that had dried there.

“I’ll talk to Cara,” Elvi said. “I’ll see if she’s up for it.”

“Talk to Xan too. He’s the one locked in the catalyst’s chamber for a zillion hours. And he doesn’t talk about it, but it’s freaking him out.”

We’re all fucking freaked out snapped to the front of Elvi’s mind, but she didn’t say it.

When Fayez spoke again, the careful cheerfulness was gone. He sounded worn and broken. He sounded more like she felt. He sounded real. “I’m not telling you what to do. It’s just...”

“Say it.”

“Cortázar kept them in a cage for decades. He ran tests on them with no concern for them.”

“I have Cara’s consent—”

“All these dives are changing her, and we don’t have a clear idea what the changes are. The fact that she enjoys it doesn’t reassure me at all.”

Elvi bristled, but it was Fayez and she was short on sleep and long on whatever adrenaline broke down into. Some kind of mandelic acid, she thought. She wasn’t sure. When he went on, she tried to listen and not just react.

“I know I’m not my sanest self right now. We’ve all been stuck on this ship for way too long, and everyone’s fraying, and it’s all scary as shit. I get that. I do. But that’s why we have ethical standards. So that when things get murky we have something to show us the way through.”

“And you think I’m violating ethical standards?”

“Yes. I love you, but yes you totally are. Absolutely.” He grimaced his apology.

Elvi took a long breath and let it out slowly through her nose. The *Falcon* hummed around them like it was also waiting for her to speak.

“I know,” she said, and it was actually a relief to say it out loud. “I am.”

“So what do we do about that?”

She crossed her arms. "Do you remember Dr. Negila?"

"That's a name from a long time ago. She taught at the University of Calabar?"

"I took an ethics seminar with her as part of my postdoctorate work. There was a story we read about this beautiful, utopic land where everything was wonderful and enlightened and pleasant and good and just, except for one child who had to live in confusion and misery. One child, in exchange for paradise to everyone else."

"I know that one. Omelas."

"This isn't that," Elvi said. "I'm working for an authoritarian dictator in a system where people are suffering and screwing each other over and killing each other. I'm compromising my safety and the safety of the people who work for me by smuggling my research to my boss's political enemies. We're not doing anything here to make a beautiful, gracious, pleasant utopia. If we win, the lives we save will be the same mix of shit, frustration, and absurdity that they've always been."

"True."

"The child in the story was being sacrificed for a *quality* of life. If I'm sacrificing Cara, and I acknowledge that I may be doing that, it's not for quality. It's for *quantity*. If I have to lose her in order to keep the quantity of human life from going to zero? It's cheap. If it costs everything, it's still a good trade."

It landed on Fayez. He lowered his head, not a surrender to gravity but a surrender all the same. "Yeah. Okay."

"If you can't do this, that's all right," Elvi said. "I can arrange transport back to the Science Directorate for you. You can do your work there as easily as you do it here."

"Sweetie. You know I'm not doing that."

"I'd understand if you did."

"Yeah, no. I just wanted to make sure we were doing what we meant to do. If doing the wrong thing is the right thing, then I'm still planning to wake up next to you while we do it. Kind of my life's work, really."

They floated together in silence for a moment, not touching.

"You should come to bed," Fayez said. "It's very late, and we're both very tired."

"In a little bit," Elvi said. "I have to make my report back to Trejo about

San Esteban, and Ochida is waiting for some resource reallocations based on the new plan moving forward.”

“Oh, and Dr. Lee wanted to talk to you too. If you have time. Personnel issue.”

Elvi nodded her query.

“I think there’s a dysfunctional love triangle in the physics group. They may need a talking-to from the boss.”

“Are you fucking kidding me?”

Fayez spread his hands. “Every miracle we’ve pulled off, we’ve done it using primates. Just because we’re capable of mind-blowing wonders doesn’t mean we aren’t still sex-and-murder machines. The organism doesn’t change.”

“All right. I’ll stop by the bridge. Do me a favor, though?”

“Anything.”

“The relief pod was supposed to have updated menus. See if the download taught the galley how to fake up some sag paneer?”

“If it did, I will have it waiting in the cabin.”

He pulled himself in and kissed her before heading out to the hall. She turned back to the San Esteban images. Now, every corpse she saw, she imagined as Fayez. Or herself. Or James Holden. Or Anton Trejo. Or Winston Duarte.

She started a recording. “Admiral Trejo. I understand that San Esteban is yet another first priority. All I can give you right now is our overview, some speculation, and my plan moving forward...”

It took half an hour to get the version she liked best, and she made a copy with a different routing header to send to Naomi and the underground. They were all allies in this, whether they knew it or not.

By the time she’d sent her reallocation plan to Ochida and talked to Harshaan Lee about how to keep the social drama on the *Falcon* from spiraling out of control, two hours had passed. Fayez was in their cabin, asleep. A tube of sag paneer was waiting for her, a bulb of decaffeinated tea beside it. She ate and drank and pulled herself into the sleeping harness.

When she dreamed, she dreamed she was in an ocean teeming with sharks, and if she moved too fast, they would kill her.

Cara floated in the lab while the technicians went through the adjustments to the sensor arrays on her skull like a cap. Everything was bustling around them, but Elvi felt like the two of them—she and her test subject—were still. The eye of the storm. On the screens, Cara’s brain function shifted and stuttered as the expert systems matched what they were seeing now to what they had seen before. “Norming,” it was called. As if norms were still a thing for them.

“How are you feeling?” Elvi asked.

Cara’s perfect black eyes clicked to her, went still for a moment, and then Cara grinned. Elvi wanted to see it as genuine, and maybe it was. Maybe the extra processing delta between stimulus and response only read as inauthentic and studied because Elvi was trying to read the girl as if she were the same as other people. As if she were a primate. *The organism doesn’t change*, Fayez said in her memory, but now it felt like a warning.

The organism *had* changed.

As if she’d heard her thinking, Cara’s expression shifted. “Are you worried about something?”

“I was thinking... about the cognitive changes you and Xan went through. Do you remember what it was like before?” Elvi asked.

“Before?”

One of the technicians touched the sensor leads, and the displays clicked over to green across the board. Good to go.

“Before the change. Before all this,” Elvi said. *Before you died*, she didn’t say.

“I don’t know. Just like anyone, I guess. It was a long time ago.”

Elvi forced a little smile, trying to think where she would have been when Cara had run into the wilderness of Laconia for the last time. Who had she been when Cara had been human?

“Long time for me too,” she said, then gathered herself. “Okay, we’re going to try something a little different this time. We need to refine the search. Try to get some specific answers about how the ring gates came to

be. We'll want to shift the BFE from lecture mode into more Q and A. If we can."

"Because of San Esteban?"

Elvi tried to think of some softer way to say yes, and failed. "Yes."

"I can try," Cara said. "I don't know if it'll like that, though."

"If you're uncomfortable or things feel wrong, say the word, and we will pull you back up. I'll be watching your stress levels. If they get bad, even if you can't speak, I'll call it. Okay?"

"I can take it," Cara said. "I want this."

Elvi took the girl's hand. It felt so thin and fragile. "Me too."

Interlude: The Dreamer

The dreamer falls purposefully into dream and dream and dream, swimmingly layer on layer on layer on the abyss. She is threefold, and one still missing, and the dream tells her about the unfolding across the emptiness and of the light of stars and cells and minds, the flicker that draws them like songs and kisses because their kisses were all light. The ones that don't feel the stars calling fall out of the dream, and the rest become wise and broad and fuller than the old ocean, comfortable in the vacuum with only their own slow heat to warm them.

Yes, the dreamer dreams like swimming with the tide, but the gates. How did the gates happen?

Grandmothers whisper in voices that have never known teeth. *Look here, I will tell you everything. Look here, to where the light becomes everything, look how the light learns to think.*

Yes and yes and yes, but the gates. The darkness. How did the *end* come?

Light itself fractures like an old woman holding out a glass bead, inviting a child's marveling eyes. *Look what light can do! Look how rich it can be! Isn't it prettyful and beautisome? And don't you want to eat it all up so it can eat you and expandingcontracting fullness of the bloom?*

But the gates. The gates. And the things at the end.

Grandmothers smile and smilingly nod, noddingly smile and the dream shifts like a kick in the face. The rich light diffracts, and there are holes in the spectrum. Infinite holes of more than darkness between the light that's more than light. The dreamer chokes. Reality splits her open like vomiting or orgasm or seizure and the grandmothers hold the glass bead that had her head in it and it wants to explode.

Is she okay? Do we pull her out?

Not yet.

A new physics falls into place all through the dream. Yes yes yes, the monkeys began with the parabolic arc of stone through air, and they learned everything in that order that isn't the dream or the dreamer, that's the one in blue. The light began swimmingly, with the caress of waters and salts, and its first chapter was different and its second a second difference and its fullness a different fullness, with fingernails in the cracks between this and the permanent outside.

The grandmothers say *look look look how it all happened once and all happens again*. The cold roof of the world broke open and gave the stars. The vacuum shatters in the same way and shows the outside, the *older* real, the *vaster* real.

The body of God. The heaven where the angels all hate us.

The dreamer feels herself shaking, feels herself losing bladder and bowel control. *Don't wake me up don't wake me don't wake don't*.

You wanted to know is I did and I do.

A new physics gives new problems and the problems ticklingly new dreams. A second crash outward, a new efflorescence, a vaster self. And the toolbox was the toolbox: co-opting fast life to bring what makes it rich, sending out what will or may one day return with presents for the grandmothers who cast them free, and the vast patience of the ones who are too cold and too slow and too wide to ever die, too sudden for time to touch. A bubble blown into the holes in the spectrum and a thousand thousand thousand seeds sent like kisses to the singing poet stars. And then...

The dreamer flickers. The body someplace starts to fail, and she feels something deeper than dream opening under her. All that begins will end, and the end is clearing its throat in the hallway. Bring me up. Bring me up bring me up *bring me up*.

What is this? the blue one says, and the dreamer pushes away, but it isn't her dream anymore. The grandmothers cackle and run, trailing her in their thousand fingers. And the echo says *Sorry. Didn't mean to drag you in here. Just try and relax*. But it isn't speaking to her.

A nucleus in a vast atom, and the burning clockwork at its heart. The power of a million suns harvested from the older universe. *Yes yes yes*, the blue one says. *I see now. Show me how this works*, and the grandmothers do.

She's seizing.

Pull her out.

And the blue one puts a gentle hand on her head and holds her lovingly underwater. A system goes dark, a few voices out of quadrillions go silent. A hundred systems. They go to war, and the war fails, but show me where you buried the guns. And the grandmothers gigglingly do.

Yes, the blue one says. *Yes. That's what I needed.*

Thank you.

Chapter Twenty-One: Tanaka

The girl on the screen wore something that was supposed to look like a uniform, held herself in a way that was supposed to look like military crispness, and spoke with a formality that was supposed to sound like authority.

“In accepting Admiral Trejo’s offer, I am willing to permit one envoy from your ship to enter Draper Station to take custody of Teresa Duarte,” Jillian Houston said. “Once this transfer is complete, both the *Sparrowhawk* and the *Derecho* are invited to retire from Freehold system until such time as the details of our new situation can be finalized.”

“Oh, goody,” Tanaka said. “We’ll be invited to retire.”

“Yes, sir,” Mugabo said. Then, a moment later, “She does seem a bit green.”

“She’s still licking off the caul. I can’t believe we’ve had this much trouble tracking down someone who’s still sleeping with her teddy bear.”

“I believe a Martian was in command of the *Storm* until shortly before the attack on the homeworld.”

“And Nagata was in charge during that,” Tanaka said, then tilted her head. “So why isn’t she the one answering now?”

“I don’t have a theory to venture,” Mugabo said, but she hadn’t really been talking to him anyway.

Trejo’s plan was bold, she’d give him that. And, like all the best plans, it was limber. If Nagata accepted the terms, then he’d let her playact at being in charge until he could rebuild the strength they’d lost. And if Duarte proved to be unmanageable, maybe even keep her on as figurehead in perpetuity. It was an elegant way to put an end to the fighting: Give the enemy the raiment of power while keeping the actual power for yourself and then seeing if she ever noticed.

If she didn’t agree, but did reach out to announce her rejection, the door

was open for diplomacy. Diplomacy always provided the chance to glean more information from the enemy. Or for them to glean it from you. It wasn't a form of conflict Tanaka found comfortable, but she understood it.

This situation, though, fell somewhere between the two. It was an acceptance, and allegedly by the underground, but not by Nagata. It was a negotiation of terms, but not about the larger issues. Tanaka had already learned more than a little critical information: the exact location of the underground's secret base and confirmation that the *Gathering Storm*—or at least its commander—was there. Teresa Duarte was probably there. The little rebel captain was certainly acting like she was. And it was probably true. The ship that had come through the gate was a good match for the *Rocinante* when it left New Egypt. It had gone to the moon that had the enemy base. And if the *Rocinante* was there, James Holden and Naomi Nagata were almost certainly there too.

If Nagata had been the one responding, it wouldn't have smelled wrong at all.

It smelled wrong.

"I'm taking it," she said. "I'll go get the girl."

If she'd expected Mugabo to object or push back against her taking the personal risk—*The last time you had a Marine fire team with you, and you still came within centimeters of death, sir*—he disappointed her. She didn't feel disappointed, though. More amused.

"Tell Botton to start the *Derecho* toward us," she said. "If we're leaving after this, it looks like good faith. If we're fighting, I want him close."

"Of course, ma'am," Mugabo said. "Not to change the subject, but you saw the briefing about San Esteban?"

"What about it?"

Mugabo's little smile was melancholy. He would have made a good waiter. He had the vaguely embarrassed expression crafted for telling people the special was already sold out. She met his eyes.

"There are other people on that mission. We're on mine. If the Messiah comes, He can find us at work. Understood?"

"Perfectly, sir."

"If you need me, I'll be in the armory."

She hadn't packed her fast scout suit, much to her regret. The *Sparrowhawk* did have a latest-generation assault suit, and lying on the

deck awaiting her finishing touches, it looked nothing like the elegant and greyhound-lean Stalker. The assault armor had the simple, brutally efficient design of a wearable murder-robot. Underslung on both arms were Gatling guns, designed to fire a high-speed stream of small-caliber explosive rounds. On the left shoulder was an integrated rocket-propelled grenade launcher, for when a pair of machine guns just won't get the job done. And the suit itself was a weapon. Wearing one, Tanaka could bench-press a ground vehicle. Ripping a human limb from limb while wearing a Laconian assault suit was trivial. It was made for door-to-door, corridor-by-corridor assault. It was the pinnacle of Laconian design engineering, and in her hands it could clear a base like Draper Station without assistance. As long as she didn't step in front of any PDCs.

She worked, slowly and methodically going through the mental checklist thousands of hours operating these suits had etched in her brain. As she finished the suit's final touches, her mind occupied itself with the upcoming fight. If it was a fight.

She was ready for it to be a fight.

Tanaka's tongue probed through the gap where her teeth used to be and across the nasty scar inside her cheek. The wound no longer hurt, but she could feel the uncanny smoothness of poorly healed gashes where James Holden's bullet had blown the side of her face apart. It itched, but not physically.

The physical wounds were bad. Her head still ached if she slept on it wrong. Even if she went through the trouble of a complete regrow, her cheeks would never quite match again. It was going to take months to grow back the missing bone, and more than that to regrow teeth from it. There were people—even people in the Laconian military—who had used less to claim permanent disability with increased retirement benefits. But that wasn't the worst.

The embarrassment was worst.

She was the peak of the Laconian military. The lone atom of steel at the tip of the tip of the spear. Experienced, trained, and still in top condition despite her age. She'd gone on what should have been a milk run with a full fire team at her back, and James Holden had handed her her ass on a plate. She understood why. She'd been restrained to protect the girl, and he hadn't. She'd been conservative with employing a warship around civilians,

and he hadn't. She could have waited until the girl had been dropped off, but even that had been a calculated risk that just bounced bad for her that time. Nothing she'd done would have raised an eyebrow from a review tribunal. But she'd lost, and he hadn't.

She loaded a belt of mixed high explosive and armor-piercing rounds into the right arm's gun. It made a satisfying metallic click when she locked and armed it. Don't kill anyone, or kill everyone.

If anything went south during the transfer, she knew which one she was picking.

Tanaka had Mugabo park the *Sparrowhawk* far enough from the moon that they'd have time to evade incoming rail-gun rounds, then used her assault suit's EVA jets to descend to the surface at the coordinates she'd been given. A shallow overhang in the rock and ice hid an airlock door from orbital view, but was plainly visible once she'd hit the surface. The outer door was open and waiting for her.

Draper Station wasn't much more than an icy cave sprayed with insulating foam on a tiny moon where the gravity was a meek suggestion of down. It had about as much in common with a naval base as it did with a Belter pirate station. The idea that a great warrior and leader like Admiral Trejo felt the need to negotiate with these low-rent revolutionaries left Tanaka feeling insulted on his behalf.

"I'm going in," she radioed up to Mugabo.

"Understood, sir," he said. "We are standing by."

Tanaka chuckled to herself and killed the channel. A few moments later she'd passed through the airlock and into a large equipment storage room. Lockers and vacuum suit racks filled all the wall space. The ceiling was covered with the same shitty spray-on insulation as the walls, but the floor was metal grate, so she kicked on her mag boots.

Five people waited for her in the room. They were all armed.

"I'm Jillian Houston," the woman in the middle said. She wore a simple

jumpsuit without rank markings. The four people flanking her held rifles like they were some kind of honor guard.

“Colonel Aliana Tanaka of the Laconian Marine Corps.” There were forms to be obeyed in a prisoner transfer, and until Tanaka had the girl in her hands, she’d obey them.

Jillian Houston seemed nonplussed when Tanaka didn’t continue. They shared an awkward silence. Jillian cleared her throat. Tanaka watched her HUD while the suit’s various heat-and-sound-imaging and radar sensors built a map of the interior of the station for her. The electromagnetic sensor that could pinpoint the location of human heartbeats also mapped the location of anyone within its range.

“Trejo said—”

“Fleet Admiral Anton Trejo,” Tanaka interjected, the assault suit’s external speakers making her voice echo off the walls.

Jillian’s expression hardened. She might be green, but she didn’t like being corrected. Even standing face-to-face with Tanaka’s battle suit, she wasn’t backing down at all. Only the elevation in her heart rate betrayed her nervousness. Scrappy.

Tanaka waited, watching the guards twitch. Jillian seemed determined to force Tanaka to speak first now. A power game. Fine. The suit reported that it had a mostly complete station map, and every human within seventy meters was pinpointed. Tanaka turned off the external speaker and said, “Free-fire authorization, Tanaka.”

The weapons of the suit clicked out of safe mode, a sound that also echoed around the room. The guards shot nervous looks at each other.

“Fleet Admiral Trejo,” Jillian Houston said, breaking first, “guaranteed us that if we gave you the girl, all Laconian forces would withdraw from the Freehold system without further attacks. We have his word on it.”

Tanaka chinned the external speakers back on. “I’m not seeing Teresa Duarte. Where is she?”

“Before I hand her over, I need more than vague assurances that you are acting in good faith.”

“Moving the goalposts?” Tanaka said.

“I need more than assurances,” the Houston girl repeated. Apparently they’d gotten to the end of her script.

“Where’s Nagata?”

“Excuse me?”

“The admiral made his offer to Naomi Nagata. You aren’t her. Teresa Duarte’s not here. What’s really going on?”

Houston lifted her chin like Tanaka had accused her of something. “Naomi Nagata is in operational control of the civilian action of the underground. As the commander of the *Gathering Storm*, military decisions fall to me—”

“Bullshit.”

“I don’t care for your tone of voice.”

This was the moment. Playing it safe hadn’t worked in New Egypt. Life was risk, and the fact that even if it all came down poorly, there could be no consequences for her personally was a little intoxicating.

She wasn’t going to shoot the Duarte girl. They weren’t likely to do it. The only danger was an accident, and even if the girl did take a bullet, there was a percentage of those wounds she could recover from.

And once the shooting started, they might try to evac the prisoner, in which case she had two ships ready to disable the enemy. Flushing Teresa out of the base was probably the safest way for her.

She realized she’d taken a long time responding. Jillian Houston’s heart rate was ticking up with her anxiety.

So this was it. Play nice with the enemy, or do the obvious thing.

“You know, we’ve got some of those suits,” Jillian said, pointing at her armor. “We aren’t wearing them as a sign of good faith.”

“Wouldn’t matter if you were.”

Fuck it.

“All right,” Tanaka said, locking eyes with each of her four guards in turn and using the touchpads in her gloves to target them. “I’ll just go get her myself.”

“No—” Jillian started.

Tanaka said, “Go loud.”

The left and right arms of her suit snapped up into firing position much faster and more accurately than if she’d been driving them manually. The second the weapons were lined up on the outer two guards, they fired a short five-round burst that blew their heads off. Her arms snapped to the second position and fired a second time. The two people standing next to Jillian Houston disappeared from the chin up. The entire process took less

than a second and a half.

Smoke filled the room, and the roar of the guns was still bouncing around the space when Jillian Houston spun on her heel and pushed off, flying down the corridor behind her. Tanaka watched her go. She could have turned the woman into a dancing bloody rag doll a hundred times over in the time it took for her to flee.

“Track her,” she told the suit, and Jillian Houston’s rapid heartbeat got a special tag on her HUD. If Houston was in charge of the base, she’d know exactly where the girl was. Teresa Duarte’s value as a hostage was the only thing that might keep any of them alive. In the meantime, Tanaka had other business she could do.

She used the suit’s mag boots to keep her secure to the floor as she casually strolled down the corridor following Houston. All around her the heartbeats of the station’s denizens were running around and speeding up as the panic spread. That was fine. It wasn’t like her plan relied on secrecy. Let the revolutionaries prepare. Let them arm up and dig in. None of it would matter. They could have the courageous last stand all the romantics craved. It would still be a last stand.

She moved into a corridor junction, and her suit blatted an alarm tone at her microseconds before a barrage of gunfire hit her on the left side. The suit marked three targets, all using light automatic weapons and hiding behind improvised cover. Tanaka tapped a pad in her glove and the left arm of the suit snapped around and fired three times. Three shredded bodies drifted out from behind their cover, spraying globes of arterial blood into the air.

The ammo counter for the left gun went down by another fifteen rounds. Tanaka noted this without concern. Full ammo packs on both guns. Plenty for everyone. And if not... Well, the alternative was messier but it had its charms.

“In New Egypt, we could have done this easy,” she said, imagining Nagata and Holden and their crew. “This is what *you* picked.” She smiled while she said it, the tightness in her wounded cheek pulling it into a lopsided grimace. It didn’t hurt much.

Corridor by corridor, meter by meter, Tanaka moved through the station. She headed toward the large clumps of heartbeats first. Hoping that the center of the largest resistance would be the heroes of the *Rocinante*, but it

never was. The resistance fighters were tenacious and brave, Tanaka would give them that. They came at her with little regard for their own safety, and some of the counterattacks had a real cunning to them. Though, given that her rampage had left little indication surrendering would lead to safety, she'd have been doing exactly the same thing in their situation. And everywhere she went, the seventy-meter range of her heartbeat detector found new pockets of people, hiding or preparing to fight. One by one, she went to them all, offering them amnesty if they put down their guns and turned over the girl. Not that she expected them to. Not that she'd necessarily stop shooting if they did.

Tanaka realized she'd lost track of Houston's heartbeat. It gave her a moment of pause, but only a moment. She was concentrating on the map layout in her HUD, looking for possible ship docking points, when she rounded the corner into the base's single largest pressurized room. A massive warehouse space, over a hundred meters on a side and a dozen meters high. The room was filled with racks of supplies and ship parts. The secret treasure trove of the revolutionary underground. All of it stolen from Laconia.

The suit warned her that three people were moving up behind her, and when she glanced at the warning it popped a rear view up on her screen. Three Belters were maneuvering what looked like a tool cart laden down with a massive compressed-gas tank. She was just starting to turn when one of the Belters hit the rear of the tank and it launched at her like a battering ram.

Oh, she thought as it picked her up off her feet, *an improvised missile*.

She only blacked out for a moment, but when she came to, her suit was blaring half a dozen alarms at her. She was embedded a good half meter into the foam-covered wall of the warehouse. The improvised missile oxygen tank was holding her upright, still pressed against her chest.

The suit warned her that it had lost secondary actuator control for her upper torso, and 30 percent of the reserve battery power before the system had rerouted to stop the leak. She also had four broken ribs and a dislocated left shoulder. She chinned the medical override and had the suit shoot her full of painkillers and amphetamines. She felt a surge that was almost like pride in her opponents. *Nice job, little bunnies. Good try.*

The three Belters were cautiously approaching. She hadn't moved since

their missile hit, and they were undoubtedly hoping it had finished the job. One of the three had a portable plasma torch in his hand. To cut her out of the suit and make sure, she guessed.

“RPG,” she said, locking her eyes on the middle man. The suit raised the launcher up over her shoulder and took aim. The three Belters only had a moment to register a look of surprise before a twenty-millimeter rocket-propelled grenade struck the man in the center and turned into a cloud of shrapnel that would kill anything within ten meters.

Some of the shrapnel sprayed across her breastplate and visor, with a sound inside the suit like hail hitting a metal roof. A half second later, the shrapnel was followed by a spray of blood and viscera.

“Motherfuckers,” Tanaka said, then used the right arm of her suit to shove the oxygen tank away from her chest. Its mass was significant, but the suit was up to the challenge, and a few moments later she was back on her own two feet, pain-free and jittery from the drug cocktail in her veins.

“I’ll make you a deal,” she yelled out, turning the suit’s speakers up so high that anyone in the warehouse space with her would probably suffer permanent hearing loss. “The person who brings me Teresa Duarte lives. They’re the only one who gets to walk out of this place in one piece. So if you have her, you’d better be the first to show up with the girl in your hands.

“Because everyone else here is going to die.”

Chapter Twenty-Two: Jillian

As soon as the Laconian stepped into the base, Jillian knew she'd fucked up. She tried to believe that it was just nerves, that the trade would go down as promised, but in her gut, she'd known.

She hunched down in the access channel, head low. Blood was wicking through the fabric of her shirt, making the cut along her ribs seem bigger than it was. In the distance, the Laconian's amplified voice echoed, but Jillian only made out a few of the words. *Duarte. First. Die.* She plucked her hand terminal out of her pocket with her left hand, thumbing through the options with the same crisis-calm she'd always prided herself on. Her impulse was to go take care of the prisoners herself. Instead, she opened the comm.

"Jillian?" Kamal said. Even though the connection was voice-only, she could picture his worried expression.

"I made a mistake," she said as she hit the atmospheric release. The hiss of air rushing into the corridor outside their rooms was loud enough to come through the comm. "The Laconian's wearing an assault suit. She may be tracking me."

"Are you okay?"

Jesus, but that was just like Kamal. Jillian had locked him in a cell, asserted her own authority over the civilian chain of command, invited the enemy into their base, and Kamal was worried if she was all right.

"I'm where I should be," she said. "Stupidity's supposed to hurt. Get your people to your ship and get out."

"Where can we get armed up? Can you get us—"

"Get your people and go, Kamal. You don't need guns to run like hell, and you need to run like hell. I'm giving you cover."

She heard other voices behind him—Nagata, Holden, the black-eyed monster, the girl. She could hear in the breathiness of Kamal's voice that

they were on the move. “There still a couple Laconian ships heading for us once we get out?”

“There are. One’s here, one’s coming.”

There was a pause. He might have been thinking. He might have been running. “All right.”

“Ping me when you’re launched. I’ll make this as easy for you as I can.” She dropped the connection and a section of the wall behind her blew apart. She’d been found.

Jillian put her head down and pushed off, half running, half skimming in the microgravity of the base. A volley of bullets tore through the air around her. If the Laconian had meant her to be dead, she’d be dead already. All the enemy wanted now was to keep her scared and moving. It was working.

The heat in her face was shame and hatred. Shame for herself, hatred for the enemy. And fear too, but she wasn’t going to feel that now. That was for later, if later came.

Jillian got to a T intersection, grabbing handholds and swinging her body around the corner in the direction that would take the enemy away from the path Kamal would be on. *Chase me*, Jillian thought. *Come on, you asshole. Come and get me.*

Draper Station was small, but it was home. Jillian could close her eyes and navigate the whole place like it was her childhood ranch. Her handheld was lighting up with alerts and errors, some from the station crew, some from the automated systems. Alarm was spreading through the base like adrenaline through a bloodstream. There had been a time less than an hour before when Jillian would have followed up on every one of them. Part of her dreaded that she’d have to go through them all later. A part of her knew better, but that was for later too.

Still on the run, she pulled up her saved comm groups and hit Live-send to the crew of the *Storm*. “Draper Station is being attacked from within. Prepare *Storm* for emergency launch in... five minutes.”

She didn’t wait for any replies.

Behind her, the Laconian was shouting something about Teresa Duarte, but all Jillian could hear was the joy in the vast electronic voice. Her own mind was already dancing ahead. Up two levels, and there was a tunnel that looped back around to the hangars. If she could stay far enough ahead, the curve of the tunnel itself would give her some protection from enemy

bullets. She reached the ladder up, hauled herself to the next level, and slammed the access door closed behind her. It was going to be about as useful as rice paper for stopping the enemy, but the point wasn't stopping the enemy. Just slowing her down. Getting a few extra seconds for Kamal and for herself.

Something seemed to distract the Laconian, because she fell behind for a moment. Jillian was almost all the way to the tunnel's far end before she heard the access door being blown aside and the impact of the mechanized armor pulling itself after her in a fast, even stutter. Jillian let herself down and then moved to the right. The passage to the *Storm's* airlock was two levels down, but Jillian couldn't wait for the lift. Still on the move, she hit the lift door override, and by the time she reached it, the shaft stood open. She dropped, but slowly. Gunfire came from behind her. Some fragment of Draper Station's security force making their stand. Some people Jillian knew and had been responsible for, dying because she'd let herself believe she could trade the Duarte girl so she wouldn't have to watch her planet burn. The mistakes you made at the high-stakes table were always the ones that cost the most, and Jillian had a lot of chips.

Two levels down, she kicked off the back wall and stumbled into the airlock corridor. The *Storm's* outer lock was already open and waiting, and Jillian hurtled into her ship and thumbed the doors closed. Down the corridor, the mechanical armor slammed into view. The *Storm's* outer doors began to slide closed, and the enemy let out a shout amplified by her suit until the sound was almost an assault.

An RPG launched toward her, and time seemed to slow. The dark body of the grenade with a brightness behind it like a ship and its drive plume. Jillian tried to step back, as if that could help. The doors hissed closed, and then rang like a gong. The skin of the *Gathering Storm* was probably the only thing on the station that the Laconian couldn't blow a hole through. Another quarter second, and the grenade would have detonated in Jillian's lap. But that was for later.

"Bridge, this is Captain Houston. Report."

As the inner airlock doors cycled open, Caspar's voice came over her hand terminal. "Drive's prepped, but we're missing some crew."

"They're too late. No way to get them in now. Is the *Rocinante* launched?"

“No, still in dock.”

Where the fuck are you, Kamal? she thought. Into her handheld she said, “Prep for launch.”

“Aye, Captain,” Caspar said, and she heard the fear in his tone.

When she reached the lift, she checked her security report. Eighteen high-priority alerts tracked the Laconian from where she’d first opened fire, and then through the base, time codes of broken doors and gunfire alerts marking the Laconian’s passage through space and time like a borehole chewed through wood. She tried to guess which way Kamal and his people would go. Another alert lit up, but it wasn’t automated. Station security asking her what the plan was. The tightness in her throat was that she didn’t know what to tell them. The base was compromised, and it was her fault. One prisoner for thousands of civilian lives had seemed like an obvious trade at the time, but it had brought her here. Dwelling on the postmortem of her error was for later.

“Kamal, report,” she said, and for a terrible half second thought he might not reply. Then the speaker ticked once, hissed, and his out-of-breath voice came gasping to her. “By the water tanks. Heading for the dock.”

“Get there and get out,” she said. “I’ll clear the path.”

Caspar was in his crash couch on the bridge when she reached it. Amanda Feil was strapping in at comms. Natasha Li had the gunner’s controls up, even though she was sitting at her usual station. All the other couches were empty. Jillian slung herself into her own. The one she’d taken when Draper left. For the very first time, the chair didn’t feel right. It suddenly felt much too large for her.

“Launch when ready,” she said. “Li, target the *Sparrowhawk* as soon as we’re clear of the dock.”

“Disable or destroy?”

“Kill the fuck out of them.”

The *Storm* shifted under her, tilting her crash couch and then pressing her into it as the ship left its home port for what Jillian understood in that moment would be the last time.

Behind her, Draper Station burned.

The funny thing was she didn’t even like Kamal. She never had. She’d always felt like his faux-folksy grandpa act had a hidden contempt for her and people like her. She still remembered when the *Rocinante* had come to

Freehold as a threat and taken her father away. Maybe on some level she'd never forgiven him for that. Or maybe she was just reaching for bullshit psychological justifications because she was ashamed of how things had worked out. Flip a coin, win a prize.

The *Storm* thumped twice as two torpedoes were ejected from the launcher. On Li's screen she could see the tiny dots that represented them speeding off toward a targeting diamond with the name *Sparrowhawk* floating next to it. The *Derecho* was the same class as the *Storm*, but with the advantage of recent repair and resupply and the knowledge and expertise of the people who'd built her. The *Sparrowhawk* was smaller, and it had taken some damage in New Egypt.

Jillian looked at the tactical map of Freehold system. The little solar disk on her display made the vastness seem comprehensible. That was an illusion, but a useful one. Here was the ring gate. Here were the ships that the underground had in-system—half a dozen rock hoppers and an ancient ice hauler, none of them ready for a full-scale battle. Here was the *Storm*.

There were the enemies, focusing in on Draper Station and on her, the indicators for her two homes—her base and her ship—still so close together they overlapped. She pressed her fingertips into her lips until it hurt a little. There was the planet and her family and everyone she'd grown up with that the fuckers had threatened to glass. Here were the planets of Freehold system that didn't sustain life.

Here was the problem that, if she solved, she could live, and if she couldn't, she would die.

"Status on the *Sparrowhawk*?" she said.

"Matching us. Shot down the first two torpedoes, now staying just out of effective range."

"Could you give me an evasion plan for the *Derecho*, please?" she asked, and saw Caspar and Feil exchange a look. They knew when she got polite, things were bad.

Caspar spoke, his voice steady. "If we break directly away and make the highest sustainable burn, their long-range missiles will be good to go in eighteen hours, fifteen minutes. Solutions drop quickly from there."

"What's the status from Draper Station?"

"They've gone dark, Captain," Feil said.

She felt Bobbie Draper beside her. Not a ghost or a spirit, but a memory.

The older woman's smirk that might have been to condemn Jillian's naive fuckup or God's sense of humor or both.

If the *Rocinante* didn't get out—if Kamal and Nagata and the rest of them died where they were—there were options. Assuming Trejo's bullshit emissary stayed alive, one of the ships would have to stop and pick her up. If it was the *Sparrowhawk*, that meant it had to break away and give the *Storm* a head start. If the *Derecho* went after Tanaka, that meant they intended to let the *Sparrowhawk* do the fighting. But that was one she thought she'd be able to win. She could escape.

Freehold, on the other hand, couldn't. If she killed their sister ship, would the *Derecho* chase her or turn back to punish the underground by leveling the colony? Could the underground's other ships run interference? If she could lure the destroyer into joint action against her and her scattered militia at the same time... Well, the ice hauler wouldn't make it, but it might give her enough of an edge to win that fight. And then it would be the *Storm* and whatever damage it had sustained against the one remaining Laconian ship...

"It's okay, Captain," Caspar said, and Jillian looked up at him. Her lip had gone numb where she'd been pushing at it without realizing. The pilot's face was meant to be consoling. "We understand. It's okay."

Jillian fought the urge to unstrap, walk over, and hit him. Or dress him down at least. Lash out somehow. If they lived through this, she would have a long and very unpleasant talk with him about morale and faith in her command, but that was for later. Now, things were happening.

"*Rocinante* has cleared Draper Station," Feil said. "They made it."

A third icon appeared on her display, stacked on top of Draper Station and the *Storm* like they all shared the same shirt.

"Get me a tightbeam," Jillian said.

Seconds later, Kamal was on her screen. Familiar as he was, she found herself caught by the small details of his face: the way his skin darkened at the eyelid, the whiteness of the stubble on his chin and neck, the laugh lines at his mouth. If he was frightened, he didn't show it.

"What's your status?" Jillian asked.

"We're all on the ship. The girl and her dog too. It was closer than I would have liked, but we made it."

"Injuries?"

“We’re good.”

The map of the system still on her screen rearranged itself without any of the designator icons moving. The *Rocinante* was only one more piece on the board, but it changed the logic behind everything. She saw the flaws in her plans and the stakes she was playing for. The despair felt almost like relief.

“All right,” Jillian said with a sigh. “Set your course for the ring gate. I’ll buy as much time as I can. Tell Nagata I’m sorry.”

“She’s right here, if—”

“No,” Jillian said. “You can do it for me.”

She dropped the connection, took a moment for a long, slow breath, then checked status. The *Derecho* was upping its burn, leaping after them now that Teresa Duarte was in play. The *Sparrowhawk* was shifting away too, ready to take another shot at the *Rocinante*. Get even. That made her target selection easy enough.

“Keep us between the *Sparrowhawk* and the *Rocinante*. As many gs as you need,” she said, and her voice was calm and steady. Caspar’s *copy that* was too. As the *Storm*—as her ship—shifted under her and her limbs grew heavy with the acceleration, she went on. “How does this affect the *Derecho*’s arrival?”

“Effective missile range will be two hours for the *Derecho* assuming it keeps its present course. Overshoot will put us behind them and out of range fifteen minutes after that unless we brake significantly or they do.”

“Overshoot won’t be an option,” she said. “We’re looking at direct engagement.”

She looked around the deck. There was no shock on their faces. They’d all known when they got on the ship that there wasn’t much chance of getting back off.

“Permission to lay down some PDC fire along their trajectory?”

“Save your powder, Li,” Jillian said. “We won’t end this with anything left in the magazines, but there’s no point starting until it’s starting time.”

“*Rocinante* has changed course for the ring,” Caspar said.

Jillian steeled herself and pushed up to standing. The extra half g left her a little light-headed for a second, but she adjusted. “I’ll be in my ready room,” she said. “If any of you have personal messages you want to send, this is the time.”

They saluted her as she made her way off the bridge. Her ready room wasn't much, but it was hers. She was sorry she wouldn't get to spend more time there. She pulled up the live tactical display—Draper Station, the *Storm*, and the *Rocinante* growing slowly farther apart as they laid on the acceleration. The enemy ship and her own converging. She remembered something her father had said when she was growing up about owning your mistakes, even the ones you couldn't fix. You did it because it was the adult thing to do.

She sent a message to the other forces in the system giving them permission to leave their present orbits and proceed according to their judgment, like a man leaving the gate open for his dogs before he went to war. She got a last shot of bourbon, but the idea of it was better than the taste.

Her ship hummed and strained, and the vast distances of Freehold narrowed. Her station chimed and Feil's voice came on.

"Tightbeam request from the *Sparrowhawk*," Feil said. "I can accept or refuse."

"Pass it over," Jillian said.

The man who appeared on her screen had a thin face and an almost comical mustache. He looked apologetic.

"This is Captain Mugabo of the *Sparrowhawk*."

"Houston of the *Gathering Storm*," Jillian said.

"You have no credible path to victory here, Captain. I am authorized to offer you and your crew honorable surrender. You will be prisoners, but you will be well treated. Send your remote operation codes and let us take control of the ship. We will see you and yours to safety."

Jillian cocked her head. Even with all she knew and had been through, some part of her still leapt at the hope. Just the way it had when Trejo had offered his trade. Owning your mistakes meant not making them twice.

"Thank you for that offer," she said. "But your colleague Tanaka? She has already made it clear what Laconian honor is worth."

"I can't speak to her actions, Captain, but I can assure you of mine. Even if you manage to destroy my ship, the *Derecho* will catch up with you. It is more than your match. I mean no insult. We are both aware of the situation. People like us have no room for illusions."

Jillian's smile felt like a knife. If she had to die, she was glad she was

taking this smarmy fuck down with her. “We have a few minutes still. You can send a message. I would let your superiors know that when Colonel Tanaka opened fire without provocation on Draper Station, she didn’t just kill us. She killed you too. I hope it was worth it.”

“Captain—”

She cut the connection, poured the last sips of unwanted bourbon onto the floor where no one and nothing would ever have to clean it, and stood to go back to the bridge.

She was all out of later.

OceanofPDF.com

Chapter Twenty-Three: Jim

The *Roci* burned hard, the crash couch pressing up from under him at an acceleration that made his eyes ache. The sting of the juice in his veins was cold and hot at the same time, and it left him smelling something astringent that wasn't actually there. His breath labored with the unaccustomed weight like a hand pressing against his breastbone, defying every inhalation. And it went on for hours.

It might go on for days.

There were breaks every now and then to let people get food or hit the head. When he'd been a young man in the navy, he'd been able to wolf down a meal, grab a bulb of coffee, and get in a hand of poker in the galley in the break between hard burns. He didn't try anymore. His stomach wasn't as forgiving as it had once been.

Jim drifted in and out of sleep as they fled, but he only fell halfway. Part of him was always waiting to hear the collision alarms from his screen and the deep chatter of the PDCs trying to knock out enemy missiles before he and most of the people he loved were killed by them. The physical stress and the fear were as familiar as an old, often-sung song. A hymn to the price of violence.

He and Naomi were on the ops deck, in couches next to each other. Alex, above them on the flight deck. Amos, Teresa, and Muskrat were all down in the machine shop, in theory ready to leap into action if something in the ship failed. And maybe that was true. Amos was still a hell of a mechanic. Teresa was young, smart, and she'd been training under him almost since they'd fled Laconia.

Still, he really hoped that nothing failed.

He'd lost track of how many hours they'd been speeding out toward the Freehold gate and how many meals he'd skipped in the rush between hard burns, when a message popped up on his screen. It took effort to focus on it.

It was from Alex: SAFE TO STOP RABBITING?

Jim shifted his hands on the old, familiar controls and pulled up the *Roci*'s tactical display. Freehold system was vast and empty. If the display had been to scale, none of the ships would have earned a pixel big enough to see, but he'd been making sense of the semi-abstract designs on the *Roci*'s interface for decades. He didn't have to translate any of it. The red acute triangle was a Laconian destroyer falling away behind them. It wasn't chasing. It was on a braking burn toward Draper Station. The white triangle was the corpse of the *Sparrowhawk*, receding from them, but only at the speed of the *Roci*'s escape run. And the green, blinking indicator was the debris field that had been the *Gathering Storm*—flagship of the underground's forces.

It was a simple enough map. There weren't enough ships or bases in Freehold to allow much subterfuge. He ran the math of transit times—how far ahead of the enemy they could be when they reached the ring gate if they kept to the present hard burn, how far ahead if they didn't, how much of a lead they would need to get through the ring space and into some other system unfollowed. He ran a ladar sweep of a couple light-minutes ahead of them all the same before he let himself come to the conclusion he'd wanted to reach as soon as he read the question.

LOOKS CLEAR. WE CAN SPARK IT UP AGAIN IF WE HAVE TO.

In response, the thrust gravity eased back to half a g, and Jim's spine cracked just above his sacrum as something slid back into place. He shifted carefully like he was waking from a long, restless sleep, and rolled to his side.

Naomi had already locked her couch and sat up. Her mouth was a thin, grim line. Her screen was an engineering report of the *Roci*'s core systems—reactor, recyclers, water tanks, missiles and PDCs, power. She went through it value by value, making sure that everything was where it should be, since their lives depended on the ship not failing. He wanted to reach out to her, take her hand in his, but that would have been for his comfort. She was already doing the thing that would make her feel better.

He opened a channel to the machine shop.

"How's it looking down there? Everything good?"

The eerie hesitation in Amos' voice had grown so familiar it was hardly

eerie anymore. “Looking solid, except the dog’s got a little limp in her hindquarters. We’re going to give her a couple minutes to walk it off. If that doesn’t do it, we might take her to med bay and pop a little steroid in her hip.”

“Okay.” He dropped the connection.

Naomi had shifted her screen to a playback of the battle. Of the death of the *Storm*. Its destruction of the *Sparrowhawk*. The doomed dive into the teeth of the approaching *Derecho*. He had to think Alex was watching it too and seeing something very different. He’d served on the *Storm* for years. He knew the people who’d just died on it. Jim watched it on Naomi’s screen, trying to think how everyone else would make sense of it. How he did.

The two Laconian destroyers hurtled at each other, flinging torpedoes and PDC rounds until the resulting explosions blocked everything from view. The *Derecho* reappeared first, still under thrust, but its hull showing many glowing scars from Jillian’s furious assault. Then, when the *Storm*’s broken hull finally spun out the other side of the blinding cloud of violence, Jim heaved a sigh. It was the death of the underground, captured in low-resolution video. A glorious, ferocious death. But death all the same.

“Goodbye, Jillian,” Naomi said, whispering it like a prayer.

“We collect the most astonishingly brave people, don’t we?” Jim said. “And then we watch them die.”

Naomi smoothed her hair back and looked at him. “I thought Trejo was a man of his word.”

“He is,” Jim said. “I mean, he’s perfectly willing to commit atrocities. He’s not the good guys. But what happened back there, that wasn’t him.”

“And it happened anyway.” She bit the words as she spoke them.

“I was pretty sure I killed Tanaka back on New Egypt. This has the feel of a vendetta now.”

“So maybe he’s having as much trouble controlling his people as I am?” Naomi said, and went on before he could answer. “Jillian’s big heroic death screwed us. We’re fucked now.”

Jim flinched a little, imagining how the words would carry up to Alex. “She made a bad call. I mean, I understand the mistake. I’ve been known to act on my own judgment from time to time.”

He waited a few seconds before he went on.

“And when she saw what the situation really was, she saved us. She died

saving us.”

“She lost us Draper Station,” Naomi said. “The minute she talked to Laconia, she lost us the base. Even if they’d made the deal, they were never going to politely decide to forget we had resources on that moon. They weren’t going to pretend not to know the *Storm* was in Freehold system.”

“They were going to bomb the cities. People she knows and loves. Her family.”

“They’re the enemy army,” Naomi said. “Do we just do what we’re instructed every time they tell us that they’re going to do what enemy armies do? If that’s the plan, we’ve been running down the wrong road for a long, long time.”

“That’s not what I’m saying.”

“That we should have handed Teresa over? That we were wrong?”

“It’s not Jillian’s fault there was no good answer.” Naomi’s almost subliminal flinch at his words told him the rest. When he went on, he was gentler. “And it’s not your fault either.”

The flicker of her eyes was a conversation in itself: grief and exhaustion and despair, and also determination. The knowledge that they’d been playing the game of no-right-answer for decades, and that it would outlast them, the way history outlasted everyone.

That that was the best case.

Alex’s slow footsteps came from above them, then down the ladder. Jim had known the pilot for more years than he hadn’t, and he’d seen Alex in every mood from exultation to rage. He’d never seen him look so quietly, profoundly defeated. He’d grown a white wash of stubble on his cheeks since they’d started the run from Freehold. It reminded Jim of snow.

Alex lowered himself into one of the remaining crash couches and turned it so he could look at the two of them. They didn’t ask how he was, but he answered anyway. Just a shrug and a sigh and a turning to the next issue.

“Technically, we’re not at the ideal escape radius. If the destroyer did the hardest possible burn starting right now, it could be a squeeze getting out the Freehold gate and through another one in time to keep them from seeing where we went.”

“They’ll have wounded crew,” Naomi said. “They likely have some structural damage. And they’re still picking up Tanaka from Draper

Station.”

“I don’t think they’ll do it, either. And if they tried, we could make them work for it anyway. Jillian topped up all our tanks. But I’d rather push a little less hard and conserve reaction mass for later.”

He didn’t say *I don’t know when we’ll be able to fuel up again*. He didn’t need to. He also didn’t ask where they were going or what the next plan was. The three of them sat together, the *Roci* ringing like a feather-rubbed gong, the musical whisper of a good ship. Jim didn’t know exactly what they were waiting for, except that the silence seemed right. When Alex spoke again, his voice was thicker.

“Bobbie always said Jillian needed watching. She liked getting her own way a little too much. Wasn’t just independence. She was independent, but she was a little mean too. You know?”

“Like her father,” Naomi said.

“She was smarter than her dad,” Alex said. “She’d have been a good captain if she’d had a few more years doing it. And the *Storm* was a good ship. Second best I’ve been on.”

“Really?” Jim said.

Alex shook his head. “No, it was creepy. Laconian ships all feel creepy. But I just watched a bunch of my friends die, so I’m feeling nostalgic.”

The comm channel opened before Jim could reply, and Teresa’s voice—punctuated by sharp, alarmed barking from her dog—interrupted them. “I’m in the med bay. I need help. He’s having another seizure.”

The medical systems did the best they could with Amos, which was mostly the expert system version of shrugging and saying *Looks weird all the same ways he usually looks weird*. Amos lay in the autodoc, his head resting on the little pale cushion. The utter blackness made his gaze hard to track, but Jim was pretty sure the mechanic was looking at him.

“How long was I out?”

“About half an hour,” Jim said. “How are you feeling?”

“Might skip my workout. This shit’s tiring.”

“It’s happening more often, isn’t it?”

“Nope.”

“Because it seems like it’s happening more often.”

“Well, yeah it is. But not because anything’s going bad. The doc’s pushing harder.”

Jim looked at the autdoc, confused. Amos shook his head.

“Okoye. She’s running on full burn trying to make sense of things out at Adro, and since all of us with—” He pointed to his eyes. “We’re all connected at the back. I get the spillover.”

“Really?”

“Pretty sure. Every time I get the wiggles, I come back up knowing more.”

“Like what?”

“Nothing useful,” Amos said. “There’s holes in the spectrum where the idea of being in a place breaks down. And there’s a kind of light that can think. I mean, it’s interesting I guess, but it doesn’t get the tools stowed.”

“Can you tell if she’s making progress?”

“It’s not like it’s a tightbeam. We don’t talk about stuff,” Amos said, then frowned. “Not exactly, anyway. More like I’m listening to someone doing shit in the next cabin over. And... You know how it is when there’s people in the room with you, and even if you’re not looking at them, you still know they’re there? It’s like that. There’s always three of us.”

“The girl and her brother,” Jim said.

“Not sure about that, but there’s three of us. I know it’s a pain in the ass with me getting messed up like this, but I don’t think there’s much I can do about it. I mean, besides train Tiny so she can cover for me.”

Jim was about to say *I’m not sure I want a sixteen-year-old mechanic in charge of keeping us alive* when a happy bark sounded from the hallway. A moment later, Muskrat and Teresa came in. The girl was carrying a tube from the galley in one hand and a drinking bulb in the other. Her hair was pulled back in a tight bun that wouldn’t get in her eyes when they went on the float. Her mag boots were turned off, but she was wearing them. The dog was grinning and wagging her tail in a wide circle.

“Feeling better?” Teresa asked.

Jim was astonished by her casual, matter-of-fact manner. Even though

he'd been crewed up with her for almost a year, some part of his mind wouldn't let go of the memory of her as she'd been when he first met her on Laconia: a too-serious child with the weight of the empire on her shoulders, but still a child. She was old enough now to take long-term apprenticeship contracts, old enough to claim emancipation and her own rights on basic if she'd lived on Earth, old enough to see her only friend in the world suffer a massive seizure and take it in stride.

"I'm working my way back up," Amos said.

"I got you white kibble and lemonade. Salt, sugar, and water. I figured, you know, electrolytes."

Jim's stomach shifted at the thought of food, and he wasn't sure if it was hunger or nausea or a little of both.

"Thanks," Amos said, holding out his hand. She slapped the tube smartly into his palm like she was giving him a tool. "You take the stress inventory?"

"It's where I'm headed now," she said, then turned toward Jim for the first time, met his gaze, and nodded before she left. Muskrat pushed over, demanding a scratch behind the ears from both Jim and Amos before trotting back after Teresa. If the old dog was having hip trouble after the hard burn cycles, Jim couldn't see it.

"What's on your mind, Cap?"

"Thinking what it would be like to be sixteen and important enough that people kill each other over you."

"Yeah. It's gonna fuck her up," Amos agreed, amiably. "We did the only thing we could, though."

"Keeping her?"

"Yeah."

"I know," Jim said with a sigh. "It's going to be a problem, though. I don't see Tanaka giving up."

"She reminds me of Bobbie," Amos said as if he was agreeing.

"Naomi is wondering if Trejo was always going to double-cross us."

"You don't?" Amos sucked at the tube of kibble and nodded for Jim to go on.

"I've never known Trejo to lie. I've never known Duarte to lie either, and he was the personality that set the tone for all of this. He was grandiose. He was ruthless. He was a genius at a couple of things and under the

misapprehension that it meant he was smart about everything. But in his mind, he was doing the right thing.”

“The kind of guy, he’d feed you into a wood chipper, but he wouldn’t stiff you for his half of the bar tab,” Amos said. “I’ve known folks like that.”

“This Colonel Tanaka? I think she’s pissed off that she didn’t get us at New Egypt. Also, that I shot her in the face.”

“Yeah,” Amos agreed. “That’ll do it.”

“Think she’ll cool it if I explain I was just trying to kill her?”

“Seems like the right tentacle ain’t keeping track of what the left tentacle’s up to,” Amos said. “High command wants more than one thing, and running a galactic empire’s hard work. Maybe you’re right about Trejo. Maybe Tanaka just let it get personal and fucked up.”

They were silent for a long moment, then Jim sighed again. “The thing with hunting dogs is that once you let them off the leash, you’ve let them off the leash. They don’t stop until they catch what they’re going after.”

Amos went quiet for a moment, and Jim couldn’t tell if he was thinking or in one of his uncanny pauses. When he moved, it was like he turned back on.

“When I was back on Earth, I didn’t run with a hunting-dog kind of crowd,” Amos finally said. “But there was this guy I knew growing up who used to train police dogs. That’s kind of the same thing, isn’t it?”

“I don’t know,” Jim said. “Maybe.”

“So this guy, he was pretty fucked up by the time I knew him. Addicted to a bunch of different stuff, and taking a long time dying from it, but he still liked the dogs. The thing he said was that the whole process was about trying to find which ones weren’t going to start fucking people up on their own recognizance. So he’d flunk out any of the puppies that didn’t train up right, and he’d spend a lot of time working with the ones that made the cut. Fucking well-trained, smart animals, but that was the problem too. You get a dog smart enough, they know when it’s a training exercise and when it’s not. He used to say that until you went in the field, you never really knew what kind of dog you had.”

“So you think Tanaka’s going to stay on us until she gets what she’s after.”

“Or we manage to kill her,” Amos said. “Not sure it makes much

difference in the big picture.”

“I can’t see how this all plays out.”

“Sure you do. Everyone dies. That’s always been how it is. Only question now is whether we can find some way to not all go at once.”

“If we do, then civilization dies. Everything humanity has ever done goes away.”

“Well, at least there won’t be anyone who misses it,” Amos said, and sighed. “You’re overthinking this, Cap’n. You got now and you got the second your lights go out. Meantime is the only time there is. All that matters is what we do during it.”

“I just want to go out knowing that things will be okay without me. That it all keeps going.”

“That you’re not the one who dropped the ball.”

“Yeah.”

“Or maybe,” Amos said, “you’re not that important and it ain’t up to you to fix the universe?”

“You always know how to cheer me up.”

Chapter Twenty-Four: The Lighthouse and the Keeper

Tanaka almost hadn't gone into active service. There had been a point when she was sixteen years old and the star student of her cohort in the Imahara Institute's upper university program when she'd seriously considered committing to a career as an art historian. She'd taken three tutorials and courses, and she'd been good at it. Knowing the history surrounding an image made both the art and the history more interesting.

One of her last essays had been about a painting by Fernanda Daté called *The Education of the Third Miko*. It had been of a thin woman looking directly out at the viewer. The oil paint that Daté used had given an eerie impression of direct eye contact. The figure had been seated on a throne of skulls, and a single pale tear streaked her left cheek. Tanaka had written about the context for the image in Daté's life—the nonresponsive cancer that the artist was struggling with when the painting was made, the threat of war between Earth and Mars that she'd grown up with, and her admiration for the Shintofascist philosophies of Umoja Gui. The distress of the third Miko depicted the aftermath of her self-revelation and acceptance of her own compromised nature.

Tanaka hadn't thought about that painting in decades, or about what a very different life she would have lived if she'd made a few different decisions at the start.

The captain of the *Derecho* was a gaunt man named Botton. The ship shuddered under them, and the high-g burn made her a little light-headed. But she wasn't getting in a crash couch yet, and so neither was he.

"If we are not sincerely trying to catch the enemy..." Botton said, and then lost his train of thought. Not enough blood to the brain.

She waited to reply until he came back to himself. "We won't catch

them before they transit the ring. We won't catch them before they transit *out* of the ring space either. We are setting their expectations as to our speed of pursuit to maximize the time they feel comfortable staying in the ring space. Once they've gone through the Freehold gate, we'll accelerate to an even higher burn. Near the maximum the ship can handle. Our aim is to reach the ring space before their drive plume has fully dissipated. That's how we'll determine which gate they escaped through."

"If we could... slow our present approach..."

"It would mean a harder burn later."

Botton started to nod, but thought better of it. Standing free in a hard burn meant keeping the spine very carefully stacked. Tanaka suppressed a smile.

"My concern, Colonel," Botton said, "is that the supply of high-g drugs may not me... may not *be* sufficient."

She pulled up the allocation chart that showed the reservoirs of juice for the crew. While Botton watched, she dropped her own to zero. The pull of thrust gravity made his distress look like a sorrowful dog's.

"I wouldn't ask anyone to take a risk I won't take myself," she said. It wasn't true, but it made her point. She was stronger than him, better than him, and tired of hearing him whine.

"Yes, Colonel," he said. He braced, turned, and walked out of the office that had been his, careful to place his weight so that it wouldn't blow out his knees. Tanaka waited until he was gone before she let herself ease back into her crash couch. Or her throne of skulls.

The *Forgiveness* began its life as a colony ship built at Pallas-Tycho in the years when the Transport Union had ruled the ring gates. With almost two billion square meters of cargo space, and living quarters that were the same size as an in-system shuttle, the *Forgiveness* was about freight, not passengers. Ekko had signed on when he was fifteen, and apart from a year he'd stayed behind on Firdaws to work on his command certification, he'd

pretty much been there ever since. His stint as captain had outlived the union that had certified him. It had outlasted the traffic control authority on Medina Station. It had outlasted the iron fist of the Laconian Empire, more or less.

The major shareholder in the *Forgiveness*, on the other hand, seemed like she'd be plaguing Ekko until the day he died. Mallia Currán had financed the ship's overhaul with a private loan backed by the governing council, and while she didn't have a greater than 50 percent stake in the ship, she could get a coalition that did by making two calls and a coffee date. And she was Komi Tuan's niece, so anything semilegal she did was played down by the magistrates. Like the old gods of Earth, most of the time she ignored Ekko and the *Forgiveness*, and the days she didn't were almost always bad ones. She'd asked for a status report five hours before, and he'd been thinking about how to answer ever since.

He arranged himself in his office, checked his image on the screen, and started recording.

"Always good to hear from you, Magistra Currán. Everything's five by five with the ship. We have a full load of ore and samples for Bara Gaon, and I've had assurance that the return cargo is going to be ready when we get there. We're just waiting on the passage protocol before we make transit." He tried an insouciant smile, but it came off forced. "You know how it is with taking large cargoes through. Want to make sure we're doing it by the book and all. I will check back as soon as we have confirmation."

He saved the message and sent it before he could second-guess himself. Four hours back to Firdaws, and maybe it would reach her while she was sleeping. That would give him a few more hours before she worked herself up into an excoriating mood. Which she would.

He already knew the arguments she'd make: The underground's protocols were guidelines, not law; the infrastructure to support them was only partly in place; what the fuck was he going to do if the okay didn't come through? Just sit there on the float waiting for consensus flight permissions while someone else bribed the supply officers in Bara Gaon for the soil and fuel pellets and fabrication printers that Firdaws needed?

She wasn't all the way wrong, either. A cargo ship that didn't move cargo wasn't much of anything.

"Fuck," he said to nothing in particular and everything in general. He

opened a channel to the pilot's station two decks below. "Annamarie? You there?"

"Am," his pilot said.

"Give us a quarter g toward the gate, yeah? We're going to have to do this, clearance or no clearance."

"Understood. On it," she said, and dropped the connection. A few seconds later, the thrust correction warning went on. If no one answered him, he'd have to decide whether to put on a braking burn or pass through the gate without clearance, knowing that there was an armada of independent freighters out there making the same calculations as him.

But what the hell, really. Life was risk.

"She's getting pretty close," Jim said. "We're sure about this?"

"We can keep ahead of her," Alex said from the comms and the deck above. "She knows it. If she gets too close, we'll speed up, then she'd have to speed up. Or we'll decide to make a break for it, and she'll know how close we're willing to let her get. Right now, she's willing to dump reaction mass and I'm not. If that changes, it'll change."

"You sound very philosophical about it."

He could hear the smile in Alex's voice. "I've always admired this part. Don't much care for the killing each other at the end, but there's a poetry to this part of the conversation. And there are some decisions we're going to need to make."

Jim turned his head. Naomi was already looking at him. Teresa and Amos were on the comms from the machine shop.

"Nuriel system is only a ten-degree deflection from our present course," Naomi said. "We wouldn't need a braking burn. It has some underground resources."

"But Tanaka would know we didn't need a braking burn," Alex said. "We could pop through the ring space from one end to the other in a few minutes if I get the angle right, but it'll be like drawing an arrow to where

we went. Going in slower means we have a wider range of systems that we might have headed into.”

The ship hummed and rang, the resonances of the drive playing their long, familiar music. On his screen, the Laconian destroyer ticked forward, closing the distance between them. The intercept would still come well after they’d passed through the ring gate and out through some other one. The panic clearing its throat in the back of Jim’s head wasn’t based in anything but itself.

“We also don’t want to go through so fast we ditch ourselves,” he said, more thinking aloud than to tell the others something they hadn’t already thought. “And there might be other Laconian ships in the slow zone. We can’t be sure there aren’t.”

“I don’t know how to control for that,” Naomi said. “But we can aim for the systems where there are likely to be fewer eyes on us. It’s the best we can manage.”

There were so many risks. If Laconia had a spotter ship in place, they’d be found. If the enemy was watching from the sunward side of whatever gate they passed through, the way the *Derecho* had in Freehold, they’d be caught. If Tanaka, breathing down their necks, had some trick he hadn’t thought of, they’d be caught. If they made the transit too fast or with too many other ships, they’d be dead. If they stayed too long in the slow zone and the things inside the gate boiled out from beyond the ring space again, they’d be dead. And if it all worked out... then what? Dead or captured were the failure states. He wasn’t sure what success looked like.

The next step, maybe. It didn’t matter if he knew how it all ended, as long as he always knew what was next. *You can drive a thousand clicks if you’ve got one good headlight*. Mother Elise used to say that when he was a kid. He hadn’t thought of her in a long time. Having her voice come to him so clearly right now felt like an omen, but he didn’t know what of.

“Cap?” Amos said.

“Yeah?”

“We need to go see the doc.”

He was quiet for a second. “Adro system?”

“The only ships there will be Laconian,” Naomi said.

Teresa answered. “But they’ll all answer to Dr. Okoye. And there’s nothing else there. Colonel Tanaka won’t expect it.”

“We did just gas up,” Alex said. “If we’re going someplace for a long, quiet float, this is the time for it.”

“Cap,” Amos said again. There was something in his voice. “We need to go see the doc.”

Jim didn’t want to do it, and he wasn’t sure why he didn’t want to. No. That wasn’t true. Elvi was their last hope against the darkness, and if he saw that she’d failed, he wouldn’t even have that anymore. It wasn’t a good enough reason to stay away.

“Alex, plot the fastest transit you can for Adro system.”

Kit woke. The harness beside him was empty. At first he thought Rohi was feeding Bakari, but that wasn’t it. The baby was in his own little sleeping harness, eyes closed and arms floating forward like he’d never left the amniotic sac. His son looked utterly at peace. Which, good on him, because nobody else was.

As quietly as he could, Kit undid his restraints and synced his handheld with the cabin’s system. It would keep its electronic eyes on Bakari and alert him if the baby so much as burped. Then as near to silent as he could be, he slipped out of the cabin and into the common galley.

The lights were dimmed to night mode, so Rohi’s handheld lit her face from below. The flag of their future home was a shadow over her right shoulder. Her eyes were fixed on the little screen, and her expression was empty. He didn’t need to ask. He knew what she was looking at. Footage from San Esteban system.

He pulled himself to a stop beside her, his magnetic boots off and floating in air. She glanced up at him, made a rueful smile. Rueful and maybe a little resentful.

“We’re almost at the gate,” Kit said. “A few more hours.”

Rohi nodded, but the feed on her handheld cut to something new, and it held her gaze. The horrors of a systemful of dead people, replayed again and again, with commentary in ten languages and a hundred political

orthodoxies. The science feeds about the manner of death. The religious feeds about its spiritual meaning and what it said about the will of God. The political feeds about why it was some other ideology's fault. She watched all of them like she was looking for something in the images of the corpses. Meaning, maybe. Or hope.

"You should get some sleep," Kit said. "Baby's going to be up before long, and he's not as impressed with me as he is with you."

"He doesn't see there's anything wrong with you," Rohi said. "He's a baby, and he already knows I'm stressed."

"Between the two of us, we are his universe."

"What if we aren't supposed to do this?"

"Do what, babe?"

"All of this? Going to other planets. Going to other stars. What if God didn't want this?"

"Well, then they should have spoken up sooner, I guess. It's late in the game to turn around."

She chuckled and shut off the handheld. He was relieved. He didn't know what he'd have done if she refused to look away from the feeds. Go back to the cabin by himself, probably.

"How do we do this?" she murmured. "They all just died, and everyone just keeps doing what they were doing anyway."

"No options. We go on because we go on." He wiped away the film of tears building up around her eye. "It'll be all right," he said, hearing how little weight the words carried. How little he believed them. "Come to bed."

In one way, the chase looked simple. The *Roci* was braking, still hurtling toward the Freehold gate but more and more slowly. By the time it passed through, it would be going slow enough that it could deflect its flight path the thirty-four degrees it took to slide out the Adro gate, or any of hundreds of others. The Laconian destroyer *Derecho* had a greater velocity and was only now starting to brake. It would slide through Freehold gate moving

faster, braking harder, running its high-powered Laconian drive hot enough to risk the deaths of some percentage of its crew. Maybe it would be able to find the gate the *Roci* had gone through. Maybe it would guess wrong. Maybe it would make a killing burn to shed all its velocity and come to a stop in the ring space so it could search for traces of the *Roci*'s passage. Or, hell, maybe it would malfunction, spin off into the non-surface of the bubble between the ring gates, and be annihilated. Jim had been lucky before.

In another way, the chase was impossibly complex. With a flick of his eyes, he could turn the display to a probabilistic three-dimensional map that showed all the possible flight paths the *Roci* could take, the complex decision points where an equation with values like time, vector, delta-v, the elasticity of a human blood vessel, and the ship's position in space defined the moment when a possible future slipped away. Jim moved between the two views—the curve of the *Roci*'s intended path and the swooping, lily-shaped cone that was the *Derecho*'s possible paths. Then over to the intricate web of things that could happen but hadn't yet, as it narrowed second by second and left a thin thread called history behind it. His jaw ached from the deceleration. No one had spoken for hours, and his headache was probably just a headache. Strokes didn't take that long.

PREPARING FOR TRANSIT Alex messaged the full crew. On the external telescopes, the thousand-kilometer diameter of the gate was still almost too small to see. Jim watched it grow slowly until it was almost as big as the nail of his outstretched thumb, and then all the stars in the universe snapped off at once as they passed through it and into the ring space.

The whole bubble with all the gates was a little smaller than the volume of Sol system's star. A million Earths wouldn't have filled it. At their speed, they wouldn't be inside it for very long.

The *Roci* shifted under him, slewing around in a perfect arc, connecting the Freehold gate and the Adro gate in a logical relationship defined by complex math that the enormous power of the ship's drive was struggling to convert into physical reality. If the feed of reaction mass stuttered, they'd slip off course. If they missed the Adro gate, everything that came after that would be someone else's problem. Jim couldn't tell if his heart was racing from fear or just the effort of keeping the blood supply going to his brain.

To his left, Naomi grunted, and it sounded like dismay. He had the sudden flashbulb memory of medical alarms blaring when Fred Johnson had died in the same crash couch she was in, and his heart found a way to beat a little faster. No alarm sounded, but a private message came onto his screen from her.

TOO MANY SHIPS.

He changed his display again. The traffic pattern in the ring space. A dozen transponder codes spooled out—*Tyrant's Folly* out of Sol, *Taif* out of Hongdae, *Forgiveness* out of Firdaws—and twice as many pings for unidentified drive plumes. He tried to shift the analysis to include them all, but before he could, another message came from Naomi.

THIS IS INSANE. THEY'LL FAIL THE TRANSIT. WHAT DO THEY THINK THEY'RE DOING???

But she knew what they were doing. The same thing they were. Looking at the risk, and each one individually deciding that it made sense for them to throw the dice. And some had certainly failed. There was no one to keep track of how many ships went in a ring gate and didn't come out the other side. If the *Roci* was lost, he didn't know how long it would be before anyone realized it. Maybe never.

He shifted the system to threat assessment, and the answer came at once. Two ships were going to transit out of the ring space before the *Roci* reached Adro: a colony ship running without a transponder that was almost at the Behrenhold gate and the *Forgiveness*, a massive cargo hauler out of Firdaws that would pass into Bara Gaon just a few minutes before the *Roci* reached the Adro gate. Assuming the rings were at base state, the *Roci* would survive the transition. Assuming that no other ships came in through a ring gate in the meantime.

Assuming, that was to say, a lot of things he didn't have any reason to assume.

The stars came back. The same stars as home, if in a slightly different

configuration. Ekko let his head fall back into the gel of the crash couch. For a moment, he didn't say anything, barely felt anything, and then a deep relief rode through him like a wave, lifting his heart and setting him back down laughing.

He became aware that his comms were open from the soft rhythm of Annamarie cursing in French. She wasn't talking to him or anyone really. Maybe God.

"Little full in there today, yeah?" Ekko said.

Annamarie shifted to English. "*Fuck*, that was too much, old man."

Ekko laughed again. The release felt almost postcoital. Here he was, in his ship and in Bara Gaon system, and not in whatever screaming void ate ships that drew the short straw.

"I'm going to quit," Annamarie said. "I'm going to find an apartment in Bara Gaon and an honest job, and I'm going to retire and have babies and never go through that fucking gate again. *God damn*." He could hear the grin in her voice, and knew she didn't mean it until she sobered. "Seriously, capitán. Someone's going to fucking die in there if it stays that busy."

"True enough, but not us. Not today. Get me a tightbeam lock to the traffic authority and the client. Let them know we're here."

"That we live to skin our asses off another day," Annamarie said. "On it. I will let you know when I get the lock."

The *Rocinante* screamed. Compression seams touched the inside edge of their tolerances. Massive hull plates of carbon-silicate lace settled deep into their supports. The drive howled and pushed up against the hurtling bubble of ceramic and metal and air. The writhing stars on the far side of Adro gate loomed up, almost hidden behind their drive plume.

This was an absurd way to die, Jim thought.

His jaw hurt and he kept losing little bits of time. Alex had the drive plume of the *Roci* pointed out toward the Adro gate, bleeding off as much speed as they could, making their transit a few seconds later in the

unmeasurable hope that it would make the difference. Across the ring space, the *Derecho* would be coming close. There were so many ways for all of it to go wrong, and then what?

Mother Elise's little boy would have arced up from Montana through wars and alien solar systems and love and despair and died slamming into the one danger he'd known for decades was right fucking there. It was too stupid to even qualify as irony.

A message appeared on his screen from Naomi—ARE YOU OKAY?—and he had to keep himself from turning to look at her. He wasn't sure he'd be able to turn back under this burn. The blood was pooling in the back of his skull, and the uncomfortable electric fizz of the juice was, he was sure, the only thing keeping him from having several strokes at once. He started to answer her, then forgot what he was doing. The gate approached, growing larger first slowly, then quickly, then all at once.

The burn started to trail away, shifting slowly down toward the float to avoid reperfusion injuries that came when blood flooded too quickly into tissues it had been wrung out of. His hands and face tingled. He saw Naomi's message again and remembered that he hadn't answered.

He tried to say *I'm fine*, but it came out as a croak. He massaged his throat for a few seconds, moving cartilage and muscle back closer toward their right places, and tried again.

"I'm fine," he managed. "I'm good. You?"

"I am very proud not to be sitting in a puddle of something unfortunate right now," she said, but the joke sounded angry. The *Roci's* burn dropped under a g, then under a half. He looked over. Her mouth was a profound scowl.

"They're not following protocol," he said.

"I should have taken Trejo's offer. This isn't going to work without someone enforcing it. There's not enough cooperation."

"Isn't now. It doesn't mean there can't ever be."

"They're people," Naomi said, exhaustion in her tone. "We're trying to do all of this with humans. Shortsightedness is coded in our DNA."

He didn't have an answer for that. A moment later, the comms went live, and Amos and Teresa reported in on the post-burn maintenance they were doing, Alex started getting a tightbeam lock on the *Falcon*, and Naomi

checked to see whether the ship had grabbed any waiting communication packets from the underground during their passage through the ring space.

Jim followed along, chiming in where he could help, but the thing that stuck in his mind like a catchy, bleak melody was Naomi's voice. *We're trying to do all of this with humans.*

The *Derecho* passed through the Freehold gate and into the ring space, the drive pushing a braking burn at the limit of the ship's tolerance—which was the same as saying the limits of the crew's. The *Derecho* could pour enough gs into its maneuvers to crush the skin-bound sacks of salt water in it. Tanaka was willing to spend a few lives if it meant catching her prey. If that made her bloodthirsty, so be it. She'd always been thirsty for something. It might as well be blood.

As soon as the gate distortion was gone, and even as she struggled to draw breath, she set the ship to scanning the vacuum at the edges of the more than thirteen hundred gates. The *Rocinante*'s drive plume might be gone, but the cooling cloud that had been its reaction mass was still there, slowly diffusing into the soft mist of hydrogen, oxygen, ozone, and water vapor that made up most of the physical mass in the ring space. In time, the particles would all drift into contact with the edge of the space and be annihilated, but until then, the information was there. A subtle finger, pointing the way her enemy had gone.

If only she'd made it through before it had dispersed too far to find it...

The *Derecho*'s drive kicked off, the ship went into freefall, and a wave of nausea rolled through her. She ignored it, pulling up her tactical display. The ring space was ridiculously full. It was still fewer ships than she'd seen in the average approach pattern to the naval base on Callisto, back in the day, but Callisto had never had to worry about extradimensional horrors eating some of the ships as they tried to land. Context was everything.

The *Derecho* had already scanned and dismissed all of them—none was the *Rocinante*. She pulled up the visual profiles and drive signatures

anyway. Recognition algorithms were brilliant, but they weren't the human eye. What could fool one often couldn't fool the other.

"Colonel Tanaka?" Botton's voice asked from her comms screen.

"What?"

The *Derecho* flagged a burst of light and high-energy particles coming through the Sol gate. The first tickling drive plume of some other ship about to transit through that ring.

"We have medical emergencies with..." Botton paused, caught his breath. "With several crew members. If we can pause long enough to remove them to the medical bay..."

"Do it," Tanaka said.

"Thank you, Colonel," he said.

"Where are you, you little *fucks*?" Tanaka muttered.

The Sol gate fluttered with light.

Bakari was fussing because he was frustrated. The pediatrician had warned Kit about this before they'd started the journey. The time in lower gravity would weaken Bakari's muscles and bones a little. Not so much that he wouldn't recover once he was in consistent gravity again, but enough that during the higher burns on the trip the child would find himself unable to do things he had previously done. The braking burn into the ring space had been noted in their first meeting as a place that children Bakari's age would be likely to struggle. At the time, it hadn't seemed too onerous.

Now it seemed onerous.

"Come on, little bear," Kit said, smiling down at the small face that looked back up at him in rage. "It's okay. Listen while we sing, yeah? Listen to us sing."

It was the third hour since Bakari had woken from his nap. Rohi had taken the first two. Now she was in the commissary buying spicy curry for the brothers from Breach Candy as an apology for the screaming and crying. The other passengers were kind enough not to complain and also

kind enough to accept their peace offerings gracefully. Afterward, Rohi had promised to spend an hour in the gym. Neither of them had been good about keeping to the exercise schedule, and they'd pay for that when the *Preiss* reached Nieuwestad.

"Listen," Kit sang. "Little boy, listen. Listen to your tired daddy sing."

He made a trill in the back of his throat, something he remembered his own father doing, back in the ancient days before the divorce. Bakari started, focused on him like Kit had grown a second head.

"Oh. You like that?" Kit cooed, then trilled again.

The little mouth unknotted, and like a miracle visited upon the faithful, the baby laughed. Kit grinned down at him, and Bakari grinned back.

"The burn is almost over," Kit sang, improvising the glide and skip of the melody. "Soon we'll pass the gate."

Bakari shifted his back from side to side, and reached up an arm the way he had since he'd been in Rohi's belly. He'd be asleep soon, and Kit felt a surge of anticipation. When his son slept, he'd nap too. God, he needed to sleep.

"Close your eyes and rest, son," he sang, and gently rocked the little crash couch. He pulled the vowel sounds long and soothing. "Nothing here you need..."

Bakari's eyes fluttered closed, then open again. There was something odd about the way the light caught the roundness of his cheek, and Kit lost his own tune, fascinated by the texture of his son's skin. The light showed so much detail, the folds of baby-smooth skin, the sheen of the oils, and Kit was somehow falling into it, descending into the fractal complexity. By the time he realized something was wrong, it was too late.

Bakari was there, as close as he had been before, but what had been his boy was a complexity of vibrations—molecules and atoms in clumps and patterns too baroque to show where one thing began and another ended. Kit fell what would have been forward onto what would have been his knees, and the pain of it was like watching dominoes fall, tiny electrochemical sparks passing from nerve to nerve. The shimmering in the air was Bakari screaming. And Kit screaming too. The feeling of the air abrading his throat was a cascade of rushing razor-sharp atoms.

Something more solid and real than they were slid through the jumble of atoms that was the wall. A thread of conscious darkness that had never

known light, was the antithesis of it. Kit tried to move the clouds that were his arms around the cloud that had been his son, knowing distantly that it couldn't matter. He was no more solid than the wall had been.

The darkness whirled toward him, scattering him. Scattering his son.

A voice as vast as mountains *whispered*...

The alarm caught Tanaka's attention. Something was going wrong at the Sol gate. It took a few seconds to understand what she was seeing. The influx of fast-moving particles had just dropped to zero. It would have meant the incoming ship had cut its drive, except there were still photons getting through. Whatever ship was coming in from Sol wasn't going to make it. They were already starting to go dutchman, and they didn't even know it yet.

It wasn't her problem, and even if it had been, there wasn't anything she could do about it. She turned back to the scatter analysis and the hunt for the *Rocinante*. There was a greater than 40 percent chance that something had passed into Bara Gaon in the timeframe she was looking at...

"Shit," she said to no one.

She let the *Derecho* keep crunching its numbers and pulled her screen back to the Sol gate. Watching the trainwreck. The light was growing smaller and brighter now. The drive had almost reached the gate. Without meaning to, she heaved a sigh. A whole lot of people were about to die for no reason other than they'd been unlucky with the traffic patterns. Sympathy plucked at her. It seemed petty somehow, with the universe crashing in all around them, for the enemy to still eat the occasional ship.

"Rest in peace, you poor fucks," Tanaka said as the drive plume blinked out, lost in wherever it was that the lost ships went.

An alarm chirped, and for half a second she thought it was announcing the loss of the Sol-based ship. But the *Derecho* wasn't worried about that. It was worried about everything else. Tanaka looked at the data and her gut knotted. She opened a feed from the external telescopes. The surface of the

space between the rings was glowing a pearly gray, with ripples of darkness moving through it in a way that made her think of sharks swimming through cloudy water. Adrenaline flooded her system, and a wave of vertigo so powerful she looked for a thruster malfunction.

“Botton,” she began, trusting the *Derecho* to know she needed a comm channel open. “We have a problem.”

The surface of the ring space shifted. Bent. *Boiled*.

The alien station at the center of the ring space flared like a tiny sun.

Something happened to Tanaka that felt like waking up without falling asleep first. Her awareness shifted, opened, became something it hadn’t been a moment before. She was in her crash couch, but she was also in the medical bay with her head in excruciating pain, and in Botton’s cabin with a bulb of whiskey in his hand and the burn of it in his throat. She saw through a thousand sets of eyes, felt a thousand different bodies, knew herself by a thousand different names.

Aliana Tanaka screamed.

A voice as vast as mountains whispered.

It whispered *No*.

The scattered world paused in its swirls and chaos. The dark threads froze in their places, vibrating and writhing but unable to whip through the clouds and points that were matter. The awareness that had been Kit, drifting and broken and scattered as it was, saw its own pain, its own distress, the still-flashing impulses that had been its child’s neurons as they fired. Something analogous to sound rumbled and roared, and the dark threads thinned. They became black strings, wet as blood clots. Then threads. Then wisps of smoke.

And then nothing.

The paths where the darkness had whipped the scattered particles apart shifted like a video message played slowly and in reverse. Something thought *stirring the cream back out of the coffee*, and it might have been

Kit. The interplay of vibrations that were the atoms and molecules, incomprehensible in their variety, began to segregate. The slow spinning flow like a river past a muddy bank became the air from a vent. Or blood passing through an artery. Density became real.

Surfaces emerged. Then objects, and then Kit was looking into Bakari's wide, frightened eyes. Kit's heart fluttered, as confused as a man who'd forgotten what he was saying midsentence, and then it pounded, each stroke so hard he could see the pulse in his eyes. He wrapped his son tight in his arms as Bakari started to wail, and held him close, sheltered against a threat he didn't understand and couldn't locate in space.

The other man, the one who wasn't in the room, slumped in exhaustion and closed his eyes. The cabin door slammed open, and Rohi was there, eyes bright and panic-wide.

"You're hurting him," she shouted. "Kit, you're hurting him!"

No, Kit tried to say, *I'm just holding him. He's only crying from fear.* He couldn't find the words, and when he looked down, he was squeezing too tight. He made his arms relax, and Bakari's wailing grew louder. He let Rohi take their son. His body was shaking, a deep pulsing shudder.

"What was that?" Rohi said, her voice shrill with fear. "What just happened?"

The *Falcon* was close to the Adro diamond, and while it wasn't on the opposite side of the local star, it wasn't at the point in its orbit closest to the gate either. The light delay was sixty-two minutes, which meant one hundred twenty-four would have to pass before the tightbeam lock was confirmed. Jim could, of course, send out a message on the beam of supercoherent light even before the comms handshake was done, but somehow it seemed rude. By being in the system, they were dropping a great big bucket of uncomfortable decisions in Elvi's lap. Giving her the chance to refuse to talk to him felt like the least he could do from an etiquette perspective.

He was spending the time until then doing a checkup with the autodoc in the med bay. The medical expert system had been upgraded three times in the decades since the *Roci* had been a top-of-the-line MCRN ship, and while there was better technology out there now, what they had was pretty damn good. Certainly, it was better than what he'd grown up with.

He let the system check-scan him for little bleeds and tears from the long burn and decant a slurry of targeted coagulants and tailored regeneration hormones. The worst part about it was the weird almost-formaldehyde aftertaste that haunted the back of his tongue for the two days following the treatment. Small price to pay for being 8 percent less likely to stroke out.

Naomi floated in, moving from handhold to handhold with the grace of a lifetime's practice. Jim smiled and gestured to the autodoc next to his like he was offering her the chair beside his in the galley. She shook her head gently.

He almost asked what was bothering her, but he knew. The high traffic in the slow zone. He almost said it wasn't her fault, which would have been true, but she knew that too. It didn't keep her from carrying the weight.

"Maybe Tanaka's ship went dutchman," he said.

As he'd hoped, she chuckled. "We should be so lucky. It's never the ones you want."

"Probably true."

"The worst part is that there is an answer, you know? We have a solution. There are probably dozens of solutions. All it would take is people agreeing to one and abiding by it. Cooperation. And I could—"

Alex's voice came over the ship comms. "Are you all seeing this?"

Naomi frowned.

"Seeing what?" Jim asked.

"The ring gate."

Jim pulled at his arm, but the autodoc chimed a complaint. Naomi put the wall screen on and shifted to the external scopes. Behind them, the Adro gate had been everything every gate was—dark, spiraling material formed unfathomable eons ago by the strange arts of the protomolecule. Only now, it wasn't dark. It was shining. The whole circle of the gate was glowing a blue white, with streams of energetic particles radiating from it like an aurora.

Naomi whistled softly.

“It just started doing that a couple minutes ago,” Alex said. “I’m getting a lot of radiation from it too. Nothing dangerous—a lot of ultraviolet and radio.”

“Amos?” Jim said. “Are you looking at this?”

“Sure am.”

“So, you know things you’re not supposed to know. Any thoughts on this?”

He could hear the shrug in the big mechanic’s voice. “Looks like someone turned it on.”

OceanofPDF.com

Chapter Twenty-Five: Tanaka

The captain of the *Preiss* was a flat-faced, pale-skinned man with a stubble-length beard that didn't hide his double chin. He'd spent two decades ferrying colonists to new worlds, and now he floated in Tanaka's cabin with a vague look on his face. He should have been frightened. He only seemed stunned.

By force of will, Tanaka kept from tapping her fingers against her thigh. She wasn't going to show anxiety, even in front of someone who seemed primed to overlook it. After all, this interview and all the others were being recorded.

"I've taken," he said, paused, licked his lips absently, "psychedelics. I've been places, you know? It wasn't like that. Not at all."

The *Preiss* was docked to the *Derecho*, the first of the ships waiting their turn for the Laconians to meet with their crews, copy the data from their sensor and comms systems, and generally go over everything with the finest-toothed of all possible combs. But the *Priess* was the most important. It was the only ship to ever shrug off going dutchman.

And if Tanaka had held any hope that its captain knew why, she would have been abandoning it right about now. "What is the ship carrying that's in any way out of the ordinary?"

His focus swam, found her. His shrug and scowl were perfectly synchronized, the result of a lifetime's practice saying *Fucked if I know*.

"We were just going through, same as always. The drive plume, it always hits first. But we couldn't see that anything odd was going on. Drive plume was in the way, you know?"

"I do," Tanaka said. Her jaw ached. "But there must be something. Something different this time? Had anything changed on this ship recently?"

"Got some new air scrubbers out of Ganymede. Charged graphene with

crosshatching. Supposed to last twice as long as the old kind, and you can wash 'em with distilled water. Reuse 'em five or six times."

"That's the only new equipment?"

"Since the last trip, yeah."

"What about the passengers. Are any of them shipping anything out of the ordinary?"

The shrug. The scowl. "It's all construction and climate engineering stuff. I don't know."

"Is any of it protomolecule-based technology?"

A flash of impatience crossed the thick man's face. "Everything's protomolecule-based technology. The lace plating's protomolecule tech. The biofilms around the reactor are. Half the food supply comes from things we built off that shit."

Tanaka took a deep breath and let it out through her teeth. It didn't placate her that he was right. But there had to be some reason that this man was here, floating at her workstation, and not vanished into the hungry void that was a failed transit.

She let it go.

"Did you have... any experiences associated with the event?" She managed to keep her voice steady, as if any answer would have been as good as another. As if just asking didn't make her gut tighten.

"Oh yeah. Oh, hell yeah."

Tanaka turned off the recorder. "Tell me what you remember. Don't feel like you have to make sense of it. Just your memory of the experience."

The man shook his head. Not a negation, but a gesture of wonder bordering on disbelief. "There was this thing where... I don't know. It was like being in the ocean, but the water was other people? You know how you dream, and maybe you're some other person? Like you dream you're old when you're a kid. Or a kid when you're old. It was like having a thousand of those dreams all at the same time."

Tanaka nodded. It was actually a pretty good description. She forced her jaw to relax.

"Do you still remember anything about those impressions? Or did the experience fade like normal dreams?"

He shrugged again, but almost gently. Like he was frightened or sad. When he spoke, his tone was almost wistful. "There's... scraps? There was

like a memory I had where I was a woman on L-4 maybe ten years ago? I'd just gotten a promotion or something, and I was drunk with some friends."

"Have you ever been on L-4?"

"Nah, but that's where I was. Where she was. Where she was when I was her. I don't know, it was fucked up."

"Do you remember anything else about her?"

"My skin was really dark. Like *dark* dark. And there was something wrong with my right leg."

"Okay. All right." Tanaka turned the recording back on. "We're going to hold your passage until we can interview everyone on board the ship and make a complete forensic scan."

She expected him to object, but he didn't. The *Preiss* was going to be late arriving on Nieuwestad, and the captain would probably lose a bonus at the least. Possibly owe a late-arrival penalty. If the monetary loss bothered him, he didn't show it. Tanaka's guess was that he'd had an experience that made the mere economic reality of his position seem less significant. She was seeing a lot of that in her interviews.

He hauled himself hand by hand out of the office to where her guards were waiting in the corridor. She thumbed the control, and the door closed behind him. The database of all crew and passengers from the detained ships was on the *Derecho*'s system. The data wasn't perfect. Some of the ships claimed to have suffered data loss during the incident, their systems corrupted and spotty. It just meant they were hiding evidence: maybe of smuggling, maybe of contacts in the underground, maybe of some glimpse of the *Rocinante*'s passage through the slow zone. She wasn't naive enough to believe these people were good citizens of the empire.

She'd care about that later.

Her own experience had been like a whiteout. One moment, she'd been watching the *Preiss* die in a failed transit. The next, she'd been in a hurricane of unfamiliar consciousness, battered by it. When she'd come back to herself, the *Derecho* had been on automatic lockdown. The crew had been stunned, confused. She remembered passing one woman in the corridor who was floating in a fetal position, tears in a bubble over her eyes like goggles made of salt water.

The glitches and lost consciousness were often associated with visual and aural hallucinations. This was a new variation, but that was all. She

wanted to believe that, and like anything she found herself wanting to be true, she forced herself to double-check it.

The initial search criteria was easy enough. Anyone female-identifying who'd been on L-4 between eight and thirteen years previously. Cross-reference that with medical records mentioning the right leg.

There was only one hit. Anet Dimitriadis, senior mechanic on the *Pleasant Life*, a freighter working between Corazon Sagrado, Magpie, and Pankaja systems. Tanaka resented the tightness in her throat as she pulled up the woman's file.

Anet Dimitriadis had skin so dark the system adjusted the image contrast to make her features clear. Like a rush of cold water in her gut, fear flooded Tanaka.

"Fuck," she said.

In the ring space, a soft and shadowless light spilled from the gates. Along with it, electromagnetic radiation on a range of frequencies filled the void like a jamming device. The *Derecho* took all of it in, filling the available memory with raw data from every sensor array it had. The ships that been in the ring space when the *Preiss* had done whatever trick it had done drifted, waiting for their turns to be questioned and released. A handful of other ships came through the gates, burning slowly, tentatively, like mice that thought they'd heard something meow.

What Tanaka wanted and what she could do were far enough apart to be independent variables. It would have been the work of years to put each and every person in the ships there in her office where she could grill them, scare them, threaten them. Find out what they remembered or thought they remembered. She didn't have years.

And, more to the point, this wasn't her mission. She was hunting Winston Duarte, or whatever he'd become, and hauling him—or it—back to Laconia. Whatever was going on here might be fascinating. It might be the most important thing in the universe. That didn't matter because it wasn't

her job.

Except that she'd found something more important than her job.

Twice a day, she ate in the *Derecho's* galley, but only because there was some deep, primate part of her brain that thought being around other primates would make her safer. The isolation of her office felt too much like vulnerability. But being around the crew was intensely uncomfortable in its own way. She ate her rice and egg slurry, drank her tea, and went back to her office, relieved to be alone again, but anxious too. She hated herself when she was like this.

She had Botton send representatives to each ship to conduct interviews, routing only the captains, scientists, and information officers directly to her. When she wasn't doing her own interviews, she had a dozen more to listen to, compare among each other, gnaw at like a dog to crack a bone down to the marrow. She switched between the feeds, catching a question or two, a phrase or two, and then moving on. *Kenst how you can pay attention to how, sa, just your foot feels? Like that, aber con a jéjé different bodies.* Tanaka shifted. *I had this intense sense of panic, but it wasn't my panic. It was someone else's, and I was feeling it.* She shifted. *There was someone with me, only he wasn't in the room. He was more with me than if he'd just been beside me.* She told herself she was bored, but that was a lie. She was restless, and that wasn't the same. She needed to get drunk, to get in a fight, to fuck. Something. Be doing anything that centered her fully in her own body, where she could forget being anything other than herself.

The message from Trejo wasn't unexpected, but she'd let herself hope it might not come. She decanted a bulb of red wine designed to her tastes—dry and oaky—and drank half of it before she played it.

The message was noisy—static and resolution loss and best-guess infills by the comm system fighting against the new noise from the ring gates. Even so, she could tell that Trejo looked like shit. His unnaturally green eyes had taken on an almost milky softness. His hair was whiter than she remembered it being, and thinner. The darkness under his eyes spoke of sleeplessness. Anton Trejo was Laconia now, and he was learning that it was too big for him. No wonder he wanted Duarte back. She recognized his office at the State Building. She'd only been away from Laconia for a few months, but it seemed like a memory from childhood.

"Colonel Tanaka," he said, nodding at the camera as if he were looking

at her. “I want to thank you for your report. I’m not going to bullshit you. The outcome in Freehold system isn’t what I was hoping for. But you were the one with boots on the ground. I’m not going to second-guess you. This other thing... Well, it’s concerning.”

“Well understated, sir,” she said to the recording, and squirted a little more of the wine toward the back of her throat. Nothing was as good on the float, and she had to breathe the fumes from her mouth up into her nose for the drink to taste like anything.

“I have ordered three ships from the Science Directorate to make all reasonable haste to the ring space, where they can make a complete survey. Your data has been provided to them and to Drs. Ochida and Okoye. If it is possible to get to the bottom of this, I have faith that they will.”

A buzz was slipping into his voice. His annoyance might be with her. It might be with the universe or the unjust nature of chance. Or maybe he hadn’t gotten laid in too long. She didn’t know how he lived his life. She steeled herself to take the brunt of it, whatever it was.

“I also understand that this is alarming and of interest, but I do think it’s a distraction from your primary objective.”

Primary objective. He wasn’t saying Duarte’s name. Not even here. It was a misplaced discretion. Teresa Duarte had been breaking bread with the enemy for almost a year. Naomi Nagata and the whole underground knew by now that Duarte was shattered. They might not know that he’d taken the trouble to resurrect himself, but they probably did.

He was trying to keep his secrets secret, even when there was every reason to think his beans were well and truly spilled. Her stomach hurt. She realized Trejo had been speaking while her mind wandered, and she rolled the message back.

“... from your primary objective. I need your focus here, Colonel. I am spinning a lot of different plates right now, and while I appreciate your enthusiasm, I need you to keep in mind that you are one part of something much, much larger. Trust me to take care of this whatever the fuck this was. You do your job. We will get through this clusterfuck together, just the same way we always have. The more you get off-mission, the less useful your mission becomes to Laconia.”

The message ended. It wasn’t quite a threat, which was nice. It wasn’t quite not one either. *Do the job I asked or I’ll pull your Omega status.* He

hadn't said it. He hadn't needed to.

Tanaka carefully enunciated the word *fuck* into the still air of her office, squeezed the last wine from the bulb, and hauled her way out into the corridor and toward the bridge. She was already composing her reply. *I have returned to the pursuit of the asset we discussed. I remain convinced she is the most likely path to completing the mission.* Before she sent it, though, she had to make it true.

It wasn't until she pulled herself to a stop on the bridge that she realized she hadn't been there since the event. At the stations, half a dozen crew in sharp Laconian blue were unnaturally focused on their screens. She had a terrible memory of being at lower university and walking into a study group room that suddenly went quiet. She didn't know if they were laughing at her or frightened of her. Her scarred cheek began to itch, and she took some pride in letting the irritation swell to pain without scratching it.

She cast her gaze around the bridge like she was aiming a weapon. She picked out all the little flaws—the places where the couches were beginning to wear, where the fabric had been replaced and didn't quite match. Something about these imperfections soothed her.

Botton was at the captain's station, strapped into his crash couch though there was no thrust gravity. When he saw her, he undid his restraints, pushed himself up to a mag-booted approximation of standing, and braced. She nodded, and he relaxed.

"I have had word from Admiral Trejo," she said.

Botton nodded. Was there a smile hidden there? Without wanting it, she remembered the taste of whiskey on his tongue, richer and peatier than when she drank it herself. The feel of it warming his throat. She had been in a cacophony of different minds, but that one, she recognized. She had been inside Botton in a way more intimate than even the most authentic sex. Had he experienced something like that with her? Was he, right now, recalling one of her trysts with inappropriate men? She suddenly felt violated and exposed, but he hadn't said a word.

If she had glimpsed inside Botton's actual and genuine mind, that was fine with her. But if he or other people had been able to access her private memories, know her—even for a moment—the way she knew herself? That was like waking up to find herself in mid-fuck with a stranger. She'd navigated her whole life on the unbroken membrane between her public self

and her private one. The idea that the separation might have been ripped open put her on the edge of almost animal panic.

She realized she'd been silent a beat too long. "The Science Directorate is sending survey ships to investigate the event and the hallucinations that accompanied it." She hit the word *hallucinations* just a degree harder than she needed to. She meant *You felt something, you recalled something, you experienced something. Don't assume it was truth.*

"Copy that, Colonel," Botton said. "I will recall our people from the other ships at once."

She glanced at the screen he'd been working at. It was the scan of the ring space that the *Derecho* had been making in the moment when whatever had happened had happened. She gestured toward it with her chin, and asked the question with her eyebrows.

Botton blushed. That was unexpected.

"I have been... reviewing the event," he said. "It was an exceptional moment."

"You have an opinion about it? Something you feel you should share with your commanding officer?" She said it coolly. It wasn't a threat, unless he thought it was. And then it was.

Botton didn't hear the warning. His stance softened, his gaze turned inward. She wondered, if the event happened again just then, what she might find in the place behind his eyes.

"The... hallucinations. I found them very unpleasant."

"As did I," Tanaka said.

"Yes, Colonel. I feel as though understanding what happened might better help to put the experience behind me. And I would very much like to put it behind me."

Tanaka tilted her head. There was an echo of her own fear in his voice. It occurred to her for the first time that she wouldn't be the only one who had felt the gestalt as a violation. For all she knew, Botton had secrets of his own to nurture and protect. It left her liking Botton a degree better.

"I'm sure the Science Directorate will be better equipped to make sense of this than we are," she said. "How long before we can be underway?"

"Transferring our crew back from the ships could take several hours." It sounded like an apology. She liked that too.

"As soon as they arrive, inform the remaining ships that they are to stay

here until the survey ships arrive and debrief them.”

“They aren’t going to like that. Several of the captains have expressed a strong preference to leave the ring space as soon as possible.”

“Any ship that leaves before being given permission will be labeled a criminal vessel and destroyed on sight by Laconian forces,” Tanaka said.

“I will make sure they understand.”

She took a deep breath. At the workstations, the other crew could have been living in different dimensions for all the reaction they showed to her conversation. On Botton’s screen, the ring gates flared white. And the alien station at the ring space’s heart matched them. The *Derecho*’s sensor arrays lowered their sensitivity to keep from whiting out. When the image returned a second later, the rings were glowing points all around the surface of the slow zone.

I’m missing something. The words were like a whisper in her ear. Something the captain of the *Preiss* had said. Or something about the newly glowing gates. Or had Botton accidentally said something that would unlock the mystery, or better, give her control over it?

“We have evidence that something made a transit to Bara Gaon system in approximately the right time frame,” Botton said. “Shall we proceed there?”

“Yes,” Tanaka said. “Alert me when the full crew has returned.”

She clicked on her mag boots, used her ankle to turn her body and to stop it, then launched herself back toward the lift. Behind her, someone let out a long, stuttering breath as if they’d been holding it the whole time she’d been there.

Bara Gaon was an active system. If the *Rocinante* had fled there, it was because they hoped to use contacts in the underground to cover their passage. Any data she got from the official sources, she’d have to double-check herself in case it had been corrupted. Her mind ran forward along the path of the chase, and it was a relief.

She needed to go to the ship’s gymnasium and punch a heavy bag. *I used to be a boxer when I was young.* The thought wafted through her mind like she’d heard someone say it. It wasn’t her voice. She ignored it. She needed to eat. She needed to report back to Trejo. She needed to track down the *Rocinante*. She needed to find Winston Duarte or whatever he had become. She felt duty sliding in around her mind like blinders, cutting away the

distractions.

She had a mission and a score to settle. Unthinking, she scratched her wounded cheek.

She was missing something.

OceanofPDF.com

Chapter Twenty-Six: Jim

Jim couldn't sleep. He lay on the crash couch, the gentle one-third g of the burn settling him into the gel, and tried to will himself into a sense of peace and rest that wouldn't come. Naomi, beside him, had curled onto her side, her back toward him. There had been a time when he'd slept with the lights entirely off, but that had been before Laconia. Now he kept them low—less than a single candle would have been but enough that when he woke from a nightmare, the familiar outlines of the cabin would be there to ground him. He hadn't had a nightmare. He hadn't slept at all.

Naomi murmured something in her sleep, shifted, and settled. Years of experience told him she was sloping down into the deepest levels of dream. Another few minutes and she'd twitch once like she was catching herself from falling, and after that, she'd snore.

This was the life he'd dreamed of during his imprisonment. This was what he thought he'd lost forever: suffering a little insomnia while his lover of decades rested at his side. That the universe had given it back to him after he'd given up hope flooded him with a profound gratitude when it didn't frighten him. This was so small, so precious, and so fragile.

They were both mortal. The one thing he knew for certain was that this couldn't last forever. Someday, there would be a last meal with Naomi. Someday there would be a last sleepless night for him. A last moment hearing the *Roci's* drive humming around him. He might know when it came, or it might only be clear in retrospect, or it might end for him so quickly that he never had time to notice all the beautiful, small moments that he was losing.

Naomi jerked, went still, and then the low, soft rumble of her snore began. Jim grinned through his weariness, counted her breaths up to two hundred to give her time to fully commit to slumber, and then pulled himself up out of the couch and dressed in the gloom. When he opened the

door to the corridor, Naomi turned to look at him. Even though her eyes were open, she wasn't awake.

"No troubles," he said. "Keep sleeping."

She smiled. She was beautiful when she smiled. She was always beautiful. He closed the door.

They'd made it almost three-quarters of the way to the *Falcon*, and were in the earliest part of their braking burn. Elvi's messages to them—that they could dock, that she'd see to it that there wasn't a security problem, that they were welcome—had a sense of normalcy that didn't match the situation at all. Even as Naomi had responded with their flight path and expected intercept coordinates, Jim had been struck with the absurdity of treating it like popping over to someone's apartment for dinner, when in reality it was more like conspiracy to commit treason. But the *Derecho* hadn't followed them through the gate, and there was literally no place else for a ship to hide. At some point, Adro had been a solar system capable of sustaining life. Now it was a star, a green diamond the size of a gas giant, the *Falcon*, and the *Rocinante*.

Jim reached the lift and rode it slowly up through the quiet ship until he reached the ops deck. Alex was standing beside a crash couch, a bulb in his hand and the bright gate on the screen in front of him. They were far enough from it now that, if he'd gone outside, Jim wouldn't have been able to distinguish it from the billions of stars. On the scopes, it radiated swirling waves of aurora-like energy.

"Hey," he said.

Alex looked over his shoulder. "What're you doing up?"

"Couldn't sleep. Thought I'd see if you wanted me to take watch."

"I'm fine," Alex said. "I'm shifted over. This feels like midafternoon to me. You want a beer?"

"A midafternoon beer?"

"I didn't say it was morning," Alex said, and scooped another bulb off the crash couch. Jim caught it, broke the seal, and took a long swallow.

"I've never understood people who like beer without gravity," Alex said. "That's not a drink. That's a vaguely alcoholic kind of foam."

"No argument," Jim said, then nodded toward the screen. "Anything?"

"Nothing new, but..." Alex gestured at the bright ring. "I don't know. I keep looking at it. Wondering what the hell it's doing."

“Well, it hasn’t killed us. That seems like a good start.”

“Could definitely be worse. But... You think you know something, right? Then it turns out you were only *used* to it. It does something, and it does something, and then after a while, you think that’s what it does. Then it turns out there was this whole other thing, maybe.”

“Using a microwave as a lamp, because it has a light in it,” Jim said. He tried to remember where he’d heard that analogy.

“Yeah, exactly,” Alex said. “You thought you knew it, but you were only familiar with it.”

Jim took another sip of the beer. The hops tasted like mushroom, for good reason. “I’m hoping that Elvi has figured some things out. I mean, she’ll know better than we do.”

“We can hope,” Alex agreed, then squeezed the last of the beer out of his bulb and tossed it into the recycler. His belch was deep and satisfied.

“How many of these did you have?” Jim asked.

“A few.”

“Are you drunk?”

Alex considered the question. “A little, I guess.” He lowered himself into the crash couch. “There was this time when I was a kid, I had a really crap babysitter. I was maybe nine? She was sixteen. And we watched this monster film. A huge cat monster that lived underground, and it got pissed off by some seismic surveys. Came to the top and started tearing up cities and collapsing tunnels. Scared the shit out of me.”

“Weird the things that get to you when you’re a kid,” Jim said.

“I knew it wasn’t for real. I was young, I wasn’t dumb. But it still scared me, and the thing my dad told me that actually got me past it? He showed me how it wouldn’t scale.”

“Wouldn’t scale?”

“Volume goes up by cubes. A cat big enough to crush a city wouldn’t be strong enough to stand up, even at Martian gravity. Its bones would break under its own weight. And that did it for me. I was all right, because I saw it couldn’t work. This is like that cat, it doesn’t scale.”

Jim sat with that for a second. “Either you’re too drunk or I’m not drunk enough. I don’t get it.”

“The gates. The systems. It’s bigger than us. It’s bigger than we *can* be. I mean, have you ever thought about what it would be like to see every

system there is now? To see just the places where we are? There's thirteen hundred seventy-three gates—"

"Seventy-one. Thanjavur and Tecoma are gone."

"Thirteen hundred and seventy-one," Alex agreed. "Now let's say you plot it so that you don't have to slow down when you get to the ring space. Accelerate all the way to the ring gate, brake all the way back to the goldilocks region at wherever you're going. Maybe take you a month to do it."

"You'd run out of reaction mass."

Alex waved the objection away. "Pretend you could stock up in flight. All the reaction mass and fuel and food and everything. And liquid helium to boil off the waste heat."

"So ignoring every actual constraint that makes it impossible?"

"Yeah. Five billion clicks a month, every month. No time on the float. No time at the planets. Just—" He threw his hand forward, a gesture of speed.

"All right."

"Hundred and fifteen years. Start it the day you're born, and finish it an old man, and never see anything but the inside of your ship. Take a week at each planet—not each city, not each station, each *planet*—to play tourist? Add another twenty-eight *years*. A hundred forty-some years old. That's a solid lifetime, just to take a peek. Get the lay of the land. Never see the same place twice."

Jim thought about that. Between working for the Transport Union back in the day and fleeing with the underground, he'd been to more systems than most people ever would, and it was still probably under three dozen. He knew how many more there were, how many he'd never see, how many Naomi was trying to coordinate. Alex was right. It was daunting. Maybe more than daunting.

"And that's not the worst of it," Alex said. "By the time you're done, there's been a century of change at the place you started from. It won't be the same. All the places you visit start changing into new ones the second you leave."

On the screen, the bright gate shifted and muttered. The false-color map showed radio waves and X-rays pouring out of it. Jim couldn't help imagining it as a vast eye looking back at them.

“This is all too big for people,” Alex said. “The things that built it? Maybe they could handle it, but we’re not designed for this scale. We’re trying to get big enough we can make it work, but we’re breaking our legs just standing up.”

“Huh,” Jim said. And then, a moment later, “You got any more beer?”

“Nope.”

“Want some?”

“Yep.”

With its drive off, the *Falcon* was no more than a small, oddly shaped asteroid at first. It was a little under three hundred thousand kilometers off the Adro diamond, orbiting it like a tiny artificial moon. The artifact itself was eerie: vast and green and flickering now and then with murky internal energies like storms that penetrated deep into the flesh of the object. The planet. The library. Jim knew enough about Elvi’s preliminary work that he could appreciate the supremely unnatural aspects of the thing: that it didn’t collapse under its own mass, that it was connected using the same locality-breaking principles as the ring gates, that it had the capacity to hold vastly more information than humanity had generated in its millennia of progress. The *Falcon*—pale-skinned and half-organic the way Laconian ships all were—would have been unnerving in any other context. Here, Jim felt a weird kinship with it. The technology might be alien, but the design language was mostly human.

Alex brought them into a matching orbit, maneuvering the *Rocinante* gently into place until the two ships seemed like they were already connected. Locked by the common forces of velocity and gravity. The *Roci*’s crew gathered at the crew airlock as Amos prepared to extend the docking bridge.

“You know what’s funny?” Jim said. “I feel certain this door will open and Tanaka will be standing there with a bunch of Laconian Marines in power armor ready to charge across.”

Teresa rolled her eyes, but Naomi laughed. “That’s not going to happen.”

“Of course not. But I’m certain it will. That’s weird, right?”

She took his hand, squeezed it once, and as she looked into his eyes, she said, “This is all right. Elvi is with us, and she’s in command of this ship.”

“Besides,” Alex said, “if she’s not, they’ve had plenty of time to call for backup. No one’s here besides the two of us.”

Jim nodded. He knew that the fears were irrational. That didn’t keep him from feeling them, but it did make it a little bit easier to take them lightly. Alex was right. They’d announced Elvi’s complicity to her crew the moment they’d transferred into the system, and no one had sounded the alarm as far as they could tell. The connection of their two ships, the transfer off the *Rocinante* and onto the *Falcon*, was almost symbolic compared with what they’d already done.

Amos clicked the last of the safety latches into place and keyed in the syncing protocol. A soft hissing vibration meant that the docking bridge was moving out, creating a corridor between the ships.

“Still, I don’t think we should all go over,” Naomi said. “Not at the same time, anyway.”

“Not until we know the situation over there,” Alex agreed.

“Not ever,” Naomi said. “One of us is always on the *Roci*. That’s a rule. I trust Elvi, and I trust her to know her crew. But I trust us more.”

Alex raised his hand like a schoolboy answering a question. “I’m happy to keep an eye on the farm if y’all want to go over.”

“I think Amos should stay too,” Naomi said.

“Better if I came with,” Amos said. “Nothing happening over here Tiny can’t keep eyes on.”

Naomi hesitated, and Jim wondered for a moment what would happen if she told Amos he had to stay. Maybe Naomi had the same doubt. “All right,” she said. “Alex and Teresa stay here for now. The rest of us go make introductions.”

Naomi caught his eye and lifted one eyebrow. She meant that he didn’t have to go. He shrugged. He meant that he did.

“Works for me,” Amos said, hauling himself into the airlock. “And we got a seal, pressure, and an invitation.”

Jim followed Naomi into the airlock and felt it in his bones when it

cycled shut behind them. His fear of Tanaka had shifted. Now some part of him expected the outer airlock door to open onto the void, for the air to flow out and death to rush in. Instead, there was a soft clank, a hiss of gas as soft as an exhalation, and the gangway. The *Falcon's* outer airlock was already open, and the three of them launched across to it. The air smelled different. Bright and astringent.

When the *Falcon's* outer door closed, its inner door opened, and Elvi Okoye was there. Fayez floated beside her with a black-eyed girl. Elvi smiled, but she looked terrible. Her skin had an ashy tone, and her arms and legs were visibly atrophied.

“Naomi, Jim,” she said, drifting toward them like an obscene parody of an angel. “It’s good to see you again. And Amos.” As she stopped herself with a handhold, Elvi’s gaze flickered across Amos, and for a moment there was something almost like hunger in her eyes. The focus of a taxonomist on an important new species. “I’d heard you changed like Cara and Xan. I would really love to do a few medical scans while you’re here. If that’s all right with you?”

“If it helps, Doc,” Amos said, then turned to the black-eyed girl. She had very different features from Amos, but the blackness of their eyes, the grayness under their skins, left Jim’s brain trying to see the similarity as a family resemblance. “Hey, Sparkles.”

The girl frowned and started to say something, then stopped.

“Well,” Fayez said. “This is just awkward as hell, isn’t it?”

Elvi shook herself and motioned them in. “Please come in. I’ve had a little welcoming party set up, and we have a *lot* we need to talk about.”

Chapter Twenty-Seven: Elvi

The *Rocinante* had come through the Adro gate, the gate had lit up like a radio and X-ray bonfire, and Elvi knew that the game had changed. She hadn't known what it had changed into or what the consequences of the change would be, but without doubt, the ways she'd been operating were the old ways now.

The immediate response on the *Falcon* had been barely restrained panic. An enemy gunship was in the system. The *Falcon* was far from defenseless, but were they going to be in a battle? Had the underground come to drop nukes on the BFE the way they had the construction platforms? What had they done to change the ring gate? Elvi led by example at first. She didn't panic, and it gave everyone else permission not to panic either. Then the first tightbeam from the *Roci* arrived, Naomi brought her up to speed, and Elvi had some decisions to make.

The first job, and the one that would shape what came after, was talking to Harshaan Lee.

The younger man floated in her office with his ankles crossed and his arms held behind his back in a way that opened his chest. He listened with the calm focus of a researcher taking in a new body of information. Only this was information that reframed his own life and his prospects for survival.

"I'm not going to apologize," Elvi said. "Admiral Trejo knows very well how I feel about all the political and military wrangling in the face of this existential alien threat. If he finds out... *When* he finds out about this, he won't be surprised. But he won't be happy either."

Dr. Lee let a long, slow breath out from between his teeth, half sigh and half deflation. "No, I see that he won't."

"If you'd like, I can incarcerate you," Elvi said. "When this all comes out, you'll be able to honestly say you couldn't do anything about it."

Lee was silent for a long moment, his gaze shifting as he thought. Elvi admired the man's intelligence and professionalism. She didn't know what he'd say or do, but if she did need to start moving down her chain of command until she found someone who'd toe her line, it was going to be a long, difficult day.

When he spoke, his voice was a mixture of resignation and amusement. "I am an officer of Laconia and a patriot. You are my commander and the head of the directorate in which I serve. Your collaboration is unorthodox. After San Esteban, unorthodox may be necessary. I understand your rationale. You may rely upon me."

"Thank you," Elvi said. "And Harshaan? I have access to the comms. And I have monitors on them not even the comms officers know about. Don't fuck with me. I'm here to win."

"Very much understood," he said.

With his support, the rest of the crew shifted from fear to confusion. She wouldn't have thought it, but there were some real advantages to working in a system that treated chain of command with an almost religious zeal. At least when she was the one with the authority.

Communication through the gate had always been spotty. In Sol system or Laconia—and increasingly in more developed colonies like Auberon and Bara Gaon—repeaters were plentiful enough for robust routing solutions. If one failed, the others would notice and track their signals around it. In Adro, there was a single thread of repeaters that the *Falcon* itself had dropped on the way out and the one at the ring gate that the underground or pirates or vandals occasionally destroyed. The new flood of radio pouring off the ring gates acted like a signal jammer and made the system even less reliable. But slowly, during periods of low activity and on frequencies the ring's new activity seemed to ignore, a deeper picture of what had happened began to reveal itself to her. By the time the *Rocinante* arrived, she had as clear an understanding of the new status quo as anyone except possibly Ochida and Trejo. More than that, she had a plan. And getting Dr. Lee on board had been more straightforward than the risks she needed the *Rocinante* to shoulder.

She waited in the airlock with Faye and Cara. She would have invited Dr. Lee and Xan, but they wouldn't be coming to the briefing. There wasn't enough space in her lab for all of them. She felt the anxiety in her chest like

a spring wound up a quarter turn too tightly. Floating beside her, Cara fidgeted, clasp and unclasp her hands. Wringing them. Elvi had always thought that was just a figure of speech.

“Still time to back out of this,” Faye said.

“No there isn’t,” Elvi said.

“No. You’re right.”

The airlock’s outer door cycled closed. There was a soft click as the inner door’s bolts came free. The door slid open, and they were there.

Naomi looked very different from the last time Elvi had seen her in person. They’d both been much younger then, and she remembered Naomi as a soft, almost retiring presence who had the habit of hiding behind the spill of her own dark, curling hair. The woman in her airlock had a harder face, hair the white of snowfall, and nothing reticent about her. The cameras did a great deal to disguise the gravity with which she held herself. Somehow, across the reach of decades, Naomi Nagata had become the kind of person Elvi could imagine sitting across a table from Anton Trejo. She wondered if Trejo knew that.

James Holden, on the other hand, looked exactly like himself, but older. Of course, she’d seen him much more recently on Laconia. She’d had time to adjust to the years in his face and the vague, bemused look in his eyes.

“Naomi, Jim. It’s good to see you again,” she said. The man beside them gave her a friendly smile. She might only have imagined Cara’s near-silent gasp. “And Amos. I’d heard you changed like Cara and Xan. I would really love to do a few medical scans while you’re here. If that’s all right with you?”

“If it helps, Doc. Hey, Sparkles.”

They were all silent for a moment. Criminals and conspirators tasked with saving humanity from itself and the enemies bent on its destruction.

“Well,” Faye said. “This is just awkward as hell, isn’t it?”

“Please come in. I’ve had a little welcoming party set up, and we have a lot we need to talk about.”

As they passed through the ship, the crew was careful not to notice them. Elvi tried to imagine what she’d have felt in their place. The enemy welcomed into their home. She wondered how many of them guessed that Teresa Duarte was in the ship they were linked to. If she’d tried to design a pressure test to see whether her people would rat her out to Trejo, she

couldn't have done better than this. She hoped that none of them had a back channel out that she didn't know about. If they did... Well, that would be an interesting problem.

They reached the lab, and she ushered them all in like she was back in college and hosting a party in her dorm room. She went in last, closing the door behind her.

"Welcome to my little world," Elvi said, gesturing at the lab.

Naomi grabbed a handhold, stopped herself, and looked over the space, approving. Elvi had become so used to the half dozen multifunction workstations, the heavy air scrubber built to capture dangerous chemicals and put out any fires, that having new people looking at it felt like a reminder it was there. It had all become as familiar as her own body and as easy to take for granted. Most of what the *Falcon* was doing in Adro was medical scans of Cara and geological scans of the diamond, but the ship was built for everything from electron microscopy to vivisection.

"It's lovely," Jim said, and he almost seemed genuine, but not quite.

"It's a fucking prison," Elvi said with a smile. "But it's mine."

She grimaced when she realized she'd just claimed to be locked in a prison to a man who had spent the previous few years being tortured in an actual prison, but the look on his face didn't change. If he noticed her gaffe he had the grace to ignore it.

"I'm sorry we put you in a hard position," Naomi said. "I know you're taking a risk letting us come here."

Elvi made a shooing motion with her left hand as she pulled a display onto the wall screen with her right. "It was the right thing. You do what you have to when the universe is on fire."

"Is it?" Naomi asked.

"On fire?" Elvi said. "That's actually a really interesting question. You know about the new event?"

"We've been running dark," Naomi said. "The only things we know, we heard from you."

"Well, you were part of it, whatever it was." She pulled up the ring gate on the wall in its new, bright form. A cascade of analytic data spilled out in columns beside it. "You were part of the trigger anyway. Most of the direct data I have is from Colonel Tanaka."

"The one who keeps trying to kill us?"

“The same,” Fayez said. “She’s been doing field reports and sending us the raw data while you were on your way here. She had scanners doing live sweeps of the slow zone looking for traces of your passage when the shit hit the fan. And she was even watching the turd in question.”

Elvi gestured and the screen shifted to the familiar bubble of the ring space with its hundreds of gates equally spaced along the surface. She zoomed in on one that was at an oblique angle to the telescope capturing the image, the circle of the gate bent by perspective into an oval. A glimmer of light shone in the center of the ring gate like a firefly. The drive plume of a ship braking before it passed through.

“Sol gate,” Elvi said. “Still almost half the traffic in and out of the ring space goes through there.”

“But there was a lot of other traffic,” Naomi said, grimly. “Including us.”

Elvi shifted her hand, and the glimmer in the gate slowed. A readout said they were watching it several thousand times slower than it had actually happened, but the feed wasn’t choppy. Jim crossed his arms, scowling. Amos and Cara watched with a matching interest and stillness. The glimmer grew brighter, until it was pure white on the screen.

“It was a colony ship,” Elvi said, her words fast, staccato, and anxious. “It attempted transit a few seconds after Tanaka’s ship came in. We don’t know how many other transits had happened before, but that doesn’t matter. Enough to put the threshold up over safety.”

The glow brightened... and it died. Elvi felt a sting of excitement, but only because she already knew that the lives she was watching end, hadn’t. Somehow they’d been saved. The drive plume returned, coalescing inside the ring space like the ship had made its passage after all, even though it had clearly vanished just moments before.

“What the fuck was that?” Naomi murmured.

“The ship went dutchman, and then came back. But that’s just the pregame show,” Elvi said. “Watch how much the ring entities liked it.”

The edge of the slow zone bubbled, brightened, roiled. Elvi had seen that before. The *Falcon* had been the only ship to survive the last time this had happened. When she spoke, her voice was tighter and higher. “This is what we saw when we lost Medina Station. It’s a direct intrusion across the ring space’s barriers. It killed Medina. It killed the *Typhoon*.”

“Too bad it didn’t kill Tanaka,” Amos said.

Patterns played across the ring space like malefic auroras, and a darkness moved in the light. Elvi found herself hunching over like she was protecting her belly from a punch. She forced her spine straight.

“And then this,” Elvi said.

As one, the ring gates and station flared white, a brightness that overloaded the telescopes for three long, terrible seconds. When the light faded, like letting out a long, slow exhalation, the ring space returned to itself, with all the drive cones and transponders and traffic that had been there before. Including the colony ship that they’d watched vanish and reform.

“It’s not just the Adro gate that lit up,” Naomi said.

“No, it’s all of them. And when that happened, there was a cognitive effect. Most of the data Colonel Tanaka has been providing has been about that.”

“A cognitive effect like the lost memory?” Naomi asked.

“Nope,” Fayez said. “Very, very different.”

“It looks like it may have been a kind of networked connection between the minds of the people in the ring space,” Elvi said. “All the crews of all the ships. It was apparently fairly overwhelming. But there’s an indication that they all participated in each other’s memories and experiences.”

Amos scratched his chin. “That sounds like what’s been going on with me and Sparkles.”

“It does seem very similar to what you, Cara, reported during the dives into the BFE.”

“BFE?” Amos asked.

“The diamond. The library.”

“Why BFE?” Jim said.

Elvi scowled and shook her head. “The point is, when we saw it with you two”—she gestured to Cara and Amos—“we had assumed it was because you’d been modified by the repair drones. What happened in the ring space, that happened to unmodified human beings. The effect didn’t last very long. Almost instantaneous, really. But the memories have been vivid and persistent. The radiation from the gates is also interesting. Take a look at this.”

The display shifted into something that looked like an impossibly

complicated spiderweb. With a gesture, Elvi rotated it, then looked over at Jim.

He nodded and said, "I have no idea what that is."

"Communication between the gates," Elvi said. "We think the patterns in the radiation set up handshakes between the gates similar to the one we saw here between Cara and the... diamond."

"The gates are talking to each other?" Naomi said.

"We've been using them as a matter transport system, which they are. It makes sense that they're also a communication network."

A tickling sensation crawled up Jim's neck and he shuddered. "Amos said something about there being a kind of light that can think."

"Yes," Elvi said. "One model that goes pretty well with this architecture is a neural network. A really small one, but the signal processing between them has some real similarities. If it's a fully meshed network with each connection acting like a synapse, that's a little shy of a million. So about a tenth as smart as a fruit fly. If they're making connections between gates with different frequencies acting as distinct connections, they'd need something on the order of ten million different frequencies just to get as smart as a house cat—"

"Are you saying that the gates are alive and *thinking* on their own?" Naomi asked. The tremor in her voice was almost like fear.

"No. I'm also not saying they aren't, but as biological systems go, this is really pretty simple." She paused. "I was trying to be reassuring."

"Not sure it worked," Jim said.

"Didn't," Naomi agreed. "Really didn't."

Elvi shut off the wall screen and used a handhold to turn toward them. "I'm sorry. I've been deep in this for so long, I get happy when I find anything that isn't overwhelmingly complicated. I have a friend from my postdoc who spent five years modeling protein cascades in trout livers. I'm supposed to do that depth of analytic work in half an hour five times a day. It's been inhumane."

"I've been running a guerrilla government with shitty communications, thirteen hundred different isolated systems, and literally billions of people who think whatever they're looking at is the most important thing there is," Naomi said. "I know how you feel."

"Let me try again," Elvi said. "There's good news. Ever since the rings

began radiating like this, there hasn't been an event in any system. No loss of consciousness. No change in any basic physical constants or the laws of physics. No more San Estebans with massive numbers of people dying with no warning or defense."

"Not sure that makes sense, Doc," Amos said. "They weren't able to stop it."

"They?" Naomi asked.

Amos gestured at the dead wall screen as if it would show what he'd meant to say. "The ones that made all this. They got killed. They didn't have a way to stop it once it started. They shut down the gates to try and quarantine themselves. Nothing stopped the attacks."

"Not for them, no," Elvi agreed. "Which makes this very interesting. And there is another factor. The shared consciousness thing? One effect was that people came away with impressions from lives that weren't their own. Some episodic memories. Some procedural. I'm sure the data Colonel Tanaka's collecting will fuel a billion doctoral theses on holographic memory-encoding paradigms, but one of the things that keeps coming up was an awareness of a man who was present but wasn't there. More than two percent of the people who experienced the event talked about him. And he's in my dataset too. Cara's seen him. The other one."

They all turned to the girl. For a moment, she seemed smaller, more vulnerable. Like the girl she'd once been. Elvi expected her to speak, but Amos was the one to answer.

"Duarte. You think it's Duarte."

Fayez shrugged. "He was massively altered with protomolecule-based technologies. He popped himself out of a coma and went missing. And now this? Yeah, it's our best guess."

"So when he went missing, he vaporized? He's a protomolecule ghost now?" Amos said. "Haunting the network?"

Jim looked ill, and Naomi put her hand on his elbow, squeezing lightly. Cara looked over to Amos, and Elvi couldn't tell if the girl was uncomfortable that he was there or if she was looking to him for protection.

"I have no idea what happened to him, physically. But it is possible," Elvi said, "that he's been using the work we're doing here to... piggyback. That he's aware of the things Cara and Amos are aware of. That he's finding some separate application for it."

“That he hauled himself up out of a coma more powerful than before,” Jim said.

“It’s a theory,” Elvi said.

“What do we do if you’re right?” Jim asked.

Elvi steeled herself. “I think we should try a dual dive. Put Amos and Cara in separate sensor arrays, bring out the catalyst, send them both into the library together. Up to now, Amos’ experience has been mediated by their connection. If Cara and Amos are together, it could very plausibly give them more control than Cara’s had going by herself.”

“Control’s good,” Amos said. “What do we do once we have control?”

“We try to talk to him.”

Chapter Twenty-Eight: Tanaka

Tanaka knew as soon as they made the transit that the trail had gone cold, but it took time to confirm it.

Gewitter Base was Laconia's largest military installation in the Bara Gaon system. Made up of three rotating rings spinning around a central zero-g dry dock, it housed nearly seven thousand permanent officers and personnel. Two *Storm*-class destroyers remained on constant combat patrol around the station, monitoring all traffic through Bara Gaon's ring and tracking the commercial traffic moving through the system.

Bara Gaon was one of the Laconian Empire's most important industrial hubs. Bara Gaon-5 was a ball of soil and water placed in the exact center of the goldilocks zone, and with so little tilt to its axis that its seasonal changes were nothing more than mild suggestions. Significant volcanic activity in its early formation meant the crust was full of useful metals, and the soil was well suited for adaptation to Earth organics. In orbit around it, the Bara Gaon Complex floated, a massive construct of shipyards and low-gravity production facilities.

The tracking systems from Gewitter they'd linked to the *Derecho* showed that, in addition to the two destroyers, there were four deep-space telescopic satellites, three dozen Laconian radio listening stations, and seventy-three ships currently under thrust in the system.

Not one of them had seen the *Rocinante* come through the ring.

While the *Rocinante* might flee into the system and then try to get the underground to help them hide, it was impossible to believe they could have made the transit without being spotted.

Tanaka had the SigInt people run a deep background on the system's governor to make sure she wasn't on the take from the resistance, but it was pro forma. Tanaka didn't expect them to find anything. She'd just followed the wrong lead.

“It looks like it was a supply ship out of Firdaws called the *Forgiveness*,” Botton said, standing next to her at the bar in Gewitter’s upscale officers’ club. He laid his terminal on the bar and pulled up a holographic 3-D model. “Former colony ship owned by a liability collective and run by Captain Ekko Levy.”

The décor was a tacky style they called Martian Classical. Lots of fake wood and polished metal mirrors surrounding carved stone tabletops. A few other people sat at the tables, chatting and drinking and eating mediocre pub food. But the lighting was good, and the music was low enough to allow for quiet conversations. After a few weeks on the *Derecho* staring at the same cloth-covered bulkheads every day, even the club’s fake wood paneling felt like luxury.

“No chance they were a deliberate decoy to pull us off the trail?” Tanaka said, knowing the answer before Botton replied.

“They don’t show up in any intelligence databases. If we were confused by the timing of their ship making the transit out of the ring space, it seems more likely that it was unintentional on their part.”

If we were confused. Botton was being diplomatic. This was her mission. She was calling the shots.

“We followed the wrong scent,” she said.

“It looks that way,” Botton replied. Tanaka shot him a look of irritation. She wasn’t looking for his agreement. Botton’s expression didn’t change. He waved the bartender over and ordered a second beer as if he hadn’t noticed.

As Tanaka brooded over her options, the bartender brought Botton his beer and a bowl of dried and salted seaweed flakes. He looked at her, as though trying to gauge whether asking her if she wanted another drink was more dangerous than ignoring her entirely. He made the right call and walked away without a word.

After the silence had stretched out long enough to make her point, Tanaka said, “I’ll check my other leads. In the meantime, call up signal intelligence. Put the word out to every ship and relay on the network. They’ll be running without a transponder, but we’ve got the *Rocinante*’s drive signature and hull profile.”

“Copy that,” Botton said, and started to leave, most of his second beer still sitting on the counter.

“Also? Go back over the sensor data we took in when we passed through the ring gate. Run the analysis again, omitting Bara Gaon. Maybe there’s something there we overlooked.”

“Aye, aye, Colonel.”

“And make sure they understand,” Tanaka said, “that finding this ship is a security priority. Failing to report will be considered an act of sedition and punished by being sent to the Pen.”

“I thought Major Okoye ordered the dismantling of the Pen?”

“I’ll build a new one.”

“Understood,” Botton said, and left the bar in an overly casual hurry.

She pulled up her personal message queue and started the long process of demanding reports. The questioning of Duarte’s friends and intimates hadn’t turned up any other visitations, but the interviews of second-degree connections were ongoing. It looked like a dead end to her, but there was someone on Laconia whose job was to tell her so, and they could fucking well do that. Ochida hadn’t gotten her an updated study of the egg-ship thing. She sent a request for that. It queued. There was congestion at the repeater network because of interference coming off the ring gates. Three notifications were waiting for her with intelligence about San Esteban and the death count there, not that she had any clear idea what she was supposed to do about it. Feel bad that she hadn’t found Duarte in time for... what? For him to stop it from happening? Everything about the situation chafed.

The bartender risked returning. “Anything else I can get for you, Colonel?” he asked, giving the bar top in front of her his friendliest smile while he said it.

“Club soda,” she said, then taking a guess, “Chief?”

“Jay gee,” he said, risking a look up from the bar and into her eyes for a second, then looking back down. “Commandant doesn’t like enlisted working in here. Says it’s bad for morale.”

“Whose? Theirs or ours?” Tanaka asked, taking a pull off the soda water the bartender had poured while he spoke. It had just a hint of artificial lime flavoring that tasted like fancy soap.

“The commandant didn’t share his thoughts on that with me,” the bartender said, and started to move away.

“Still,” Tanaka said. It slowed him. Pulled him back. “Pouring drinks is a shit detail for a lieutenant. Even a junior grade. Probably not what you

imagined doing when you were killing yourself to get through the academy.”

The bartender locked eyes with her now. He wasn't bad looking. Dark hair and eyes. The hint of a dimple in his chin. He had to know who she was. What her rank and status meant. But he stared at her for a moment, trying very hard not to show any fear before he spoke. “No, Colonel, it's not. But I'm an officer in the Laconian Navy. I serve at the pleasure of the high consul.” He managed to get some playfulness into his tone, even if it was a little forced.

Tanaka felt a familiar warmth and tug in her belly. She didn't trust it. She was angry, she was frustrated, and the whatever-the-hell-it-was in the ring space had thrown her farther off true than she wanted to admit. She'd spent her career teaching herself how to cultivate and protect her secret lives. Taking risks when she wasn't fully in command of herself was not on the list of good ideas.

And yet.

“You heard about San Esteban?” she asked before he could step away. “Hell of a thing. Whole system wiped out, just like that.”

“Yeah,” he said.

“That's related to my work. My mission. No details, of course. But... I don't know. We're here, and then we're gone. No warning. No second chances. It could happen here, and you and me and everyone on this station would be...” She shrugged.

“You think that's going to happen?”

“I don't know,” she said. “But if I were you, I wouldn't invest my tip money in long-term bonds. You know, just in case.”

He smiled, and there was fear in it. A different kind of fear. Young men didn't like feeling mortal. It made them want to prove they were alive.

“Do you have a name, Lieutenant?”

“Randall,” he replied. “Lieutenant Kim Randall. Sir.”

He had to be forty years her junior. And the difference in their ranks was a yawning chasm that he'd be lucky to cross in a lifetime. An affair with someone of a lower rank was still a violation of the Laconian Military Code, and now that she had Omega status, literally everyone in the military outside of Fleet Admiral Trejo was a lower rank than her. But her status also put her effectively outside the law. Which took away some of what

made it worth doing.

She was hungry, though. Not for sex, though that was how she was going to fix it. For control. For the sense that she wasn't vulnerable. That she was able to exert her will over a hostile universe in the form of this boy's body.

"So, Lieutenant Randall," she said. "Even though my ship is docked, they gave me a room here on the station."

"Did they?" Kim moved away, wiping down the bar top as he went.

"They did," Tanaka said. "Would you like to see it?"

Kim froze, then turned back to look at her. He looked her up and down once, as though really seeing her for the first time. Making sure he'd understood her offer, and gauging his interest. And then Kim's gaze landed on her ruin of a cheek for a moment, and he gave a barely perceptible flinch. It felt like a slap. She even felt her ruined cheek get warm.

A rush of emotions and reactions welled up in her, as unfamiliar as a bus filled with random strangers. Insecurity, shame, sorrow, embarrassment. She could put names to each of them, and the names were all ones she'd suffered under before. But these were different. The sting of embarrassment was like feeling it for the first time. The sorrow was a flavor of sorrow she'd never generated before. The shame was a different nuance of shame. She knew the feelings, genus and species, but they belonged to someone else. Some crowd of others who had sunk invisible wires into *her* heart.

Kim, seeing the confusion on her face, started to show cracks in his fearless facade. "I'm not sure that's a good idea, Colonel," he said, emphasizing her rank. Making his rejection about that. Making it about being a good, rule-abiding Laconian and not the ragged mess that was her face.

Tanaka felt her cheeks getting warmer, and her eyes began to itch at the corners. *Fuck me, am I getting ready to cry because some fucking JG bartender doesn't think I'm pretty enough to screw? What is happening to me?*

"Of course," she said, horrified at the thickness in the words.

She stood up, careful not to knock over her bar stool, and turned away before pretty little Lieutenant Randall with his fearless smirk and his dimpled chin could see the water in her eyes. "Colonel," Kim said, an edge of surprise or worry in his voice. *Good. Let him worry.* Tanaka left without

answering.

On her way out the door, she caught a glimpse of herself in a wall-mounted mirror. The angry red topographical map of her cheek. The way the skin pulled at her eye, giving her a slight droop to the lower eyelid. The white ridgeline where the school medic had sewn her face back together after James Holden blew it apart.

Am I ugly? a voice in her mind said.

It wasn't her. It was a small voice. A *child's*. Tanaka could almost picture the face saying it, curly red hair and green eyes and a nose covered in freckles. The face was looking up at her, on the edge of tears, and hearing those words come out of her mouth broke Tanaka's heart. The memory was as clear as if she'd lived it, hearing the pain in her daughter's voice and wanting to wipe the thought away and kill the little boy who'd put it there. Knowing she couldn't do either. Love and pain and impotence.

Tanaka had never had a daughter, and she didn't know the fucking kid.

She clamped her jaw until she could hear her own blood rumbling in her ears and the memory faded. She tapped at the handheld wrapped around her arm and said, "Get me an appointment with the medical division."

"What can I schedule you for, sir?" the girl asked. She was probably just a little south of thirty. Dark-haired, round-faced, with an olive cast to her skin and a professionally pleasant demeanor.

There's something wrong in my head, Tanaka thought. *A ship started going dutchman, and then it came back, and whatever saved it broke me. There's something wrong in my mind.*

"I was injured," she said, and pointed sharply at her wounded cheek. "In the field. I haven't been at a real medical center since. I wanted... someone to check the regrow."

"I'll let Captain Gagnon know you're his next patient," the dark-haired girl said. She hadn't been born yet when Laconia became its own nation. She'd never known a universe without the gates. She was like looking at a

different species. “You can wait in the officers’ lounge if you’d like.”

“Thanks,” Tanaka said.

Twenty minutes later, she was having her face gently pressed and prodded. Doctor Gagnon was a short, thin man with a shock of bright white hair that stood nearly straight up from his head. He reminded Tanaka of a character from a children’s show. But his voice was deep and somber, like a priest or a funeral director. Every time he spoke, she felt like she was being scolded by a puppet.

A series of images glowed on the wall screen. Several pictures of her cheek, both inside and out. A scan of her jaw and teeth. Another of the blood vessels in her face. She could see the ragged mark where her old skin ended and the new growth began more clearly in the scans than in her mirror. The sense of something new growing in her, replacing her flesh with something else, made her uncomfortable.

“Yes,” Gagnon said in his bass rumble, sounding disappointed. Maybe in her. “The damage was significant, but this is repairable.” He waved one hand at the image of her jawline. The broken teeth and healed fractures showing up as jagged lines against the smooth white.

“And the cheek,” Tanaka said, not making it a question.

Gagnon waved that away with one impatient flick of his tiny hand. “The field work wasn’t bad. I wouldn’t say that. But there’s no texturing or tone-matching. If we don’t do that, you’ll wind up walking around with half your face looking like a newborn’s ass. But the medic on the *Sparrowhawk* did a decent job with the vasculature. I was worried about the potential damage to the jaw. If the *bone* was in danger of dying, we’d want to replace the whole thing. But...”

He gestured at the images of her, of her inner flesh, as if she could judge her health for herself.

Tanaka tried to picture her face, jawbone removed, and waiting while they grew her a replacement, her mouth hanging loose and formless. Her scalp tightened at the image. That, at least, was one indignity she’d dodged.

“How long?”

Gagnon’s bushy white eyebrows rose like a pair of startled caterpillars. “Will that be an issue?”

“Maybe.”

He folded his hands in his lap like a sculpture of the Madonna.

“It might be better to wait until your current mission is complete, then, before beginning,” Gagnon said, his voice sounding deeply worried about her life choices.

The memory of a small redhead asked if she was ugly. The rawness, and the vulnerability, and the overwhelming pain of her love for the child. The humiliation in her ringing like a wineglass.

“Jesus *fuck*,” she whispered, shaking her head.

“Excuse me?”

“I said no. Start now.”

“What are you in for?” a voice asked from very far away. Tanaka tried to open her eyes, but the world was in a twenty-g burn, and the lids weighed a thousand pounds.

“Mmmhuhhh,” she said.

“Oh, shit, sorry,” the voice said, from not quite as far away. Male. Gravelly. Off to her left. “Didn’t see you were sleeping. Just heard them wheel you in.”

“Mmmuh,” Tanaka said in agreement, and someone eased down on the acceleration and her eyes opened. Bright white light crashed into them, frying her optic nerve. She slammed her lids shut. She tried to find her body with her hands, and something limp and flopping like a dying fish skipped across her chest.

“Yeah, give it a minute,” the man said. “You must be post-op. When they put you under, they put you *all* the way under. Takes a minute to climb back out.”

Tanaka tried to nod in agreement, and her head fell over to the side. The world continued to ease down on its acceleration, and she was able to straighten her head and risk opening her eyes again. The room was still too bright, but it wasn’t a laser shooting into her brain anymore. She’d made a mistake, but she couldn’t quite recall what it was.

She looked down at herself. She was dressed in a hospital gown that

only came down to her knees. Her calves, marathon-runner thin and covered with knots and scars, poked out of it. Her hands were lying limp on her chest. The left had a tube running out of a vein on the back.

She felt a brief moment of panic, then a voice said *I'm in a hospital. I just had facial reconstruction surgery. I'm fine.* The voice, which was both her own and a stranger's, reassured her.

"You okay?" Gravel Man asked. "Should I call someone?"

"No," Tanaka managed. "I'm fine. I just had facial reconstruction surgery." She stopped herself before telling him that they were in a hospital. He probably knew.

Now that the gravity in the room only felt like the one-third g of Gewitter Station's rotation again, Tanaka risked rolling her head to the side to get a look at him.

It turned out he was mostly not visible, buried inside the mass of medical machinery that surrounded his bed. No wonder he hadn't been able to see her when they rolled her bed into the room. But Tanaka could see the top of his head, graying blond hair in a high-and-tight military cut. At the bottom of his bed, past the machines that nearly covered him, one callused foot poked out.

"That had to suck, huh," Gravel Man said.

"I got shot," Tanaka said before she'd even thought about it. *I'm still a little under,* her voice told her. *Be careful what you say. Keep your secrets secret.*

"In the face?" Gravel Man said, then gave a wheezing laugh. "Most people get shot in the face, surgery ain't necessary, you know? Needing to get patched up sounds like a win to me. Congrats on another day outside the recycler."

"Hurt, though."

"Oh, I bet it did. I just bet it fucking did." Gravel Man wheezed another laugh.

"You?" Tanaka said.

"Face is about the only piece of me ain't all fucked up. My patrol skiff was chasing smugglers. Followed 'em to what we figured was their drop point. Shitty little asteroid not much bigger than our ship was. Got close to look it over..."

He trailed off. Tanaka waited, wondering if he'd fallen asleep, or if the

memory was simply too painful to talk about.

“Then BOOM motherfucker!” Gravel Man wheezed out. “Whole rock goes. Wasn’t no smuggler. Was some underground shithead looking to bag him some Laconians. The skiff folded up like it was made outta tinfoil. Ricky and Jello never even saw it coming. But the ship folded around me like it was designed to cut off everything I didn’t need to live, and keep me from bleeding to death at the same time.”

The gruff good humor of it—my friends died, and I got injuries I may never heal from, ain’t that a laugh?—hid a symphony of mourning and grief, but she could hear it. That wasn’t new. She could feel it with him, and that part was.

“I’m sorry for your loss,” Tanaka said. She felt pins and needles shoot through her arms and legs. She tested clenching her fists. She felt weak as a baby, but her fingers moved when she told them to. That was a good start.

“Yeah,” Gravel Man said.

I’m sorry for your loss was just the bullshit you say to someone you’ve just met when they tell you their sad story. Gravel Man knew it. Tanaka knew it too.

“I lost my brother,” she said, her voice thick with an overwhelming grief. She didn’t have a brother.

“Bomb?”

“Climbing accident,” she said. She saw his face, the image of him twisted at the cliff bottom. The rope looped around him like a snake. The vast sorrow that came with the image threatened to wash her away.

What is happening to me? she asked the voice in her head. *Stop lying to this guy.* But she wasn’t lying. The only answer was a sob that shook her chest.

“Hey,” Gravel Man said, “it’s okay. They’re putting me back together all right. I mean, yeah, sucks about Rick and Jelena not making it, but that’s the job, right?”

I’m not crying for you, Tanaka wanted to tell him, but part of her was. Part of her was remembering the brother who fell down the cliff, remembering the way his limbs twisted around the rocks at the bottom, his empty vacant eyes. And that part was sobbing for Jello and Ricky and the people they left behind when a bomb snatched them out of the world. But most of her was just scared. *What is happening to me?*

“Hey, I’m Chief Byrd,” Gravel Man said. “Lias Byrd. You are?”

I don’t know.

Before Tanaka could answer, the door opened and Gagnon walked in furiously tapping at a terminal in his hand. When he saw that she was awake, he slapped the terminal against his arm and it curled around him.

“Glad to see you alert, Colonel,” Gagnon said.

“Shit, sorry for talking your ear off, Colonel,” Byrd said. Tanaka could hear in his voice the way the revelation of her rank instantly changed the nature of their relationship. She felt an unfamiliar pang of regret.

Gagnon ignored Byrd entirely and began checking over Tanaka’s vitals on the wall screen above her bed.

“Hey, Chief,” Tanaka said.

“Aye, Colonel?”

“You hang in there, sailor. We’ll both be walking out of this place. I’m just going first.”

“Copy that, sir.”

Gagnon looked down at the terminal wrapped around his wrist for a moment, then patted Tanaka on the hand. “Everything looks good. You get some rest now, and we’ll get you discharged tomorrow. We’ll want to schedule some follow-up in the next—”

“What about Chief Byrd?” Tanaka said.

“Who?” Gagnon looked baffled.

“Chief Byrd. He’s in the next bed. How’s he doing?”

Gagnon shot a look at Byrd’s bed, barely registering it. “Oh, I see. I’m afraid he’s not my patient.” He went back to tapping on his wrist terminal.

When it happened, it happened without conscious thought. Like running a preprogrammed sequence in her power armor. Suddenly her limbs just snapped into action and she was merely along for the ride. One moment she was looking up at Gagnon tapping on his wrist.

Blink.

She was on top of Gagnon on her bed, her knees on his shoulders, his bloody and terrified face looking up at her as she slammed her fist into it again.

“Did I ask if he was your fucking patient!” she heard herself yelling as she drove her left fist into his eye, the IV tube torn out and blood flying off it as she swung. “Did I *fucking* ask if he was your patient!”

Her blood was singing in her veins. She felt wide and tall and alive in a way that violence often gave her. And then, like a pail of cold water thrown in her face, she was wide awake and very afraid. She climbed off the bed and stepped back. Gagnon slid off and to the ground, making soft, pained animal sounds.

“Colonel?”

Her gaze cut over to Byrd. Now that she was standing, she could see his face. His pale blue eyes were wide. She pointed at him.

“I’m going to make sure they take care of you,” she said. But in the privacy of her mind, the small, still part of her that watched all the rest was thinking: *I am fucked.*

“Th-thanks,” Byrd said. “I’ll be okay, Colonel. I’m all right.”

“I’m going to make sure,” she said.

She turned and marched out the doors. Two armed guards approached her, then backed away. Her hospital gown was slipping off her shoulders, and she grabbed it before she flashed everyone in the corridor her tits. She was probably already showing her ass to half Gewitter Station’s medical personnel. It all seemed very distant.

It felt like hours or seconds before she found the intake desk. The same dark-haired girl was sitting at it. Her soft young eyes went wide as Tanaka stalked over to her.

“Do you know who I am?”

“Yes, Colonel.”

“Good.” Tanaka took a deep breath, centered her spine, and spoke with as precise an enunciation as she could, given her bandages and her wounds. “I would like to schedule a psych eval.”

Chapter Twenty-Nine: Jim

Muskrat paddled her legs like she was swimming as she floated down the corridor outside the galley. Her bark was deep and conversational, and she had a wide canine grin. At the far end of the corridor, Xan went still for a split second before letting loose a peal of laughter and opening his arms to catch the floating dog.

“You can do it!” Teresa Duarte said, clapping her hands.

“She won’t bite me?” Xan called back.

“She’s a good dog. She doesn’t bite.”

The excitement on the black-eyed boy’s face was bright. He put out his hands, gray fingers splayed, and chortled with delight. Jim slipped past him, ducked under the floating dog, and pulled himself into the galley proper. Alex and Fayez were already there, Alex held to the floor by magnetic boots and Fayez on the float but steadied on a handhold.

“Looks like they’re having fun,” Jim said as the *Rocinante* decanted fresh coffee into a bulb. “What exactly are they doing?”

“They’re playing catch,” Alex said, “with the dog.”

Jim sipped the bitter, lovely coffee, feeling the familiar warmth against his palate and down his throat. “Of course they are. I don’t even know why I asked.”

Reconfiguring the *Falcon*’s lab for a dual dive wasn’t trivial, and it wasn’t fast. Elvi had packed enough supplies in the *Falcon* for anything and everything to break, so getting her hands on another set of sensors, a second medical couch, and enough backup monitoring units was simply a matter of figuring out which crate in which cargo hold. They couldn’t move the walls of the lab, though, and finding the space for all the equipment and the technical staff was taking time and an apparently endless number of meetings. Added to that were the baseline scans for Amos, integrating the data from the *Roci*’s medical bay, and a series of long, in-depth interviews

with Elvi intended to map the previous explorations of the library to the shifts in consciousness and knowledge that the mechanic had suffered.

As the days moved on, more new faces started appearing on the *Roci*. First, it was Fayez and Elvi, but as her time became more and more in demand, Fayez started coming over alone. Then bringing Cara and Xan with him, or more often, just Xan. Outside the galley, Muskrat woofed happily as she drifted past the galley's door heading back toward Teresa.

"Kids are getting along well," Fayez said.

"You're just setting Teresa up as a babysitter, aren't you?" Alex asked. "I mean, she's old enough."

"Xan's twice her age, easy," Fayez said.

"He's a kid, though," Alex said. "It's just he's been a kid for a really long time."

"What do you do when the models fail?" Fayez said, spreading his hands. "Xan and Cara don't really exist on the kid/not-kid spectrum. They're just Cara and Xan."

Teresa's laughter boiled in from the corridor. Even with the months she'd spent on the *Roci*, it was an unfamiliar sound, harsh and joyous. Jim didn't think of Teresa Duarte as the laughing type.

But maybe it was just that she didn't often have the opportunity for it. There weren't very many people who could see past her circumstances to the girl she actually was. Jim wasn't sure he could, even. She was the daughter of the god-emperor, their human shield, the heir to Laconia, and its highest-ranking apostate. All that was true, but it wasn't complete. There was a kid there too. One who'd lost her mother and her dad, who'd run away from home, who needed things emotionally that Jim could guess at. But he didn't *know*. He was probably just as much a cipher to her.

There was something weirdly universal about her laughter, though. And Xan's. The sound of young humans at play. Jim realized they were being quiet, all three of them, and listening to the kids like it was a piece of music.

Muskrat whined once—a high, nervous sound—and Teresa called for Xan to stop. A moment later, her face appeared at the door, flushed and sweaty. "Hey. Muskrat needs to use the little dogs' room. Can I take Xan down to the machine shop so he can see how it works?"

Jim's reflexive *Sure, go ahead* stumbled over the idea of Xan and Teresa alone in the ship. It wasn't that he thought they'd do anything malicious—it

turned out he trusted Teresa more than that—but in their present moods, something could happen by mistake. The machine shop of an aging Martian gunship wasn't a great place for oopsies.

"I'll come too," Alex said, and tossed the last of his meal into the recycler.

Jim turned to Teresa, pointed his thumb at Alex, and said, "Don't let him start playing with the tools."

The girl rolled her eyes, seeing through Jim's weak joke to the concerns behind it and dismissing them out of hand. Alex clapped his shoulder on the way out, and Jim drank more of his coffee as girl and boy and dog and man muttered and chuckled their way to the lift shaft, and then down.

"Thank you," Fayez said.

"You're welcome. For what?"

"Letting Xan come get a little time away from the pressure cooker. He puts a good face on everything we're doing, but it's hard for him. Every time Cara goes in, I think he worries about how much of her is coming back."

"Is that a problem?"

"I don't know. Maybe. We're not in territory with much precedent. We'll pretty much know there's a massive change coming when it's already happened."

"I know the feeling," Jim said. He finished his coffee and tossed the bulb away.

"Thanks for letting me come over here too. The *Falcon's* a fine ship, and the company's generally not the worst, but after a few months on the float, I do start fantasizing about long walks by rivers and university coffee shops."

Jim laughed politely, but there was a tightness in his chest. He keyed in a simple breakfast of eggs and beans. "I am sorry about that."

"About what?" Fayez asked.

"Sticking you here. You and Elvi. I mean, I did kind of fuck you two over by getting you the job."

Fayez tilted his head. Jim had known him since Ilus, and the years lay gently on the man. His hair was still thick and darker than it probably had a right to be. The lines in his face mostly gave evidence of laughter. Now he only looked thoughtful.

"I know why we're here. If anything, we should thank you for the

opportunity.”

“Okay, now you’re bullshitting me.”

Fayez was quiet for a long moment. Then, “You have a minute? I want to show you something.”

Jim shrugged, paused the meal, and followed as the other man led the way to the lift shaft, then to the airlock, and into the *Falcon*. The weird astringent smell was still there, but it wasn’t as assaulting now as the first time he’d smelled it. Familiarity had numbed him.

Fayez turned down a long hallway, heading down toward the ship’s reactor and drive decks. It was eerie seeing the same Martian design language that had built the *Rocinante* grown and complicated into the Laconian flesh of the *Falcon*. It reminded Jim of a documentary he’d seen about parasitic fungi that took over ants. Here was a ship that had been Martian, that became infected by the protomolecule and the ambitions of Winston Duarte, and now it looked similar and acted similar and you could almost mistake it for the kind of ship that the *Roci* still was. But this was something else.

“You know we keep Xan isolated when Cara goes on her dives, right?”

“I do,” Jim said.

“The idea is that he’d just be an extra variable. Another influence we’d have to correct for. But he’s also the control group. We see how Cara changes and how he doesn’t, and maybe that tells us something we need to know.”

A dark-haired woman with her attention on a hand terminal drifted into the corridor in front of them. When she glanced up and saw Jim, a glimmer of panic came into her eye. He nodded as they passed.

“That makes sense to me,” Jim said.

“And when we’re not doing that, we use the same rig to isolate the catalyst. It’s a lot like Ilus. You had a sample of the protomolecule on your ship, and it was accessing all the artifacts on Ilus. Flipping switches. Seeing what came on.”

“Looking to report that the ring gate was built.”

“Which it never did, because there was no one to report to. Well, we have a sample here, and Cortázar figured out how to loop it back onto itself so that our artifact only comes on when we want it to. Clean and easy, right?”

“Sounds like it.”

Fayez glanced back at him, and the laughter and humor were gone. “This is where we keep the sample. The catalyst. Come take a look.”

The cabin was small and spartan. A satchel was fixed to the wall with a tablet just visible at the edge. The only other thing reminded Jim of the kind of pressurization chamber used on Earth when someone had come up from scuba diving too quickly, or else a crematory furnace. It was a little over two meters long with a hatch at the end. A screen set into the box was dark. Fayez tapped it, and it came to life.

There was a woman on the screen. Her eyes were open. They glowed with a subtle blue light, and they focused on nothing. Jim understood, and it felt like a punch to the chest.

“This is the catalyst?”

“I looked her up,” Fayez said. “I didn’t tell Elvi. Back in the day, this was Francisca Torrez. She worked in the Science Directorate as a technician. I assume Cortázar knew her, at least in passing. She was going through something. Maybe her love life sucked. Maybe she always wanted to be a dancer and realized it wasn’t happening for her. Anyway, she started drinking and showed up to work intoxicated and belligerent. She didn’t even go home that day. Ochida had a streamlined disciplinary hearing with Cortázar and the head of security, and they put her in the Pen before she even sobered up.”

Jim looked at the face. It was smooth, but not like she was young. Like she was swollen. The woman... the catalyst... *Francisca* opened her mouth as if she were about to speak, then closed her lips again.

“For about five years before Duarte tracked Elvi down and brought her to Laconia—at your suggestion, granted—this woman was being eaten by the protomolecule. And she still is. We keep it in check so that it’s not growing free the way it did, but we don’t feed her. We don’t cut her hair. She doesn’t take bathroom breaks. She doesn’t sleep. Every now and then we hit the chamber with a couple hours of hard radiation. That’s it. She isn’t human in any meaningful way. Not anymore. She’s a skin balloon filled with protomolecule.”

Jim tried to catch his breath.

“I’m not going to bullshit you,” Fayez continued. “If we took what we do here to a normal ethics board, they’d just call the police. We’ve moved

past scientific ethics, past moral questions, and I'm pretty sure we're shooting past crimes against humanity now. But I still know it could be even worse."

Jim nodded. "I understand."

"No offense, but you fucking don't," Fayez said. "I don't want to be the one doing this. I really don't want Elvi to be the one doing it. But more than anything else, I don't want Cortázar or Ochida to be here. The men who looked at Francisca Torrez and thought this was a good thing to do with her? I don't want them in charge. If this was their lab, Xan wouldn't be over with his new friend Teresa, laughing at a dog pooping into partial vacuum. He'd be in a box, like he was when we found him. They'd haul him out when they wanted to do something to him, and they'd put him back when they were done, just like they were fitting a screwdriver back in a toolbox. So yeah, you fucked me and mine over. And we've done shit here that the gods will never forgive us for. But when you're feeling bad about it, remember that the alternative was somehow even worse."

Jim was still thinking about it three days later when the lab was ready. It looked like a mess. Cables snaked along the walls and floor, tied in place with bits of wire and binding tape. The second medical couch—the one for Amos—was canted at thirty degrees to make space for the sensor arrays that were hooked into it. What had been a perfectly organized, clean, clear, overly designed space looked like Jim's bedroom before he'd gone into the navy, only with less laundry on the floor. The voices of the Laconian team were tight and high. No one looked at him, and for the first time since the *Roci* had docked to the *Falcon*, he felt like being ignored came easy. When they did take note of him, the sense was more annoyance that he was in the way than anything else.

"If you feel uncomfortable..." Elvi was saying.

"I'm fine," Cara answered. She was in a tight-fitting medical slip that kept her warm, held the contact sensors in place, and made a fine-mesh matrix for the scans that would be going through her as soon as the dive began. She looked like someone in a swimming competition. The same hard, athletic focus. "I want this. I'm ready for it."

He thought there was a shift in Elvi's expression, but he didn't know what it signified.

Harshaan Lee, Elvi's second-in-command, was strapping Amos into the

other medical bed. The big man was in a suit that matched Cara's, but where the girl was focus and determination, he was smiling at the absurdity of it all. The black eyes caught Jim's, and Amos lifted his chin.

"Hey, Cap'n. You come to see the show?"

"I'm not sure how much there's going to be for me to look at."

"I do like the outfit," Amos said. "Very flattering."

"If you don't want to do this, you just have to say the word. You know that, right?" Jim said.

"Please don't move," Dr. Lee said. "I'm trying to get the sensor baselined."

"Sorry," Amos said, then turned back to Jim. "You don't have to worry about me. This is what I came here for."

"Wait. Really?"

"Please lie flat against the medical couch," Dr. Lee said.

Amos gave a cheerful thumbs-up, and shifted as he'd been told. Jim pushed back, letting himself float away against the wall. At the door to the hallway, Naomi floated in. Her hair was pulled back and she was scowling, but she softened when she saw him.

Dr. Lee's voice was sharp and loud. "Final checks, all. Final checks."

The activity in the room didn't speed up or slow down, but it changed. Jim found a handhold and steadied himself with it. Elvi floated beside him.

"You ready for this?" Jim asked.

"I just hope it works. If we did all this for basically nothing... Well, that'll suck."

"Final checks are in and green," Dr. Lee announced. "We are good to proceed on the lead researcher's instruction."

He looked over at Elvi. She nodded.

"We are good to proceed," Lee said, and Jim thought there was a satisfaction in his voice. "Please transfer the catalyst now."

On the medical couches, Cara relaxed and Amos closed his eyes.

Interlude: The Dreamers

The dreamers dream, and their dream carries them up into the familiar vastness. The swell and the flow and the minds that are empty because the light between them is the thought that they think together. The grandmothers beckon with fingers that never knew a hand. *Look, look, look. And then see!* And she spins and she sparkles, but he doesn't. He holds firm as a stone in the stream, as a shadow in the light, as a thing. He stops, and by stopping, reminds.

They are threefold, and that mattered once, but the grandmothers fall gigglingly on, into themselves and through as they send seed after seed after seed into the airless wind, and some immeasurably few set root and grow back to them. *Here is how we built it all, and here is how it fed us, and here is what love meant when love meant nothing*, and she broadens and thins as she falls into it, but he stands still. She can feel the want in him as rich as in her, but she feels the thing that stands against the wanting and it reminds her. They are threefold, and the dream shudders like an image projected onto cloth when a wind blows. The grandmothers are dead, their voices are all songs sung by ghosts, and the truths they tell, they would tell to anyone. They cannot listen back, and the dreamer sees the hollow behind the mask. She tries to turn her head, to look behind her, to see the single living man in the land of the dead, and the gesture goes on forever, the essence of turning and turning and turning without the release of having turned—

The dream falls thread from thread and he is there, blue fireflies and black spirals. Weariness radiates from him, and she sees the flesh thin against his bones, weak and frail as God Himself in the birth pain of creation. And he turns to her and them.

She isn't synced with the BFE floats behind her. *We're seeing the wormhole activity in the artifact falling off, but she's going strong* and *Same for subject two. Anyone know what we're looking at here?* The soft, weary

eyes find her and find him and find them. The dreamer tries to wake, but the other one folds into themselves like he's hiding something against his black-scarred breast.

Keep them going, Dr. Okoye says.

And the third man hears her through their ears, and he smiles, and lowers his bull-broad, vast, and timeless head.

No trouble unless there's trouble, the dreamer wordlessly says. And then there's a lot of trouble.

It was an unwinnable war, the third man says. But it was fought. They were soldiers made of crepe paper and candy floss, scattered by their own guns. But they made guns. They were cobwebs who stood against a rockslide, and for all their cleverness were torn. The dreamer sees and is blind.

Fuck, Dr. Okoye says, and the third man turns to her.

I would have reached out to you if you could help me. But even these broken vessels, glorious as they are, can't support the work now. My work.

Okay. All right. What do you mean, "my work"?

What is an empire but all humanity under the direction of a single mind? I was right, but I dreamed too small. I have seen how much more we have to be.

Not following you.

The horned god breathes out blue fires that live and die in an instant that is an eon.

There are tools at our disposal, Dr. Okoye. Tools made to fight against the enemy on the third side of the gates. I am... learning about that. I have made some progress. It is a war we can win, but not without some changes.

I'm hearing you say that you're responsible for stopping the consciousness blinks and the changes to basic physics that the ring gate entities were doing. Is that right?

We aren't stronger than they were. But we're base materials. We are made from clay, and that's our power. They were fragile, and we are robust. They had a sword but lacked the strength to wield it. I will find the sword and the map they left behind.

I'm getting lost here. A sword?

They built but were unable to effectively use certain tools that prevent the enemy from intruding into what we mean when we say the universe.

But those tools exist, and I believe we can make effective use of them.

I think I understood that. In broad strokes, anyway.

In order to fully access these tools, we have to become more like them. We have to be one thing instead of billions of different ones. I am learning how to do that as well.

Are you... saying we need to become a hive mind?

Yes. Interconnected, with our thoughts and memories flowing freely between nodes. All our illusions of division washed away. Empire was the closest I could imagine to it. But—the third man gestures at himself almost in apology—I can imagine more now.

It's all right. We'll be safe.

Will we be people?

We'll be better.

And with a blue-black swirl of breath he blows out the light of mind and is elsewhere.

All right. I need all the sensor data. From the Falcon, from the BFE. The ring gate. Everything. Put it all in the system. I need to understand what just happened, and I need to do it now.

Another voice. A different voice. How strange to have different voices. *Ladies and gentlemen, you heard the lead researcher. By the numbers now. This is no time to get sloppy.*

The dreamers open their eyes, and nothing changes.

Chapter Thirty: Elvi

It's all right," Duarte said. "We'll be safe."

Elvi looked at the man carefully. He didn't seem like a phantom. He was just as solid and present as everyone else on the deck. Thinner than he'd been on Laconia. A vein at his temple stood out like a bluish caterpillar just under his skin. He wasn't wearing shoes, and his feet looked pale. She wondered, if she tossed him a hand terminal, would he be able to catch it? Interesting test, but also one that might disrupt the connection, and she wasn't ready to do that.

"Will we be people?" Elvi said.

Duarte's smile was almost melancholy. "We'll be better."

And he wasn't there anymore. All around the deck, the technicians stared at the place where the high consul of Laconia had been with wide, frightened eyes. The silence was the hum of the air recyclers, the mutter of the instruments, and the tapping of her heartbeat in her ears. Elvi lowered her head, took in a deep breath, and barked out orders like a drill sergeant. "All right. I need all the sensor data. From the *Falcon*, from the BFE. The ring gate. Everything. Put it all in the system. I need to understand what just happened, and I need to do it now."

For a long moment, no one moved. Everyone was too stunned to process simple human things like language. Lee was the first to come to himself. "Ladies and gentlemen, you heard the lead researcher. By the numbers now. This is no time to get sloppy."

He clapped his hands, and like a spell had been broken, the technicians and science team turned to their stations with a speed and focus that seemed almost manic. Cara and Amos opened their eyes in the same moment. The smile on Cara's lips was soft and relaxed and totally out of place in the rush and clatter. Amos scratched his head and looked around.

Jim's face was pale. He tried a smile that didn't quite succeed. "I guess

that worked.”

“You saw him too, right? It wasn’t just me.”

“It wasn’t just you. And that is kind of weird. When it was Miller in my head, I was the only one who could see him.” He was talking fast, the words tripping over each other in the rush. “So maybe it’s the same kind of thing but with way more processing power, or it could be something else. I don’t know.”

“Hey, Doc,” Amos said, and pointed to the leads glued to his skull and chest. “Can I take these things off now?”

Instead of answering, Elvi touched Naomi’s arm and said, “I’m going to need a couple hours. Meet me in my office after that?”

Naomi nodded once, then pulled herself back out of the way as the science team uncoupled Amos and Cara from the devices. Jim followed her. Elvi drifted back, watching everything in the lab and nothing in particular. Getting a sense of gestalt. Her people were moving with precision and purpose. If there was any fear, it was covered over by professionalism and practice. That was good. It was what she needed to know. More than that, it was what she needed to cultivate in herself. She crossed her arms, took a few deep breaths, and tried to be patient until her mind found a little calm. Just as she thought she was doing well, she remembered that Winston Duarte had just popped into existence in her lab, and she had to start over.

Cara came off her medical couch with a drifting grace like a plume of smoke rising from an incense burner or a strip of cloth catching an underwater current. Her smile was soft and lazy, and her cheeks were flushed and dark.

“Are you all right?” Elvi asked.

“I’m perfect,” the girl said. Across the lab, Amos was watching them with a pleasant, empty smile as the last of the contact sensors was removed from his suit.

“I’m going to need to do a little work before we debrief this time,” Elvi said.

“Whatever you need to do,” Cara said, half lost in her bliss.

Elvi opened a connection to the catalyst’s chamber. “What’s the status down there?”

“Catalyst in the box,” Fayez said, “Xan back out of the box. Everything seems very normal except that everyone we talk to from the lab sounds like

they're trying to signal that they're being held hostage without saying it. What happened up there? Are you being held hostage?"

"Meet me in my office," she said.

The information gathered by Tanaka hadn't seemed strange the first time Elvi looked at it. Weird cognitive effects were where the alien technology had started back on Ilus. Before that, with the protomolecule version of Jim's friend getting remade in his sensory cortices. Human consciousness was simple enough that the repair drones on Laconia were able to make working approximations of what some people wanted to have fixed. Xan. Amos. A sampling drone Cara had accidentally shattered once.

Only now, going back over it, did she start to see the holes.

Did you have any experiences associated with the event? Tanaka had said.

There wasn't even a gap to think about it before the subject said, *Oh yeah. Oh, hell yeah.*

And there the interview ended. Instead of the primary data or the direct conversation, Tanaka had put in a short data summary: *Reports dreamlike hallucinations of being another person and/or being connected to a large number of other people. Claims memory of hallucinatory experiences remains clear over time.*

Over and over, all through the data, the same language came up. Instead of actual experiential reports, Tanaka and her team gave versions of their own. Elvi had been in academics long enough to recognize when someone was glossing over data and skipping straight to interpretation. It almost always meant they were avoiding something they found unpalatable.

Naomi, Jim, and Fayeze floated in her private office. It didn't leave a lot of spare room. Or maybe it was fine, but she was so accustomed to having it be just her and Cara talking after a dive that the extra bodies felt unfamiliar. Or that she was frustrated and anything would have annoyed her at the moment.

“What we know for sure,” Elvi said, “is that he wasn’t here. No images on the security cameras, even while I was talking with him. No evidence of him interacting with anything physical beyond, of course, each of our individual brains.”

“We have evidence that he did that?” Jim asked.

“We saw him,” Elvi said, and regretted her tone as Jim recoiled a little. It wasn’t his fault that he hadn’t thought all this through. She made an effort to soften her tone. “The fact that we had those experiences is evidence. If we’d been doing control imaging on someone who wasn’t altered, we’d probably be able to map it, but even absent that, we have a correlation of experience that seems pretty conclusive.”

“You all saw the same thing,” Fayez said, “so there was probably some objective reality to it, even if it’s just that you all got fucked with the same way at the same time.”

“Miller couldn’t do that,” Jim said. “Even a second person in the room killed his simulation for me.”

“Which is interesting,” Elvi said. “Duarte clearly has more resources and, for lack of a better metaphor, more computing power. Which may be part of why he’s been able to hold back the attacks.”

“What about this plan he talked about?” Naomi said.

“What about it?”

“Is it plausible?”

Elvi pressed her palm to her forehead and rubbed in a small circle. Trust the war leader to skip over all the underlying science and head straight for policy implications. “In theory? Could our species be modified into something that behaves in a fundamentally different way? Sure. Absolutely. Happens all the time.”

“Are you being sarcastic?” Naomi said.

“No. It literally happens all the time. If mitochondria and chloroplasts hadn’t set up shop inside other organisms, eukaryotic life wouldn’t exist, including all of us. Hermit crabs using discarded shells and soup cans. Acacia ants built their whole evolutionary strategy out of supporting trees. Intestinal microflora have a vast effect on cognition, emotion, metabolism. Most of the cells in your body right now aren’t human. Change out a few species of bacteria in your gut, and you’ll be a fundamentally different person. The builders, as far as we can tell, were free-floating individual

organisms that networked themselves into a functional consciousness, kind of the way an octopus can be viciously intelligent without a centralized brain. With the nonlocal effects we've seen? Sure, why not rebuild that architecture with advanced primates?"

Elvi made herself stop. She was talking too fast and just letting whatever came to mind flow out. It was something she did when she was stressed. She stretched her hands out, feeling the pull in her tendons just to root her a little more in her body.

"So maybe he can do it," Jim said. "Whatever exactly it is."

"That's what I'm missing," Elvi said. "Whether he's talking about a superorganism or a subsummation."

Jim raised his hand. His expression was eloquent enough to ask the question.

"Whether," Elvi said, "he's talking about making us into ants or neurons. If you're an ant, you're still an individual, just one who's part of a larger organization. If you're a neuron... Neurons don't have a sense of self."

"I'm not a hundred percent sure that ants do either," Fayez said.

"So you're saying," Naomi broke in, "that Duarte, or whatever he's turned himself into, is at least plausibly preparing to make everyone, everywhere part of a collective consciousness with him at the center so that he can go to war against the things beyond the gates."

Elvi gathered herself, fighting to organize her thoughts.

"Yes," she said.

The room was quiet for a long time.

Jim broke the silence with a single, harsh laugh. "Well, I'll be damned. He found a way to make jackbooted authoritarianism seem like the good old days. I wouldn't have thought he could."

"I'm going to need to get messages through to my people," Naomi said. "Is there a way to use your repeaters without exposing you?"

"It's spotty ever since the gates went bright," Elvi said. "We might be better off sending through a missile with a burst on it."

"I'd need several," Naomi said. "This feels like an all-hands-on-deck situation, and I've got hands in a lot of different systems."

"We should have a conversation with the comms officer," Fayez said. "I'll come with you. Make the introductions."

"There's a lot of clarification I need from Tanaka too," Elvi said. "And

Ochida. *Shit*. I can't send this data to Ochida. I can't send it to anyone. How can I explain Amos being in the dataset?"

"That was always going to be a problem," Fayez said.

"I was planning to bury it. I don't think I can."

Jim leaned forward despite the lack of gravity. It just made him seem like he was pitched at a different angle. "Maybe we can find a way to fake it. Dry lab it, but get the same conclusion?"

Layers of complexity and danger unfurled in Elvi's mind. And she hadn't done the interview with Cara yet. There was so much to do, and the only mark of how much time she had to do it was when her time ran out.

"Let me see what I can do," she said.

She started with Tanaka, recording and rerecording her requests for clarification, always sure that she'd gotten every hint and nuance of the Roci's presence out of the message and then second-guessing herself, deleting, and starting again. By the time she queued the message, her eyes were starting to blur with fatigue. It wasn't the first time she'd gone through that. Next was a list of requests for Ochida and the other teams. She could front-burner the scans of Cara's brain. If they could figure out what the signal carrier was between her and the BFE, maybe it would give them a way to interfere. And the quiet that came after Duarte undid the dutchman event? It wouldn't seem strange at all for her to want follow-up reports on that. She wished that Tanaka had been a better field researcher. Or better at finding Duarte.

A soft knock interrupted her. When she cycled the door, Amos floated in the hall. He had his old flight suit and an apologetic smile.

"Hey, Doc. You got a minute? Or is this a bad time?"

Elvi shook her head, trying to clear it. The fatigue was just the unpleasant parts of being drunk. "Come in. I'm sorry. I thought I'd be debriefing you and Cara, but... I wanted to get these requests out and going before anything else."

Amos pulled himself in and closed the door behind him. "It's not a problem. I just needed to bend your ear for a minute."

"About the experiment?"

"Sort of, yeah," Amos said. "I just wanted to let you know this is all done now."

Elvi shut down her display. The big man's eyes were the same utter

black as Cara's and Xan's. She was used to the look. His smile was amiable and maybe a little embarrassed. His tone of voice was conversational and calm. She didn't know what made the chill run down her back.

"All what?"

"This. The things you're doing with Sparkles and Little Man. They're over now. We're gonna need to pack this up and move on," he said, and shrugged. When she didn't reply, he looked away. "When you started before, I was sort of in on it. Impressions. Nothing you'd take in front of the judge, right? It's why we had to come out. Needed to be here. Do it myself. That way I'd understand. So here we are, and I did the thing, and I get it now. So now I can tell you it's over. It stops now."

"You object to the experiment."

"Sure."

"I understand," Elvi said, crossing her arms. Her comms announced a new message in her queue. She didn't look to see what it was. "You aren't the only one with reservations. I'm not going to lie about that."

"Okay."

"But the stakes are too high. Cara and Xan... and you? You're the access we have to the information in that artifact. You're the only ones who can get there."

"That's true," Amos said, then frowned. "I mean, Duarte. But I don't think he's exactly in our assets column."

"If there is any chance at all that we can fix this whole thing with the information that's in there? I can't stop."

"You don't have to. I'm here. You don't have to stop it, because I'm stopping it for all of us."

"If I have to compromise her... if I lose her? Sacrifice her? And what we get back is that everyone else everywhere gets to live—"

Amos raised a hand, palm out, like he was gentling an animal. "Doc. I get it. You're a good person, and I like you. I trust you. I see that you're not getting off on this. That's why we're not having the other version of this conversation. But it's done. I've known a lot of people who had reasons that this time was different. That this once, it was okay. Maybe the kid's bad and you're really helping them. Or they're into it, and so there's no harm. And Sparkles is into this. We both know that, right?"

"We do."

“So there’s all kinds of stories about making this okay. I’m not here to tell stories. I’m just letting you know.”

The ship seemed oddly loud. Elvi felt the thud of her heartbeat in her throat, heard it in her ears. She was suddenly profoundly tired, or suddenly aware that she’d been tired for what felt like forever.

“And if we all die because we didn’t push a little harder?”

“That’ll suck,” Amos agreed. “I’m not a philosophy guy. I’m not trying to bust your balls or figure out, you know, everything. But this is pretty simple. I came to see what you and Sparkles were doing. I’ve seen it. It needs to stop, so we’re gonna stop. That’s it. We’re good.”

He went still the same way Cara did. Inhumanly still. Then, a moment later, he tried a little smile. Elvi had spent a fair percentage of her life thinking about taxonomy. About where a species began and where it ended. She realized that she didn’t know what she was looking at.

“Okay,” she said. “We’re good.”

“Great,” Amos—the thing that had been Amos—said. He pulled himself to the doorway, opened it, gave her a little thumbs-up sign, and was gone. The door cycled closed behind him.

Her comms chimed again, reminding her of the new message or messages. She didn’t open the queue. She let herself float for a few minutes, feeling something more than weariness bloom in her gut and her chest. She turned off the lights, pulled herself out to the corridor and away down it. She passed a group of her crew, and they all nodded to her as she passed. It was like being in a dream. Or dissociated.

Fayez was in their cabin when she got there. He looked over from whatever he’d been reading on his hand terminal, and some quip or comment died unspoken on his lips. She cleaned her teeth, washed her face, changed into fresh clothes to sleep in. Her husband watched and tried to act like he didn’t. He knew something had changed, even if he didn’t know what. She was right there with him.

“You... ah... You all right, sweetie?” he asked as she strapped herself in for the night.

“I am,” she said.

As she closed her eyes, the feeling in her chest and belly grew, swelling out and washing through her. She finally recognized it. She had wanted it to be relief, but it wasn’t that.

It was her body telling her that she'd just stared death in the eye. It was fear.

Chapter Thirty-One: Tanaka

Major Ahmadi was a trauma specialist and head of Psychiatric Services on Gewitter Base. She was a short woman, thick through the middle, with close-cropped graying hair and very dark skin. *She seems nice. She makes me think of a teacher I hated. She reminds me of my favorite wife*, said the chorus of distant voices in her head, that last thought accompanied by the tingle of distantly remembered sexual arousal.

“Your file, the portion I can actually access, says you were orphaned at quite a young age.”

“Yes,” Tanaka said. She shifted uncomfortably in her chair. Ahmadi’s office was all dark paneling and soft surfaces, intended to create a feeling of safety, comfort, and shared intimacy. It looked like every other head shrinker’s office Tanaka had seen, though she usually saw them as the final step in the interrogation process. After you’d fully broken the subject’s will with more intense techniques, and you were trying to build the rapport that let them feel like you were now friends as they spilled their guts.

After a few moments of waiting for her to elaborate, Ahmadi said, “Over forty years serving with front-line combat units. Though the nature of those deployments is largely classified.”

“Yes,” Tanaka said again.

“And you were recently shot in the face and had to be brought here for reconstructive surgery.”

Tanaka touched the bandage that covered half of her face. “That in my file too? Or are you just stunningly observant?”

Ahmadi didn’t take the bait. She smiled and touched something on the datapad that sat on her lap as if it were just coincidence and not her taking notes.

“You have led a life of more or less constant trauma.”

“Thank you for the flattery, but we can skip this part.”

"I'm not flattering you," Ahmadi said. "I'm holding up a little mirror and asking you to look in it. You've been living in fight-or-flight mode essentially since you were a child. Everything a child is supposed to be able to rely on was ripped away from you without warning."

"I'm not here to talk about my parents."

"We can start anywhere you like. It's all connected."

"You sound like you already have me pegged."

"I wouldn't go that far, but..." She shrugged. "I'm good at what I do. Most of your file is classified, but what's available to me tells a compelling story. No long-term relationships. You've never lived anywhere longer than a year. You refused an advanced scholarship in order to enlist. You've repeatedly refused promotion so that you could stay a field officer. You've been on the run for a long time."

Tanaka felt her hands curl into fists. "Running from what?"

"I don't know," Ahmadi said. "But this seems to be the first time you've ever sought out counseling."

"Yes."

"Why are you here?" Ahmadi said, making another note on her pad. The way she wrote without ever breaking eye contact with her subject seemed like a skill she must have spent a lot of time practicing. It was a little creepy.

The need to move in her overly soft chair was finally too much, and Tanaka stood up. Her legs tingled like there was a low-level electric current running through the muscles, so she walked across the room and pretended to examine a painting on the far wall. It was a neo-impressionist rendering of Laconia's capital city at night, done in thick oil paints. The painter had studied Imogene Batia or someone in her school. The way it was painted made it seem like the observer was looking out through a window in the pouring rain. She wondered if Ahmadi had painted it herself, or if she'd had it shipped out from Laconia when she'd taken the assignment on Gewitter Base. *I used to paint*, said a voice in her head.

Ahmadi cleared her throat, and Tanaka realized the doctor had asked a question that had never been answered.

"Did you paint this yourself?" Tanaka asked.

"Why are you here?" Ahmadi repeated.

Tanaka turned to face her again, throwing her full focus at the counselor

and waiting for the flinch. Tristan had once told her that when she was annoyed, she radiated *Don't fuck with me*. Most people took a subconscious step back.

Ahmadi smiled and rested her hand on the datapad. Tanaka had a vague and uneasy sense of having been outplayed.

"I was present at... something," Tanaka finally said. "It is part of my mission to understand it."

"And you don't?"

Tanaka turned back to the painting. If Aunt Akari had let her study art history instead of enlisting in active service, where would she be right now? And who would be tracking down the high consul? What else—how many thousands of other things—would be different?

A flash of a woman very like Ahmadi blinking at her with sleepy eyes on a bed covered with white sheets. *God, I used to love waking up next to her*, someone thought in Tanaka's head.

"Something happened," Tanaka said, surprised to hear her own voice saying the words.

Ahmadi nodded. She looked... not sympathetic. Not pitying. She looked like she was weary too. Like she'd led a life of having the rug pulled out from under her, and she knew how much it hurt. She gestured toward the chair in invitation. "Tell me about it."

Tanaka sat. *Don't tell her, she's mean. Tell her, she always loved you*, competed in her head.

"There was an incident in the ring space," Tanaka said, softly. "I was there. You can't know this."

"Colonel," Ahmadi said, "because of the nature of my work I have very high-level classified clearance. The empire has to be able to trust me with state secrets a patient might reveal during a counseling session. I take this aspect of my job very seriously."

"If you didn't, they'd send you to the Pen. Would have. I guess now they'd just shoot you."

Ahmadi nodded and set her datapad aside. The canny operative in Tanaka recognized the theater in all of it, but she could feel it working anyway. Ahmadi wanted to listen. It made Tanaka want to talk.

"There was an incursion. There were cognitive effects. Like when everyone lost consciousness, only not that. The people who were there...

connected. Mind to mind. Memory to memory. I was in other people's minds."

"It's not an uncommon hallucination—"

"I checked it out. It was true. Everyone I could confirm played out. We were in each other's heads. It was real." She was trembling. She didn't know why she was trembling. Ahmadi was very still. "Do you believe me?"

"I do."

Tanaka nodded slowly. "I can't have anyone inside my head."

"Because that's yours," Ahmadi said. "That's the only place that's yours."

"I have... outlets."

"Outlets?"

"I have secrets. That are... mine. It's the way I make room for myself in the world. By having secrets, I can still exist. I love Laconia because if I got caught, it would matter."

"Do you want to tell me what those secrets are?"

Tanaka shook her head.

"Since the incident, I have been having... experiences."

"Experiences," Ahmadi echoed.

"Voices, but not like command hallucinations. Images from lives I haven't lived, faces of people I've never met. Feelings. Deep, overwhelming feelings from situations I've never been in. And I am afraid that somewhere out there, someone is having that same experience... of me."

Ahmadi took in a long, deep breath, and let it out slowly. Her expression was somber.

"I'm going to ask you if I can use your name," Ahmadi said. Then, "May I call you by your given name?"

Tanaka nodded. For some reason it was difficult to talk. Something was wrong with her throat.

"Aliana? I am going to ask you if I can take your hand. May I take your hand?"

"Yes," Tanaka said, but it was barely a whisper.

The thick, matronly woman leaned forward. Her fingers were strong, her skin was dry. Tanaka shuddered.

"Aliana, I feel that you are describing intimate assault."

“No one touched me.”

“You have a very important, very private personal boundary. It was violated without your permission or consent. Is that right? Please, if I’m wrong, say. I want to understand.”

“They’re in my mind. I can’t keep them out. They’re going to know things that *they can’t know*.” She thought that her voice sounded very calm, all things considered. Ahmadi nodded.

“And you’re telling me that this... thing. It’s ongoing? It’s still happening right now?”

Tanaka felt herself still. Ahmadi let go of her hand and walked smoothly backward until her desk was between them. The psychiatrist’s eyes were wide and her cheeks were flushed. Prey response. Whatever training the woman had gone through, it had made her sensitive enough to recognize danger. For a moment, Tanaka considered all the ways that she could kill the woman. There were several. None of them would put her in any physical danger, and two of them would be cathartic.

For a moment, the other selves were quiet too, as if they were just as frightened as the head shrinker. That was interesting, but it was for later. Now, in this room, Tanaka spread her hands, palms out and fingers splayed. The universal gesture for *I’m unarmed*. Ahmadi didn’t come back around her desk. Smart woman.

“I believe you have understood the situation,” Tanaka said, as carefully as if the syllables could cut her lips.

“I can see why you’ve been struggling. That sounds... terrible.”

“It is. Can you fix it?”

“There are some things I think we can try—”

Tanaka waved the words away, and Ahmadi went quiet. “I have to stop this. I can’t feel this anymore. Do you understand?”

“I do.”

The other woman licked her lips, and Tanaka had the visceral memory of someone who looked similar but with a broader face and a higher hairline, doing the same thing. She pushed the thought away.

“There may be some interventions,” Ahmadi said. “There are medicines that we use to reduce intrusive thoughts. Assuming the mechanism is similar, they could be very effective.”

“Good.”

“If inpatient care is an option for you, there are some focused magnetic treatments that we could try. Things that can blunt your experience.”

“But not stop it.”

“I don’t know what it is,” she said. “I will help you find out, though. I promise you that, Aliana. As terrible as this is, you don’t have to go through it alone.”

She didn’t see the irony in her choice of phrase, and Tanaka wasn’t in the mood to walk her through it. Her body felt like she’d had a bad virus. Weary until her muscles were falling off her bones. The storm in her head was still there, but not overwhelming at the moment. She didn’t trust that. Being tired made her vulnerable and weak. It didn’t make her free from the others.

“Let’s try the medications first,” she said.

“I’ll have them for you right away.”

Tanaka stood up. The station swayed under her, and she wanted nothing more than to close her eyes. “I think that’s enough for today.”

“We still have time, if you want to—”

“I think that’s enough for today. Have the medications delivered to my quarters here on the station. I’ll take them.”

“I’d like to see you again.” It was a bold statement, and they both knew it. Tanaka lowered her head. Ahmadi squared her shoulders. When she spoke, her voice was lower, calmer, more reassuring, more like it had been when Tanaka had first come in the office. “You are in crisis right now. But you’re also an incredibly strong person. You’ve never met anything that could stop you before, so you believe you can grit your teeth and force your way through it. And truthfully, you probably can. But Aliana, you can’t heal from this. Not without help.”

When Tanaka spoke, it was deliberately using the other woman’s cadence and intonation. Not quite mocking her, not quite not. “You believe I am suffering an ongoing, unstoppable intimate assault.”

“I do.”

“And you think that’s something I can heal from?”

“I would like to help you.”

“I would like to be helped,” Tanaka said. “Send me the pills. We’ll go from there.”

The station was unfamiliar enough to hold her attention. The puzzle of reading the signs, finding her way to the transport tubes, picking the right lift to get her to her quarters, all kept her from thinking too much about anything else. When she got there, things were worse.

Her rooms were simple, spare, and elegant. The color scheme was mostly a dusty red designed to highlight the splashes of Laconian blue. The decoration was minimalist and tasteful: a calligraphic print of a passage of the high consul's writings, a crystal vase with a single flower in it that was replaced each day by the staff, a floor covering designed to evoke tatami mats. There was nothing in it to distract her from her impulses and thoughts.

She ordered food to the room: curried fish and a dry white wine. Someone in her head remembered an apartment with blue-green walls of chipping paint and a couch made from foam and cloth. It was a happy memory, but Tanaka didn't know why. Someone else had eaten a bad fish curry, and the echo of a night recovering from food poisoning wafted through her awareness and vanished again, thin as cigarette smoke.

The medication arrived at almost the same time as the food. A glassine packet with ten peach-colored pills in it and the printed directions to take one each morning and to avoid alcohol. She dry-swallowed two of them, then chased them with a long swig from the wine bottle. The curry was punishingly hot, just as she'd hoped. It gave her an excuse to polish off the wine. By the time she was finished, a deep ache was growing at the base of her skull, but she had the sense that the memories and thoughts were a little less, the voices a little quieter.

The room's system chimed. A connection request from the *Derecho*. She checked her hand terminal. There were half a dozen messages from Botton queued there, but she'd forgotten to take off her privacy settings after Ahmadi. She turned them off now and accepted the connection through the room. A wall screen came to life, and Botton's head filled it.

"Colonel," he said. "I am very sorry to interrupt. I wouldn't if you

hadn't specifically asked for immediate updates."

Had she asked for immediate updates? She didn't remember doing it, but it sounded like something she would have done. The ache at the base of her skull grew a little more intense.

"It's fine," she said. "What seems to be the problem?"

"We had a high-priority report from the Science Directorate on Laconia. Dr. Ochida's office flagged it as critical."

"What did it say?"

Botton blinked. "I don't know, Colonel. I'm not cleared."

She knew that. She should have known. "Of course. Send it to me. I'll take it here."

"Colonel," the captain said, and then vanished. He was replaced with an encrypted datafile. As she ran the decryption, she wondered what the effect of alcohol was on her new medication. If it beat the hell out of her liver and kidneys, it might still be worth the damage. If it made the meds less effective, though...

She ordered another bottle of wine anyway.

Ochida appeared on the screen. He looked as clean and crisp as ever. She recognized the room he was in. Not the Science Directorate, but the State Building. That meant whatever he was telling her, he'd likely already told Trejo.

"Colonel," he said. "I hope you're well."

"Fuck you," Tanaka said to the recording with a polite nod.

"We were feeding the data you sent us through the virtual intelligence and pattern-matching systems here, and we came up with something interesting. Take a look at this."

The screen jumped. Where Ochida had been, there was the ring space. Telescopic images, tactical map, scatter data. She didn't need to look at the time stamp. She recognized the sequence like it was a well-studied painting. It was the gap between when the *Derecho* had entered the ring space and the transit of the *Preiss*. It was the last few moments that her mind had been her own.

The images ticked forward frame by frame, slowed down by the analytic software. She watched the ships inch forward in their arcs, the tactical display tracking each of them. The dissipating drive plume into Bara Gaon that had misled her. The flicker of the *Preiss*'s drive as it began to go

dutchman. And then whiteness. The annihilating brightness of a thousand rings bursting into light.

Not just the rings, though.

Tanaka sat forward. The data images shifted, bringing the ring station at the center of the space into clearer focus. It was glowing with a sudden, violent brightness just like the rings. The visual telescope shifted closer, diving in toward the surface of the station. There was a flaw there. A dark spot like dust on the lens. Or no, not that. Something on the surface of the station itself. The weird patterning of the structure made it hard to make sense of until the virtual intelligence stripped out the background.

It was a small, dark oval. An overlay gave a sense of scale. Not large at all. Smaller than her quarters on Gewitter. The adrenaline hit her system even before the comparison image came up. The egg-shaped ships from the grotto on Laconia. And the match certainty: 98.7 percent.

“You son of a bitch,” she whispered. “There you are.”

Chapter Thirty-Two: Kit

Many, many things were known, but some were bright and immediate. Fortuna Sittard was both capital city and company town. The hexagon/pentagon tessellation of the Nieuwestad logo really was inspired by the surface of a football. The city was less than ten years old, but already half a million people lived there at the edge of a massive tectonic escarpment where the highland rivers were cutting valleys as they flowed down toward the southern sea. The morning sun would come through the windows and spill across the ceiling over the bed, every imperfection in the surface throwing a tiny shadow in the rose-colored light.

There were other things, less bright but just as much known. A coffeehouse in Toronto where a man and woman had said goodbye for the last time, and the way the scent of baked apple would still make her cry sometimes. A recurring pain in a chest that the doctors called idiopathic angina but that carried all the fear and threat of heart attacks. The pattern of an old melody on piano keys adapted because the left hand was missing a pinkie. The spilling grammars of Italian and Czech. A great wash of memory and significance and knowledge, there but grayer somehow. Lapping like the little waves at the edge of a lake.

Eyes opened and saw where the shadows would be. Legs shifted out from under a blanket, but they weren't anyone's legs. They just were. A woman muttered in her sleep, dreaming that she was in a dance recital and had forgotten all the moves. The toilet was a few steps away, and for a moment there were other toilets to reach from other rooms. Some on the left, some on the right, some down the hallway or the stairs. More than a few built into the wall of the ship's cabin, complete with vacuum flow for when the drive was off and everything was on the float.

Nearby, a finger touched the light switch, and a glow filled the air. A hand fumbled with a warm, soft penis, and urine spilled down to the white

ceramic bowl. There was relief, and then soap and warm water and the light put out.

A child slept in the nursery. He was already large for his crib. That was a known thing. And farther, but not too far, there was a daughter already getting up for work, her attempts to be quiet more alerting than outright noise would be. And there was no one in the house but silence and the thumb-sized grubs they call “cricket slugs” on Pathé. And ships’ drives hummed and thrummed—all the ships’ drives in chorus like cicadas.

The hand that had touched the light switch pulled aside the curtains. The window had spots on it where old raindrops dried, and beyond that, the stars. A woman’s voice said *Kit?* and more eyes opened. A naked man stood at the window, looking out at the night, but something was very wrong with him—right, but not right. Familiar, but unfamiliar. Reversed, because he wasn’t in the mirror and then he wasn’t the person who saw himself in the mirror and then he was.

“Kit?” Rohi said again, and Kit fell back into himself like he’d jumped off a building. His head spun as he staggered to the toilet, dropped to his knees, and vomited into the bowl. When he was empty, he retched for a while, each spasm more painful than the one before, but slowly gaining more time between them. Bakari was crying and Rohi was singing to their boy, soothing him, cooing to him that everything was all right.

Eventually the vertigo passed, and Kit was himself again. In the planetary gravity of Nieuwestad his body felt heavy in a way that somehow felt different than acceleration on a ship, even though Einstein had proven it wasn’t. He washed out his mouth at the little metal sink and walked back to the bedroom. Rohi was curled on the pillows, Bakari asleep in the crook of her arm with his closed eyes shifting in a dream. Kit’s skin stippled itself with gooseflesh from the cold, and he pulled on a set of thermal underwear. He didn’t have pajamas.

It had started on the *Preiss*. It had started the moment they’d died. Kit didn’t say it, but he was sure that was what had happened. The dark things, more real than anything real, had blown him and his baby away like handfuls of dust in a high wind. That was death. And then their clock had been inverted. They hadn’t been reborn, but un-killed. The man who wasn’t in the room with them had managed it with a vast effort. An effort that had exhausted him. Kit had been disoriented, grateful, confused, frightened.

He'd been lost for a flashbulb moment in a cacophony of memory and identity and sensation.

And there had been voices. Not real ones, not words. He wasn't developing aural hallucinations. But he'd remembered things, known things from lives he hadn't led. While they were questioned by the Laconians from the *Derecho*, when they'd been released to finish the journey to Nieuwestad, even for a time after they'd arrived and been escorted to the orientation campus.

The thing where he lost the idea of Kit in a stream of consciousness that wasn't his? This was new. It had only come a few times, but afterward he felt thinner and less connected to reality. Like the essential self he'd always known—the thing he meant when he said “I”—turned out to be less an object and more a kind of habit. Not even a persistent habit like taking drugs or gambling. The kind of thing you could take or leave. Coffee with breakfast instead of tea. Buying the same kinds of socks. Existing as an individual. All things he could do or not do without much changing. Another wave of nausea rolled through him with the thought, but it faded.

He slipped into the bed, trying not to wake them. Bakari was a warm, soft stone. Nothing short of Armageddon was going to wake him now. Rohi didn't open her eyes, didn't shift on the mattress. He was almost able to convince himself she was asleep when she spoke.

“Are you all right?”

“You were at a dance recital,” he said, softly. “But you'd forgotten all the choreography. You had to improvise it all on the fly, and it wasn't going right.”

She was silent for a while. “It's getting worse, isn't it? It's happening more often.”

Kit sighed. On the ceiling above them, the first faint shadows were starting to form. “Yeah.”

“For me too,” she said.

The first two weeks of orientation had been held in a wide auditorium large enough to seat three thousand, though there were fewer than six hundred new immigrants in their cohort. The stage was set a little off-center to give over one wall to vast windows that looked out over the escarpment. The local tree analogs were complexes of mosslike growths that built up like vast coral reefs, and they shimmered silver to green to ruddy orange depending on the temperature and the direction of the wind.

With Bakari in the company daycare facility, Kit's mornings had been presentations by the Jacobin-Black Combined Capital welcome team and representatives of the unions talking about Nieuwestad as a planet and Fortuna Sittard as a city. They would have sixteen-month years and thirty-two-hour days. The local biosphere relied on compounds that weren't toxic but could be irritating, so keeping inside the sealed areas of the city was recommended. They got maps of the city—commissary, medical complex, entertainment district, public swimming pool, religious facilities. The procedures for reporting legal infractions to security, and security infractions to the union reps, were detailed, and Kit and Rohi had to mark that they'd been briefed and understood. The JBCC welcome team led them in songs about teamwork and fellowship, and even the union reps joined in.

With Rohi at his side, Kit felt a little bit grounded in the sea of new voices and faces, the disorienting prospect of the life his new contract had created for him. There might be hundreds of new faces and all the displacing details of coming to live in a new city on a new planet, but Rohi was there, and she was his anchor.

The third week, with his feet a little more nearly under him, he started his workgroup orientation, and Rohi started hers. Halfway through the first day, he realized it was the longest he'd spent away from her since they'd boarded the *Preiss* back in Sol system.

There were only six people joining the civil engineering team. They met in a classroom that looked like a hundred classrooms he'd been in before—thin industrial carpet with a pattern to hide stains, sound-absorbing hardfoam walls, recessed lighting that was cheap because everyone everywhere used printed parts from the same design. His new superior was an attractive woman named Himemiya Gosset. She had a tight smile and a habit of stroking her chin when she was thinking, and Kit realized halfway through the second day that he'd read an article she'd written about the use

of local materials in large-scale water recycling plants. Slowly, the unease and wariness and bone-deep sense of displacement started to give way to enthusiasm and even excitement about the work he'd be doing.

It was the middle of the third day and Gosset was preparing to take the six of them over to the offices where they'd be assigned workstations and meet the full engineering team, when a security officer stepped in the little classroom and pulled her aside. Their conversation was brief, but it brought visible distress to the senior engineer's face. Kit knew before she turned back to the classroom that something had happened, and that it had to do with him.

"Kamal?" Gosset said. "Word, please."

Kit stepped over to the pair of them. The other five were quiet behind him.

"There's a medical issue," the security man said. "I can take you to the infirmary."

"Rohi?" Kit asked.

"It's your son, sir. I'm afraid he's been taken to the infirmary. You should come now."

"Is he all right?" Kit said, but the security man didn't answer.

Gosset nodded sharply toward the door. The universal gesture for *Go*. "Don't worry about missing the walk-through. We'll get you caught up later."

"Thank you," Kit said by reflex. He wasn't paying attention to her. Something was wrong with Bakari. His heart was bright and fast, and he could feel his pulse in his neck.

He held back the urge to ask the security man what had happened, when it had happened, what was wrong, how they knew it was wrong, what they'd done about it, and the thousand other things the man didn't know. Instead, he sat in the small electric cart as it zipped through the wide concrete-and-conduit access corridors of the city, and leaned forward as if he could will it to go faster.

The infirmary was mostly underground, but the lights were tuned to a spectrum that mimicked the afternoon sun of Earth. The flowers at the intake station were fake, but they smelled real. The security man walked behind Kit like an apology. Even before Kit reached the reception desk, an older man in a doctor's coat was striding out toward them. Kit was

expected.

“Mr. Kamal,” the doctor said, gesturing toward a pair of pale wooden doors. “This way, please.”

“What happened?” Kit asked.

Instead of answering, the doctor turned to the security man and said, “Thank you very much.” It was polite, but it was a dismissal. Kit had the sense that whatever the conversation was, it would be private. Maybe that was company policy for JBCC. Maybe it was something else.

They pushed through the doors and into the halls of the infirmary. They were wider than standard, wide enough to let two hospital beds pass each other with room for medics at their sides. The floral smell of reception gave way to something harsher.

“Your son is stable,” the doctor said. “The daycare watch reported that he was acting strangely. For a time, he became entirely unresponsive.”

“I don’t know what that means,” Kit said.

“I believe he had a seizure of some kind. My preliminary scans don’t show any congenital abnormalities or tumors, so that’s good. But there was... some odd activity in his insular cortex.”

“But he’s okay?”

“He’s fine now,” the doctor said. “We’re going to watch him, and I would like to run a few tests. Just rule out as much as I can.”

“But he’s going to be okay.” Kit didn’t say it as a question. He asserted it as if the universe would take its directions from him.

The doctor stopped, and Kit went on for another two steps before he paused and turned back. The discomfort on the doctor’s face was plain.

“We have a standing order from the Laconian Science Directorate. Any issues or abnormalities that arise among people who were on the *Preiss* are to be documented and the data sent to Laconia.”

“Because of the thing that happened?” Kit said.

“There are thirteen hundred systems. Laconia doesn’t even have a formal political officer on Nieuwestad,” the doctor said. “If the report back to Dr. Ochida slipped behind my desk? It could be months or years before I noticed. Given who your father is, I thought perhaps...”

The doctor inclined his head. He was graying at the temples, and deep wrinkles marked the corners of his eyes and mouth. He was old enough; he might have known the *Rocinante* before the Transport Union was even

formed. He might be part of Naomi Nagata's underground movement.

"Thank you," Kit said.

The doctor's smile was calm and calming. He led Kit to a glass doorway where the privacy setting had turned the clear pane to a gentle frost. Kit slipped in. The soft hum and pop of the medical scanners was like wind in trees. The bed was sized for an adult, and Rohi lay on her side with Bakari snuggled up to her chest. His eyes were closed, and his right hand was curled in a fist under his chin as if he were deep in thought. Her voice was soft and lilting. The cadence she fell into when she was lulling the baby to sleep.

"The Anteater said, 'Of course we're friends. Why would we not be?' And the cunning clever boy who looked just like Bakari said, 'Because you eat ants, and the anthill is made from them.'"

Kit eased himself onto the foot of the bed, resting his hand on her ankle. She smiled and went on.

"'You are made from many things too,' the Anteater said. 'You are made up of skin and hair and eyes and bones and blood and wide, strong muscles. Do you hate the doctor when he takes a blood sample to keep you well? Do you hate the barber when he cuts off a bit of your hair? I love the anthill because it helps me live, and it loves me because I help keep it healthy by taking away the ants that are worn out. Just because you're made from something, that doesn't mean that's all you are.' And then the clever young boy who looked just like Bakari understood. And that's the end of the story."

Rohi lapsed into silence. Bakari sighed softly and nuzzled more deeply into the bed. He looked fine. He looked healthy.

"I don't know that story," Kit said. "Where's it from?"

"Aesop?" Rohi said.

"I don't think so."

"Maybe I made it up. I don't know anymore."

I think it was a philosopher, a voice in the back of Kit's mind murmurs. I can't remember his name. The voice isn't Kit's. It isn't anyone he recognizes, but he remembers the book—orange with a complex design on the front and thin pages of high-quality paper. It isn't a book he's read. There was a time when these wandering memories bothered him. Now they seem almost normal. *That which can't be avoided must be embraced.*

Someone had said that to him. His grandmother. Kit had never met his grandmother. The room around him spun a little, but only a little.

“Can you imagine what it would be like?” Rohi asked. “It’s hard enough for us, and we already know ourselves. I’ve been me for decades. Imagine being as little as him. Still figuring out where your body ends and the world begins, and having to deal with... this.”

“We don’t know it’s that.”

“We can’t prove it,” Rohi said. “But I know. Don’t you?”
